**Holborn.**—A very successful gathering was held on the 20th inst., when the American loan set of lantern slides were thrown on the screen. About fifty members and friends were present, and all seemed to enjoy the treat provided for them, then followed the prize slides in the lantern slide competition. After several members had had a few passed through the lantern, the whole company adjourned to the room (which had been kindly placed at the disposal of the Committee by Mr. W. Smeed), where the prizes were displayed. Mr. S. T. Chang, in the unavoidable absence of the President, distributed the prizes to the successful competitors. "For the most numerous and meritorious set of picture"—1st prize, a very artistic statuette of an ancient warrior, won by Mr. Fred. Brocas; 2nd, a Thornton-Pickard shutter, won by Miss Lucy Hare; 3rd, a Watkins exposure meter, won by Mr. Golding. "For the six best quarter-plate pictures"—1st prize, a hand-bag, won by Mr. Osborne; 2nd, a pneumatic shutter, won by Mr. Phillips. "For the best enlargement"—A print washer, won by Mr. Smith. "Ladies' prize"—A Thornton-Pickard shutter, won by Mrs. Smith. "Lantern slides"—3rd prize, a photographic album, won by Mr. Bayston; 2nd, a Gladstone bag, won by Mr. Beckford; 1st, an Optimus lantern, with five-inch condensers, won by Mr. S. T. Chang. This gentleman, in a very neat speech, presented his prize to the Club, remarking that his idea in entering the competition was only to benefit the Holborn Camera Club. Mr. Brocas, in accepting on behalf of the Club, the lantern, said that the members were determined that Mr. Chang should not go away empty-handed, and they had combined and bought a small morocco letter case, which he hoped that Mr. Chang would accept, and that he would always remember, whether he was here or in China, the Holborn Camera Club. Several members contributed to the further enjoyment of those present, by some songs and recitations, and all finished up by singing "Auld Lang Syne."

**Leeds.**—On the 16th inst. Mr. Godfrey Bingley, the President, gave the third of the series of elementary lectures, his subject being "Albumen and Aristotype Printing." Mr. T. W. Thornton, Vice-President, occupied the chair. Mr. Bingley said that printing and toning, although simple photographic operations, often proved difficult to beginners. A good print could, of course, only be obtained from a good negative; weak and thin negatives were often the cause of bad prints. The best light in which to print was bright diffused light. Speaking of albumen printing, Mr. Bingley said that if purple tones were required, the washing previous to toning should not be as thorough as for sepia tones. With respect to the toning bath, per-

haps that known as the "borax" bath was best for a beginner; it should be used soon after being made, and it was best to prepare a fresh bath for each batch of prints. The slower prints toned, the better the tone; and the more gold taken up by the print, the greater the chance of permanency; over-toned prints were flat and slatey in colour. The fixing solution should consist of hyposulphite of soda, 3 oz. to the pint of water, and at least ten minutes should be given in the fixing bath. Blistering, which sometimes took place, could be prevented by adding 1 drm. of ammonia or 1 oz. of methylated alcohol to each pint of fixing bath. In speaking of aristotype or gelatino-chloride paper for printing, Mr. Bingley observed that this paper keeps better than albumenised paper; it is somewhat higher in price, but the results are finer. Printing is done in the ordinary way, the action of the light being carried on until the shadows assume a bronzed appearance; after printing, only a few minutes' washing is required, after which the print may be placed in the toning solution. The toning bath giving the best results is composed as follows:—

Sulphocyanide of ammonium	...	...	...	3 drm.
Hypsulphite of soda	...	...	...	7 gr.
Water	...	...	...	20 oz.

To 3 oz. of the above solution add 3 oz. of water containing 2 gr. of chloride of gold, and when clear make up to 8 oz. with water; this will tone one sheet of paper. The prints tone quickly, and when a rich purple has been reached they should they should be removed at once to the fixing bath, consisting of hyposulphite of soda 2 oz. to the pint, and allowed to remain ten minutes or until the print is an even colour; on no account must the fixing solution touch an un-toned print. After toning, the prints are washed for three or four hours, care being taken not to crease them in washing. They may then be dried in the ordinary way, or in contact with glass, according to the surface it is desired to give to the print. Mr. Bingley handed round a large number of prints illustrating the processes with which he had been dealing.

**Lewisham.**—On the 20th inst., Mr. E. Eastwood in the chair, Mr. Charles W. Hastings showed the AMATEUR PHOTOGRAPHER 1890 Prize Slides to a large and enthusiastic audience. The pictures were for the most part of the very highest order, and were much admired, and Mr. Hastings' admirable description added greatly to the enjoyment of the evening. The next meeting, which was by requisition made special and general, will be held on April 3rd, when the annual election of officers takes place.

**North London.**—The annual exhibition of members' pictures and display of lantern slides took place on the 17th inst., the meeting being held in the large Wellington Hall, which had been tastefully arranged by a small sub-committee, and a large number of the friends of the members attended by invitation ticket. There was not such a large display of exhibits as had been shown in previous years, owing to the fact that many of the members were exhibiting elsewhere, but many of the pictures shown had been very carefully prepared. The pictures were of all sizes, from the quarter-plate hand-camera pictures up to very large size, and handsomely framed enlargements, and the various printing processes were well illustrated, showing how any process if carefully handled lends itself to picture-making. Mr. Grover presided at the lantern, and the pictures were projected on to a screen kindly lent and erected by Mr. Bishop. There were two exhibitions of slides during the evening, and these had been carefully selected by the sub-committee. It is hoped that there will be a full attendance at the meeting on April 7th, as Mr. A. P. Wire, the Hon. Librarian of the Essex Field Club, will then give his popular lecture on "Visions of the Past," historical incidents connected with East London and South-West Essex, illustrated by views shown by the optical lantern, many being copies of old prints.

**Richmond.**—On Friday the 20th inst., there was a good muster to discuss "Development and Developers." Mr. Ennis presided. The subject was very ably introduced by Mr. Ardaseer, who touched upon the theory of the action of light upon the sensitive surface and of the development of the latent image, noticed the different action in the development of wet and dry plates, explained the functions of the different ingredients employed, and enlarged upon the advantages of slow development, of re-development in certain cases, and of the judicious use of certain dodges, such as the use of the brush, intentional fogging and intentional staining, and others. Mr. Cembrano mentioned that he had used with advantage in cases of under-exposure, re-development with hydroquinone after eikonogen, the latter giving detail, the former density. Other members continued the discussion, which proved interesting throughout.

**Sheffield (Optical Lantern).**—The monthly meeting was held on the 19th inst., under the presidency of Mr. H. Staniforth. Mr. P. Slater gave a demonstration on the development of negatives, which was highly appreciated by the members. Messrs. Stephenson, Frith, and Stephens were elected a sub-committee to make arrangements for the summer excursions. Dr. Manton promised to read a paper on the "Carbon Process" at the April meeting.

**Southport.**—At the meeting on the 11th inst., Mr. George R.

Cartmel, Secretary, gave a very successful demonstration on "Bromide Printing." The 18th inst. was a "Lantern Night." Upwards of 150 slides, mostly made by members, were shown. "Snow and Hoar Frost Scenes," by Mr. Dunmore (President), and "Portraits of Children," by Mr. Parkes, were much admired. Some comic slides by Mr. Cartmel were the cause of much merriment.

**South London.**—On the 20th inst. Mr. Gambier Bolton, F.Z.S., gave his promised lecture on "Zoological Photography," and although the night was somewhat stormy, over 200 members and friends were present. Needless to say, the slides were perfect, the peculiarities of each animal being capitally brought out. The lecture, which was interspersed with a number of interesting facts connected with the animals, was most entertaining, and although 100 slides were passed through the lantern, the audience, like *Oliver Twist*, craved for more. There were frequent bursts of applause throughout the evening, and the lecturer was most heartily received.

**Spenn Valley.**—The March meeting of this society was held on the 10th inst., at the Coffee Tavern, Dr. Farrow (President) in the chair. There was a moderate assemblage of members, and Mr. Eli Hirst read a paper on "Enlarging Processes," which was followed by an interesting discussion, not confined simply to the subject of the paper, but dealing with M. Lippmann's so-called "discovery" of photography in colours, and other matters.

**Sydenham.**—A meeting was held on the 17th inst., the President, Mr. C. D. Budd, in the chair. After the general business was disposed of, Mr. T. W. Rumble read a paper on "Developers and Developing," in which the advantages and disadvantages of pyro, quinone, and eikonogen respectively, were compared in the fullest and most comprehensive manner, and the balance ultimately struck in favour of pyro. Mr. Rumble closed his remarks by addressing himself especially to those members not far advanced in photography, and, after warning them against running from one system to another, strongly advised them to thoroughly master one developer before attempting another. At the end of the paper questions were asked and answered, and a general discussion followed, in which most of the members took part.

**Sutton.**—At the meeting on the 3rd inst. (Mr. De Clyford in the chair), after the ordinary business was disposed of, a pleasant hour was spent inspecting the box of Monthly Competition prints lent by the Editor of the AMATEUR PHOTOGRAPHER, consisting of "Genre and Figure Studies." The competition subjects for the summer session were arranged, and will consist principally of Surrey views, a prize to be awarded at the termination of six months, from April to September inclusive.

**Wakefield.**—On the 20th inst. there was a meeting of amateurs at the City Chambers, Wood Street, convened by Mr. G. F. Firth, of Oak Leigh, to consider the desirability of forming a society for the district. It was resolved to form the Wakefield and District Photographic Society. The subscription was fixed at 7s. 6d. for adults and 5s. for youths, and a provisional committee appointed. Messrs. G. F. Firth and Halliwell were appointed joint Hon. Secretaries.

**West London.**—On the 20th inst., the President (Mr. W. A. Brown) in the chair, letters and papers from Mr. Biden on the subject of the federation scheme were read, and remarks made by the President, followed by a long discussion, after which it was resolved to send delegates to the meeting on the 23rd inst. with discretionary powers. Mr. C. Whiting then read his paper, repeated by special desire, on "Lantern-Slide making by the Wet Collodion Process." The paper was followed by a practical demonstration, one exposure being made in the camera, and two by contact. The processes of coating the plates, sensitising, exposure, development, intensification, fixing, and toning were watched with great interest by a large number of members, and numerous questions were put to and answered by Mr. Whiting, who afterwards explained the method of printing in clouds. A very hearty vote of thanks was accorded to the lecturer. The President then, in the name of the Society, presented the late Hon. Sec., Mr. John A. Hodges, with a lens (by Taylor and Hobson, with Iris diaphragm) with a suitable inscription. He made a few flattering remarks on Mr. Hodges' past services to the Society, and Mr. Hodges warmly thanked the Society for the testimonial. After a few remarks from the new Secretary the proceedings terminated.

**West Surrey.**—The usual fortnightly meeting was held on the 18th inst. Mr. Geo. Davison (Vice-President), occupied the chair, about fifty-five members being present. Messrs. W. M. Chinnery and Percy M. Thornton consented to become patrons. After the ordinary business had been got through, Mr. Gale, the President, read an exceedingly interesting paper upon the effects of the different seasons from a photographic point of view, illustrating his remarks by an exhibition of transparencies, all made by the wet collodion process, some as long ago as twenty to twenty-five years, including some of the very best of Mr. Gale's work. The next meeting will be held on Wednesday, April 1st, at 8 30 p.m. Visitors are invited.

**Wigan.**—A meeting of this Society was held on the 19th inst., when the AMATEUR PHOTOGRAPHER 1890 Prize Lantern-slides were

exhibited. Mr. J. Hodgson, one of the members, provided a splendid light, working the ether saturator of his own design and construction, which showed the slides to perfection. Several slides elicited applause from the members and friends present, the architecture coming in for the largest share, and taken as a whole they were voted a very fine set. Messrs. J. Hinchcliffe and W. Garnett were elected members, and Messrs. Lamont and H. O. Timmins were proposed. The Hon. Sec. distributed samples of Scholzig's matt-surface and albumenised papers, and Jacoby's chloride of silver, and platina papers kindly sent by Mr. Otto Scholzig.

## Quarterly Examinations in Photography.

**Question 25.** (The best results were obtained by "Sunesis" and "Developoid.")

**Question 26.**—What are the arguments for and against the adoption of the metric system of weights and measures?

**ANSWER.**—Arguments for the Metric System.—(1) A simple, definite arrangement exists between its units of length, weight, and capacity.

(2) The multiples and submultiples of these units are extremely simple, being based on a decimal system, the multiples being unit multiplied by 10, 100, or 1,000, and the submultiples being divided by the same figures.

(3) The names of the multiples and submultiples are very easy to remember, the multiples being the name of the unit prefixed by deca, hecto, or kilo, whilst the submultiples take the Latin prefixes deci, centi, and milli.

(4) Being based on the decimal system, the reduction of one weight or measure into other weights or measures is very simple, all that is necessary being to move the decimal point to the right or left, according as submultiples or multiples of the originals are required.

(5) The multiples and submultiples of the unit of length have a simple definite relationship to the multiples and submultiples of the units of weight and capacity, and vice versa.

In English system an ounce of water at 62 deg. F. equals one ounce of fluid measure, but one ounce of water by weight equals 437½ grains, whilst the division of the same amount of water into minims divides it into 480 parts, therefore no simple relationship exists between the grain and the minim, the former equalling 1·097 minims.

**Disadvantages of the Metric System.** The only disadvantage of this system is that it requires a thorough knowledge of decimal fractions, probably a better knowledge than most grown-up amateurs possess.

Division of decimals is particularly "catchy," and consequently leads to many mistakes in converting one system into the other. Another seeming argument against it is that to English people it necessitates knowing two essentially different tables of weights and measures.

**Question 27.**—Give the formulæ for conversion of metric weights into English weights, and vice versa; and what is the recommendation of the Photographic Convention as to the bulk of stock solution formulæ and their strength?

**ANSWER.**—To convert metric into English weights, first reduce to grammes and multiply by 15·432, and the product will be in grains.

To convert English weights into metric weights, first reduce to grains, and then divide by 15·432, when the quotient will be in grammes.

**Recommendations of Photographic Convention.**—(1) Formulæ should be in (1) grammes and cubic centimetres, (2) grains and fluid grains, (3) ounces and fluid ounces.

(2) Standard temperatures should be 15 deg. Cent.

(3) Formulæ should show proportions of constituents in a certain volume of a finished solution, and not so much by weight in so much measure of the solvent.

(4) Formulæ should distinctly state whether the amount of solvent is by measure or by weight, especially if the solvent be any other than water.

(5) Formulæ should make up to 10, 100, or 1,000 parts.

(6) If separate solutions have to be mixed just before use (as a developer), their strength should be so regulated that their proportions may be as simple as possible, say 1 to 2, 1 to 3, etc.

(7) In using "metric system" formulæ never use the contracted "gram," as it may be read for "grain." Always employ the full French word "gramme."

LINDUM.

**A Good Cold Varnish** may be made by dissolving—

Pyroxylin	...	...	...	...	3 grammes.
In acetate of amyl	...	...	...	...	100 cc.

This requires about 12 to 24 hours to completely dry.

## Apparatus.

### LENS MANUFACTURE AT LEICESTER.

THE WORKS OF MESSRS. TAYLOR, TAYLOR, AND HOBSON.

FOUR years ago we devoted some space in the columns of the AMATEUR PHOTOGRAPHER to giving a notice on the method of manufacturing lenses at the works of the Messrs. Taylor; since that time the business has grown enormously, and Taylor's lenses are known all over the world. Having had the privilege of inspecting the firm's extensive works at Leicester we will make an effort to describe for the benefit of our readers what we saw; but we cannot, in the limited space at our disposal, do justice to the description of each process that the lens passes through, which was so courteously accorded us by Mr. W. Taylor, during our visit of inspection.

The works in Slate Street are near the railway station, and consist of a very substantial three-storey building. The ground floor is arranged as foundry, smith's shop, fitting shop, etc.; much of the work done on this floor is for special tools and machines, a speciality of the firm being an engraving machine now extensively used for all kinds of engraving work, and by the firm for engraving lenses, diaphragms, etc. Anyone interested in mechanics would find occupation and instruction in these shops alone for days. Here the master screw tools are made and dividing machines, also the lathe tools in use in the firm's own shops, as well as many machines for the manufacture of scientific apparatus.

On the first floor are extensive and well-lighted offices, show-rooms, and stock rooms. It may be well at once to describe a few of the lenses and other apparatus turned out by the firm. In the first place we should state that ever since Messrs. Taylor started in business they "set their face as a flint" to the perfecting of standard screws, and have now a system unequalled and by which they can ensure interchangeability of any of their lenses.

In fig. 1 we have a double combination R.R. lens with iris diaphragm; the screws of these lenses are so cut that the  $f$  value of the diaphragm is always seen on the same side of the lens. The angle of view of this lens is from 40 to 50 deg., and the full working aperture  $f/8$ . Fig. 2 is a wide angle rectilinear lens, double combination, which include an angle of from 75 to 80 degrees; they are fitted with rotating Waterhouse diaphragm. The full working aperture is  $f/16$ . In fig. 3 we show a rapid-view lens, single combination, which the makers say, "are

FIG. 1.

of the form now universally recognised as the best for landscape work; for having few surfaces to reflect stray light, the images formed are in this respect more perfect than those formed by double combination lenses." The angle of view is about 40 deg., the lens is fitted with Iris diaphragm, and the full working aperture is  $f/11\cdot3$ . Although not recommended, lenses of this series are supplied with full aperture  $f/8$ . A lens of this class to cover 6½ by 4½ with iris diaphragm is supplied for £1 18s.

Other lenses made by the firm are, wide-angle rectilinear, wide-angle view, rapid portrait, full working

FIG. 2.

aperture  $f/8$ , and lenses for detective or fixed focus cameras. Fig. 4 shows the detective lens, double combination No. 1, 4 in. focus, covering 3½ by 3½, and No. 2, 5 in. focus, covering 4½ by 3½, work at  $f/5\cdot6$ , and are well known as being first-class lenses for hand-camera work. Fig. 5 shows us Shew's patent shutter working between the combinations, having variable speed.

Messrs. Taylors have paid much attention to lantern objectives. It will be remembered that those used last year at the Crystal Palace were supplied by them. They are able to cover a

FIG. 3.

FIG. 4.

in Messrs. Taylor's list. In sundries we have a capital hooded finder, focussing magnifiers, levels, standard screw adapters, etc., all made to do their work perfectly.

Recently Messrs. Taylor have taken up the sole English agency for the goods of the Blair Camera Company of Boston, U.S.A. We had the opportunity of inspecting the goods, and give an illustration (fig. 7) of the Blair Compact camera, which is well made, is "erected by two motions," has "ample swing," "extends to twice its focus," "back frame reverses," and it is set upon a "neat turntable." With the camera are sent out Featherweight double plate or film holders. These are worth seeing, and so is the Hawkeye hand-camera.

Having briefly referred to the goods manufactured by Messrs. Taylor, we will pass into the works themselves. In a large well-lighted shop we find lenses in various stages of completion and finish. We are first shown the rough glass in slabs, which is supplied, alike to almost all lens makers, by Messrs. Chance, of Birmingham. These slabs are cut with a diamond and roughed up. They then go through the hands of experienced workmen,

FIG. 5.

FIG. 6

getting nearer perfect in each stage, until at last they reach the hands of the examiner, who puts them through the most searching tests for astigmatism, spherical aberration, etc., and, upon his passing the lenses, they are finished and mounted. Every flint and crown is made to the truest gauge, and of standard size throughout. All lenses are made to standard gauges, which are all of steel. The gauge for each part is handed to the workman and his work is accurately examined and tested by the master

gauge or tools, so that it is quite impossible for imperfect work to get on the market.

Throughout the works the most perfect order and system

FIG. 7.

obtains. The stock, rough metal, finished metal, glass, finished lenses, and mounted goods ready for sale are all registered, so that at any moment the firm know what stock they have and what work the men have in hand. About seventy hands are now employed, and when we remember how young the firm is, we cannot help congratulating them upon the energy they have displayed, and the success their efforts have achieved. Mr. T. Smithies Taylor is the optician, Mr. W. Taylor, the engineer or works manager, and Mr. H. Hobson the business man. All three gentlemen are striving to do their utmost to advance photography by putting on the market the very best lens they can make.

We believe that they will gladly show their works to visitors interested in photography, and those who do visit the Slate Street works will come away, as we did, fully satisfied of having learnt much from the information and explanations so courteously given us.

**Royal Meteorological Society.**—At the usual monthly meeting of this society, held on the 18th inst., at the Institution of Civil Engineers, a very able paper was read by Mr. A. W. Clayden, M.A., on the subject of "Meteorological Photography." Transparencies of photographs of lightning-flashes, clouds, and other phenomena added to the interest of Mr. Clayden's remarks.

Preceding this paper, Mr. G. J. Symons, F.R.S., discoursed pleasantly on the history of rain gauges, the first of which, it appears, we owe to Sir Christopher Wren.

Dr. C. T. Williams, Vice-President, presided over the meeting which was well attended.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.

2. Write each Query or Answer on a separate sheet of paper.

3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editor does not undertake to answer questions by post.

6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4583. **Norway.**—Is May too early to go here? What weather might I expect in that month? Should think of going to Stavanger, proceeding by land to Bergen, and returning by boat from there, or *vice versa*, spending a fortnight. Is it expensive? Would route indicated be good one from photographic point of view? Any hints would oblige.—**PHOTOS.**

4584. **Silver Stained Negative.**—Will some one be good enough to tell me how to remedy a silver stained negative? I attempted to print with it before quite dry; consequently, when I took the print off, the plate presented a series of red wavy lines which completely spoiled any future printing.—**FLETCHER HILL.**

4585. **Lens.**—Will any practical reader give his reasons why a rapid rectilinear is to be preferred to

first-class quality. Always pleased to help you. The greens in platinum toning are generally the result of under-printing.

BARTON.—We can trace no letter from you.

W. W. H.—Print to hand; we will tone and return you next week.

DEVELOPID.—The paper used was Jacoby's.

A. ORR.—We cannot help. Write to the Secretary; he will give you every information.

J. A.—Lecture Hall, Broadway, Hammersmith.

E. PATISON.—Not at present.

T. A. O. (Persia).—The first two numbers of the *Photographic Societies' Reporter* are out of print.

H. A. HALLIWELL.—Congratulate you and Mr. Firth upon having successfully formed a society for Wakefield.

WALTER W. RITCHIE.—Afraid we cannot spare time for further comment upon your print.

H. C. R. HARLAND (Cadapah).—By this mail we have written to you with short criticism on your prints and answers to your questions generally.

SACUL.—Reply sent by post.

W. G. BLACKIE.—Very many thanks.

P. R. AMBLER.—Thank you very much for the letter, re "Annual." The three prints show much care in selection, are slightly over printed, but are very fair samples of photography.

G. F. DIETRICH (Germany).—Will do our best to get the particulars.

J. H. RIDDETTE.—We much appreciated your note.

SNAP SHOT.—No name or address, therefore cannot publish your letter.

R. W. COPEMAN.—We insert the paragraph. Should have been pleased if you had entered the competition.

CARLSBAD.—See our rule. Will answer about stereo next week.

J. E. THORBURN.—We really cannot answer your questions. The camera was only in our hands for about five minutes, and we have sent your letter on to the makers, who will, no doubt, write you.

SOUTHPORT.—We do not advise upon apparatus; see rule at head of column. Any of the exposure books will be found useful. (3) Yes, for further information on toning see the "Amateur Photographer's Annual."

GRAMMAR, R. FIEST, AND INTERNATIONAL.—Will reply next week.

B. THORNTON (Petersburg).—Many thanks for letters. Shall be glad of further particulars.

VEXATIO.—Your letter shall be laid before those interested in the matter.

## Quarterly Examinations in Photography.

### QUESTIONS.

1. Describe in detail the process for stripping the film from a negative.
2. What do you consider the best method of packing plates or negatives for transmission by post?
3. Describe the production of a Woodbury-type print.

(Latest Day for Answers—April 6th.)

NOTE.—The above questions conclude the first quarterly examination. Intending competitors for the next quarter are desired to apply at once for registration. See also "Our Views," page 222.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the *AMATEUR PHOTOGRAPHER* will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the *AMATEUR PHOTOGRAPHER*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent, the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc. — *AMATEUR PHOTOGRAPHER*, January, 1888, to December, 1890, clean; accept best offer.—Hardcastle, Clifton Green, York.

*AMATEUR PHOTOGRAPHER*, vols. ix. to xiii. inclusive, all in reading cases; 12s. 6d. — No. 132, *AMATEUR PHOTOGRAPHER* office, 1, Creed Lane, London, E.C.

*AMATEUR PHOTOGRAPHER*, 40 numbers, 3s.; "Photography," 40 numbers, 1s. 6d.; mostly consecutive. —27, Albert Road, Peckham.

**Bicycle.** — Cushion tyre safety, diamond frame, ball bearings, ball pedals, first-rate machine, new this year, good make, easy runner, and good hill climber; £7 15s.; good bargain; approval with pleasure.—*Amateur*, 34, Hill Street, Ipswich.

**Burnisher.**—Quarter-plate burnisher, new, only been used few times, with spirit lamp; cost 7s. 6d.; cash 4s. 6d.—Fred Howden, Birstall, near Leeds.

Burnisher, on polished wood stand, 14 in. steel bar, steel roller, and steel pressure spring, fly wheel and pinion driving motion, new condition; price £3; worth double.—W. Crouchley, Lingard Street, Bedford Leigh.

**Cameras, etc.**—Lancaster's Instantograph, half-plate, complete; 35s. — Penrose, 15, Oak Street, Holgate, York.

Whole-plate camera, complete; cost £12 12s. new; cash £8; exchange for quarter-plate and cash. — 6, Vale View, Grosvenor, Bath.

Half-plate Lancaster's extra-special 1890 camera, with three double backs, scarcely used; £4 5s. — Pain, Kingswood, East Sheen.

Superb half-plate camera, brass-bound, double extension, three double slides, brass turntable, 3-fold sliding tripod, all most exquisitely finished, new this month; cost 11 guineas; sacrifice £8 15s.; photograph, with particulars, one stamp. — 61, Gayhurst Road, Hackney.

**Cameras, Lenses, etc.** — Whole-plate camera, Stereoscopic Co.'s very best light pattern, every movement, three double backs, Optimus 9 by 7 R.K. and W.A. lenses, focussing cloth, solid leather case, and tripod, all equal new; cost £27 15s.; price £17; approval; deposit.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Quarter-plate sliding box camera, with lens (by Millelt); bargain, 15s. cash, or exchange anything useful to value; 20s. — Chamberlain, Wantage, Berks.

Lancaster's quarter-plate Meritole camera, complete with lens, tripod, and two double backs, in thoroughly good condition, cost 37s., price 22s. 6d.; also *AMATEUR PHOTOGRAPHER*, vols. vii. and viii., extra-strongly bound, 7s. 6d.; vol. ix., unbound, 2s. 6d. — R. T. Rossiter, Palace Avenue, Paignton, Devon.

7½ by 5 square reversing double extension Spanish mahogany camera, three patent dark-slides, two cases; £7 7s.; or, with lens, stand, shutter, etc., £10 10s.—Photo, 173, Hemingford Road, N.

Quarter-plate mahogany box camera, with slide and excellent doublet portrait lens complete, price £1; also half-plate bellows camera and double dark-slide, no lens, price £1; also new half-plate burnisher and lamp, complete, price 9s. — A. Tyler, Creek Road, March.

Whole-plate bellows camera, will extend 2 ft. for copying, square reversible swing-back, three double slides, with half and quarter-plate holders, lens, stops, cap, pneumatic shutter, Kennet stand, printing frame, two celluloid dishes, all cost new; the lot £10 — L. O., 12, Couthouse Road, London, N.W.

**Hand-Cameras, etc.** — Hand-camera, Rouch's Eureka, cost £7 12s. 6d., covered morocco leather, nearly new; £5. — W. M. Miller, 9, Braydon Road, Upper Clapton, London.

Fallowfield's Facile, mahogany body, takes 12 quarter-plates, good as new; £3; or exchange to value. — C. Wood, 106, Lower Edwardes Street, Birmingham.

No. 1 Kodak, almost new, in leather case; price 50s.; cost £5.—S., 4, Seville Street, Lowndes Square.

Hand-camera, Samuel's quarter patent, new, 42s.; rectilinear lens, 7 by 5, hood, stops, working f/8, 25s.; canvas camera case, strong, good straps, leather-fitted, 9s.; approval. — 1, Hermitage Mews, Stamford Hill, N.

Swinden and Earp's hand-camera, perfect condition, new last month; approval; deposit; £6.—H. C., 54, Cheestergate, Stockport.

Talmer hand-camera, almost new, holds twelve quarter-plates; cash 35s.—Colebank, 8, Strand, Torquay.

Turnbull's quarter-plate hand-camera, 3 double backs, R.F. lens, adjustable focus, nearly new, £3 10s.; Hawkeye hand-camera, three double backs for 5 by 4 plates, fitted rapid view lens, adjustable focus, cost £6, sell £2; good condition. — Collins, Chalfont, Bucks.

**Lenses, etc.**—For sale, a pair of Harrison's Globe W.A. lenses, 3 in. focus, cost £4 16s., price £2 10s.; Levi's portrait lens, 15s.; Lerebours and Secretan's quarter-plate portrait lens, 15s.; quarter-plate portrait lens, 10s.—F. R. Upcott, 135, Brigstock Road, Thornton Heath. (Can be seen at the offices of the *AMATEUR PHOTOGRAPHER*.)

Half-plate rapid rectilinear f/8 lens, Waterhouse stops, good condition; 21s.—H. Rowe, Wallbridge, Stroud.

Portrait lens, quarter-plate, in good condition, recently rendered thoroughly achromatic by Franks, of Manchester, very cheap; 20s.—R. M. Jones, 93, Tweedale Street, Rochdale.

Burr's carte portrait lens for sale, price 25s.; cabinet portrait lens, 17s. 6d.—J. Chalmers, 61, Campbell Street, Hamilton.

Ross' No. 8 portable symmetrical, £8 10s.; Ross' 10, by 8 rapid symmetrical, optical centre marked, £7; both as new.—D. Smith, 14, Frogat, Hampstead.

Ross' R.S. lens, 8 by 5, little used; £4 10s.—Robt. Morrison, 21, Clare Street, Dublin.

Half-plate instantaneous lens, with pneumatic time and instantaneous shutter; 21s. — Jones, Gazette Office, Malton.

Quarter-plate rapid rectilinear lens, good condition, Waterhouse stops, in case; 21s.—Martin, Dean-gate, Auckland Road, Upper Norwood.

**Roll-Holder.** — Thornton's 12 by 10 roll-holder, Tourist pattern, has ball indicator, and registers number of exposure; for £5 15s. 6d., or offers.—Address, Editor, *AMATEUR PHOTOGRAPHER*.

**Roller Press.** — Will exchange 18 in. by 12 in. roller press, iron bed, double pressure, steel plate, nickelled, and top roller nickelled, for whole-plate rapid rectilinear, by good maker; photograph sent. — Spink, Herne Bay, Kent.

**Sets.**—Lancaster's International set, comprising half-plate camera, lens, tripod, two dark-slides; £4; little used.—McGibbon, Chemist, Edinburgh.

Lancaster's half-plate Meritole set, complete, with two double backs; price 35s.—Address, B. A. Smith, Spring Villa, Putney Road, Handsworth, Birmingham.

**Shutters.**—One Newman's half-plate instantaneous shutter; £1. — Apply, A. B. Larkins, 49, Ebleham Road, Kensington, W.

Optimus Plunge shutter, for 10 by 8 lens, cost 48s., good condition, £1; Optimus Right-about Turn, for whole-plate lens, cost 35s., good condition, 15s.; Optimus quarter-plate Economic, 6s.—Collins, Chalfont, Bucks.

Newman shutter, half-plate, in excellent condition; what offers? — S. B. Haw, Greenheys Road, Liverpool.

**Sundries.**—Splendid collection of over 700 stamps (Oppen's album) for sale, or exchange for Lancaster's Omnigraph hand-camera, must be in splendid condition.—Bennett, New Walk, Beverley, Yorks.

Walking stick stand, splendid stick; price 6s. 6d. — No. 131, *AMATEUR PHOTOGRAPHER* office, 1, Creed Lane, London, E.C.

Three dozen plates, 7½ by 4½, strong plate box, 50 grooves; 10s. 6d. lot.—Jones, Gazette Office, Malton.

**Tricycle.** — Tricycle (Brooks' patent) for sale or exchange, cost £22 about eight months ago, ball bearings throughout, two saddies, one Brook's patent lamp, in perfect condition, equal to new; none need apply only those that want a really good machine; will exchange for good whole-plate camera, three double dark-slides, and lens, must be thoroughly good, or offers. May be seen any time by appointment.—Lovell, Bridge Street, Godalming.

**Views.** — Peak of Teneriffe, Great Olders of Palma, views.—Soar, 1, Sussex Villas, Kensington, London, W.

### WANTED.

**Burnisher.**—Burnisher, half-plate, cheap, in good condition; mention makes and particulars.—James Martin, 22, Kidbrook Grove, Blackheath, London.

**Camera, etc.** — Quarter-plate or 5 by 4 camera, with slides, etc., Bare's make, Kinnear's make; write.—O. Nowell-Usticke, 108, King Henry's Road, South Hampstead, N.W.

**Cameras, Lenses, etc.** — Quarter plate camera, lens, and tripod, cheap for cash.—F. Howden, Birstall, near Leeds.

Half International or Instantograph, '90 or '91 pattern camera, lens, etc., must be good and cheap; approval cash.—Holman, Penarth, Cardiff.

**Coudenser,** for enlarging, 6 in., must be cheap.—Ferguson, Post Office, Kirkcaldy.

**Lenses, etc.**—6 by 5 rapid rectilinear, Dallmeyer or Ross, lens. — W. Grimshaw, Bold Street, Liverpool.

**Shutter, etc.** — Thornton-Pickard time and instantaneous shutter, to fit 2½ in. hood; also last volume "Photographic Reporter," unbound, cheap for cash. — J. Halliwell, New Veterinary College, Edinburgh.

[PRICE TWOPENCE.]

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.

OUR VIEWS.—Lantern Slide Competition—Free Portraits, Action for Damages—Photography in Cape Colony—Popularity of the AMATEUR PHOTOGRAPHER Competitions—Photographic Exhibition at Gloucester—The Camera Club Conference, Programme—London Stereoscopic Company, Ltd., Annual Meeting—The Newcastle Photographic Association—The Liverpool Photographic Exhibition—Caelmsford Camera Club—Exhibition at St. Petersburg—The "Griffin" Hand-Camera, Dine's Patent.

LEADER.—Home Portraiture.

LETTERS TO THE EDITOR.—A Plea for Young Amateurs; A Reply (C. R. Wright)—Photographic Survey of Exeter (John Sparshatt)—Postal Photographic Club (T. T. S. Metcalfe)—Exposure v. Development (Hurter and Driffield, R. C. Macleod)—Hydroquinone Development (Stanley C. Bright)—Liverpool Exhibition; a Protest (T. S. Mayne)—Liverpool Exhibition; Standard of Work (T. S. Mayne)—Photography in Natural Colours (A. A. Mantell, Faibenlehre)—The Storm in the Naturalistic Crater (P. H. Emerson)—Construction of Lenses (C. J. Leaper)—Federation of Societies (F. W. Edwards).

COMMUNICATED ARTICLES.—Construction and Use of Photographic Lenses, Illustrated (Leaper)—Chemistry for Photographers (Bothamley)—Photo-Micrography (Pringle)—Photographic References (Nott).

EXHIBITIONS.—Liverpool.

NOTES.—Paris.

NOTICES, ETC.—Meeting of the London Stereoscopic Company—New Premises of Messrs. Adams and Co.—Where to Go—Round about the Clubs; Croydon.

SOCIETIES' MEETINGS.—Ash'ton—Blackburn—Dukinfield—Ealing—Graphic—Great Yarmouth—Huddersfield—Ipswich—Ireland—Newcastle-on-Tyne—North Middlesex—Oxford—Putney—Sheffield Camera Club—Wolverhampton.

A VERY considerable number of ladies and gentlemen were present at our offices when the lantern slides contributed to the third Monthly Competition, "Animals and Instantaneous Pictures," were passed through the lantern. The prizes have been awarded as follows:—

*First Prize (Silver Medal).*

THOS. B. SUTTON .. .. . Liverpool.

These slides are on Mawson's plates developed with hydroquinone. "A Quiet Corner" is a well-lighted picture of cattle in a brook. "Jumbo" is an excellent portrait of a fox terrier.

*Second Prize (Bronze Medal).*

Major A. P. G. DOWDALL .. .. . Exeter.

This competitor's slides are both instantaneous studies of the "Flying Dutchman"—"Getting up Steam," and "Shutting off Steam." The original negatives were taken in a hand-camera. The slides are admirable examples of excellent work on Thomas's plates, by contact, developed with hydroquinone.

*Third Prize (Certificate).*

S. L. COULTHURST .. .. . Manchester.

The slides sent by this competitor are on Mawson's plates,

made by contact and developed with hydroquinone (Thomas's formula). The subjects are agricultural—"Reaping" and "Cattle at Moston." Only some thirty competitors sent in to the competition. The slides as a whole are of very fair average quality, only three competitors being classed with the third class. The full list is published in the *Photographic Reporter* for this month.

WELSHMEN are well able to take care of themselves in all business matters. Recently a free portrait company entered into negotiations with Police Sergeant Owen for the usual "two guinea portrait free of charge," and had the regulation correspondence about the frame, etc. The sergeant waited forty-eight days, and then received back his original photograph in a torn and damaged state, and at once sued the company in the county court for breach of contract, £2 2s., and damage to photograph, 6s. The day before the case was set down for hearing the company paid the full amount and costs into court. A local newspaper says—"People at Bettws-y-coed are now on the look-out for similar advertisements, as they can see their way to making a couple of guineas easily by replying to the advertisement, and in the event of failure to fulfil, to sue for damages, with every prospect of getting them, and with no risk of loss."

In proof of the popularity of our loaning of photographs and lantern slides, we have received the following application from King William's Town, Cape Colony:—"As our winter season is just opposite to yours, it has occurred to me that you might be able to send us a set of the AMATEUR PHOTOGRAPHER lantern slides and competition prints. These would be specially useful to us from an educational point of view; we are all amateurs, and have started work since our arrival in the colony. None of us have been in England for eight years or more, and have not the advantages of our amateur brethren in England of seeing the work at various exhibitions."

We have arranged to send out both slides and prints by an early mail.

WE understand that the Exhibition to be held at Gloucester from the 20th to the 30th promises to be a great success. Already more than one hundred entries have been received. During the Exhibition, lantern shows will be given in the evenings. On Thursday, the 23rd inst., Mr. Charles W. Hastings will show the 1890 AMATEUR PHOTOGRAPHER Prize Slides.

THE Camera Club Conference, as already announced, will be held next week. The following is the programme, as issued by the Committee:—

Tuesday, April 7th.—Conference at the Society of Arts, 18, John Street, Adelphi, to be opened by the President at 2 p.m. Papers to be read from 2 p.m. to 5.30 p.m. in the theatre:—Captain W. de W. Abney, R.E., C.B., D.C.L., F.R.S., Presidential Address; Mr. Lyonel Clark, C.E., "The Use of Uncorrected Lenses;" Mr. Joseph Pennell, "Photography as a Hindrance and a Help to Art;" Rev. F. C. Lambert, M.A., "Note on the Physiological Aspect of Some Problems in Art." At 8 p.m., exhibition of lantern slides in the theatre.

Wednesday, April 8th, 2 p.m.—Renewal of Conference in the theatre, Society of Arts. Papers to be read from 2 p.m. to 5.30 p.m.:—Major J. F. Nott, "Photography and Illustrated Journalism;" Mr. C. V. Boys, "An Application of Photography;" and a paper by Sir H. Trueman Wood. At 7.30 p.m. the members and friends will dine together at the Criterion Restaurant.

The annual exhibition of photographs by members will be on view at the club-house from 10 a.m. to 4 p.m. Admission by card from any member of the Club, or by ticket from the Hon. Sec. The exhibition will remain open for about six weeks from Tuesday, April 7th.

We have pleasure in calling special attention to the Committee's invitation to all photographers to attend the Conference.

To the country members, the new club-house will certainly offer an additional attraction for the Conference week, and we are sure that they will cordially congratulate the Committee on the work they have done. We might perhaps mention that on Monday, the 6th, there will be a musical evening at the Club, which is sure to be well worth attending.

THE annual general meeting of the shareholders of the London Stereoscopic Company, Limited, was held last week, when a dividend at the rate of 5 per cent. was declared, £1,000 added to the reserve fund, and a balance carried forward of £328. The Chairman, Mr. Howard J. Kennard, spoke in very satisfactory terms of the business done and the advances made in every branch of the Company's business. He referred to the great increase of work done in the photo-mechanical department, and said that, acting upon the advice of their Manager, they had added another storey to their buildings, and had largely increased the plant. We were at the Regent Street premises a few days ago, and found the Managers of the different departments full of work, and the show-rooms full of customers. It has been very truly said that the Stereoscopic Company were the pioneers of photography for amateurs, and they still enjoy the support and patronage of the leading amateurs at home and abroad.

THE Newcastle Photographic Association have had a very successful year. The members now number 120, and a very considerable number are active workers. The exhibition held during the past year was a great success. The Association's finances are in a very satisfactory state. In moving the adoption of the report, the President, Mr. A. S. Stevenson, paid a high compliment to the services of the Hon. Sec., Mr. Edgar G. Lee, who, in conjunction with Mr. Brown, did so much and worked so untiringly to make the exhibition a success. Mr. Lee has already won many laurels, especially for lantern-slides; the care that he takes in selection of point of view and technique has earned for him the reputation of being a most painstaking worker.

We gladly publish the letter from Mr. Thos. Mayne, in which he comments upon the remarks we made last week

on the Liverpool Exhibition; we do not think that we spoke in the least disparagingly of the exhibition as a whole, and he explains in some measure the possible reason why "prominent workers abstained from sending in pictures." We regret their absence, and are sorry to notice that so many whose pictures we are accustomed to see at Pall Mall did not respond to the invitation of the Committee, and so have helped them to make the exhibition even a greater success than it has been. We are asked to notice that the exhibition remains open until Saturday in this week, and that upon every night two lantern demonstrations and on every afternoon and evening a promenade concert are given. Further particulars will be found in another column.

ANOTHER photographic society has been formed—the Chelmsford Camera Club. Already a considerable number of members have been enrolled. The Hon. Secretary, Mr. Alfred J. Jeffries, Bridge House, Chelmsford, a gentleman whose photographic work is of a very high standard, will be glad to send a copy of rules, etc., to anyone who may desire to join the club.

THE Photographic Exhibition at St. Petersburg will be open from the 17th to the 29th of this month. We shall probably give a short account of the pictures exhibited.

At the Photographic Society's meeting, a few nights since, several hand-cameras were exhibited. One which excited considerable attention was the "Griffin" improved hand or detective camera, Dine's patent. It is hardly ready for the market, but as it has several special features, we would briefly call attention to the main points: (1) a light grooved box or magazine, which can be placed in the camera without taking it into a dark room, and can be recharged in daylight; (2) each plate can be exposed at the will of the operator; (3) any number of light-tight boxes holding twelve plates may be taken when on tour. The camera will be put upon the market very shortly by Messrs. John J. Griffin and Co., of Garrick Street, W.C., and we shall refer more fully to it in a subsequent issue. Messrs. Griffin have kindly consented to send one to our offices for exhibition purposes.

#### HOME PORTRAITURE.

ONE of the most important of all accessories for home portraiture is the background; nothing is so painful as to see a fine head spoilt by some not always artistic wall paper, which is generally so sharply focussed, that one may count every petal on some impossible flower, or see joins and irregularities in the said paper. If we want to turn out artistic work, wall papers must be avoided as a rule; rarely do the patterns lend themselves for use as backgrounds, and even when they do, they should be thrown out of focus so as to become mere suggestions rather than concrete shapes.

There are, of course, portable backgrounds to be obtained commercially, of perfect quality, and at such a price as to bring them within the reach of all—a glance at our advertisement pages will at once give the requisite information as to sizes and prices, etc. But many of us have a great hankering after home-made contrivances, and the few hints we may give may be of service to those handy with carpenter's tools.

The first background we ever used was the so-called felt paper, or wide brown paper as used under carpets; this may be obtained from almost any house furnishers, about six feet wide and any length. Having obtained the paper, the next question is how to mount it. For this purpose procure

an ordinary blind roller of the requisite length, and fold down six inches of the paper at one end, and having some thin glue ready, coat the turned down portion of the paper with the glue, place the roller under the fold and dab quickly into contact with a cloth. It is obvious that we mean the underneath side of the turned down strip is to be glued, the turning down being merely a device to obtain the paper straight on the roller, otherwise we may get some nasty bulges in the background. When the glue is dry, a sufficient length of the paper may be cut off, and a lath glued into it in the same way as the roller. About eight feet will be found a convenient length, and we have thus a background six feet by eight feet of one uniform tint. This will serve its purpose well, and may be rolled up and stowed away in some convenient corner when done with.

A more durable background may be made of the material used for blinds, and with this we can obtain two or three backgrounds without much expense. Thus we may choose a pale buff which will give us a pale tint suitable for dark people, and by choosing also a deep green or deep red, we can obtain a dark background for fair hair, white or light dresses, and children. There are one or two points in connection with the background which it will be as well to mention before proceeding any further. The first is, when mounting cloth backgrounds it is advisable to nail them to the roller, exactly like a blind, and an important point in this, as in the paper backgrounds, is to get them to hang straight; this can best be done by commencing to nail in the centre, working out to the edges and giving the cloth at each nail a gentle stretch, we then get no bulges or wrinkles. The second point refers to the choice of colour. It is well known that the illumination in most rooms is poor, and it is also a well-recognized fact "that coloured surfaces undergo changes of tint when they are seen under a very bright or very feeble illumination," hence it is advisable to choose rather a lighter tint of any colour than we actually desire, as in the poorly-lit room the tint will actually appear darker than it really is.

The next question to consider is how to support the background, and this requires practically a frame, or stand, which can be easily made from deal by a carpenter, or even by the amateur himself. The frame should take the form of an inverted V, thus  $\Delta$ , and one of these at each end will be quite sufficient to support any background it may be desirable to use. Personally we use two iron rods which were originally used as curtain suspenders we fancy; these are bound together near one end so as to leave two little cross-pieces, about six inches in length, which crossing over form a fork in which the ends of the roller rest, these at each end serve to support the background. The lower ends of the iron rods are inserted in holes bored in pieces of deal six inches square and two inches thick; this prevents the rods slipping, and enables one to shift the background about as one likes.

—♦♦♦♦♦—  
**"Photography in a Nutshell."**—Mr. William Tylar, of High St., Aston, Birmingham, has sent us the last edition of this admirable little manual bound in cloth and interleaved for notes. The arrangement of the matter which treats of photographic manipulation and procedure, is on novel lines, and will be found serviceable to both the beginner and advanced worker. The copy before us has a complete catalogue of Mr. Tylar's many excellent specialities. We understand that Mr. Tylar is in treaty for the publication of his manual in French and German. Mr. Tylar has also sent us a useful packet of "light-tight bags" for packing exposed plates. In these bags two plates are placed face to face with a layer of chemically pure vegetable fibre between the films, and then enclosed in a yellow or non-actinic envelope, and still further protected by enclosure in a strong black envelope. This packing ensures perfect freedom from risk of fogging. The envelopes are very strong, very cheap, and, like all Mr. Tylar's "dodges," very useful.

## Letters to the Editor.

### A PLEA FOR YOUNG AMATEURS—A REPLY.

SIR,—I was very much surprised at the tone of "A. C. C.'s" letter of last week. He casts a grave reflection on photographic societies in general, societies whose chief aim should be to help the beginner, both by practical tuition and social intercourse. I think he is inclined to take the matter from too personal a view and airs a grievance by which he perhaps is the only sufferer.

There is always one person to be met with in nearly every society—that is Mr. "Bore." He takes the form of an individual who is for ever poking prints and negatives under everyone's nose, and generally descanting on the merits and demerits of this, that, and everything else. Such an individual is inclined to be sat on, and deservedly.

Speaking from my experience in connection with our society at East Southsea, I may say that one of its leading features is the cordiality with which a beginner is welcomed and the practical help that our more advanced members are only too pleased to extend.

By the efforts of a hard-working committee, supported by an increasing membership, our Society hopes to afford to its more inexperienced members that practical and social assistance which shall do away with all possibility of any local advertisements of "camera for sale" taking place under the conditions enumerated by your correspondent.—Faithfully yours,

March 22nd, 1891.

CHAS. R. WRIGHT.

\* \* \* \*

### PHOTOGRAPHIC SURVEY OF DEVON.

SIR,—Last year the Exeter Am. Phot. Soc. started on a photographic survey of Devon, which should prove very interesting and even valuable.

We are endeavouring to secure the co-operation of all the photographic societies in the county, so that the work may be divided, and more thoroughly accomplished than would be possible by one society alone. We venture to appeal, through your columns, to those photographers who have any negatives of places of interest, for prints from the same, in some permanent process, or for the loan of such negatives for a short period. I need not say that every possible care would be taken of them.—Yours, etc.,

JNO. SPARSHATT  
(Hon. Sec.)

Fairfield House, St. Thomas, Exeter,  
 March 24th, 1891.

\* \* \* \*

### POSTAL PHOTOGRAPHIC CLUB.

SIR,—Will you kindly allow me to reply through the AMATEUR PHOTOGRAPHER to the very numerous letters I have received re my Postal Photographic Club. I beg to say that I sent my letter and the copy of the rules, which appeared in the AMATEUR PHOTOGRAPHER of the 20th, only as a help to anyone wishing to start a similar club, and not as an advertisement of the P.P.C.C.; our members' list is quite full, and we have no vacancies. Thanking you in anticipation for inserting this, I am faithfully yours,

March 25th, 1891.

T. T. S. METCALFE.

\* \* \* \*

### EXPOSURE V. DEVELOPMENT.

SIR,—We read with interest the letter of "E. A. D." in the last issue of your journal, as he appears to be a beginner whose progress is impeded by erroneous teaching on the subject of development. We are sure that nothing can be so disheartening to the tyro as to be constantly informed on all sides by great authorities that he has it in his power to correct errors in his exposures by suitable modifications in development; and yet, when he comes to test this statement in practice, to find, like "E. A. D.," that he, at any rate, cannot do anything of the sort. No wonder the beginner, as a rule, keeps his failure to himself, lest he should be credited with incompetence and stupidity. We are, therefore, pleased that "E. A. D." has come forward, and we are convinced that the conviction now dawning upon him would be echoed by hundreds of others, did they not fear that to give expression to their opinions would be to admit their own incapacity.

If, however, "E. A. D." and others whom it may concern, care to take our advice, which we firmly believe will lead them to the goal, it is as follows: Stick firmly to your own presentiment that "an under-exposed plate remains an under-exposed plate, and an

over-exposed plate an over-exposed one." It is the light which settles this, and not the developer; in spite of all opinions to the contrary, therefore, make exposure the object of your greatest care. Apart from the art aspect of the question, it is the exposure which makes or mars the negative. Use the best plates you can procure, and by the best plates we mean those richest in silver. Upon this depends their capacity for the truthful rendering of tone, and also the amount of latitude in exposure. Adopt ferrous oxalate as your developer, for it will yield negatives which are not to be surpassed; and should occasional results indicate error in exposure, rest assured that nothing you could have done in development, or can do subsequently, will remedy a false relationship in the gradations established by the light alone.—Yours truly, F. HURTER AND V. C. DRIFFIELD.

Appleton, Widnes, March 28th, 1891.

SIR,—I have, like "E. A. D.," been carrying out a series of experiments with hydroquinone for negatives, bromide paper, and lantern slides. If you think my experience of any use, you may, perhaps, be willing to afford me some space. For copying prints, or work of that kind, I think quinol beats any other developer, but for that very reason, that it gives very strong contrasts, it is most unsuitable to landscape work. I personally prefer good work to clean fingers, and never mean to use quinol for any save copying work. I believe, too, that pyro is mainly very dirty because so much of the water we use has iron in it. Use distilled water, and your fingers will not get so dirty.

With bromide paper I find quinol will yield prints indistinguishable from platinotype if you have a perfectly suitable negative, but it very often gives a nasty greenish colour, and in my hands, at all events, with anything at all approaching a hard negative, it yields terrible results, while by reducing iron in the ferrous oxalate a great deal may be done. I have, therefore, decided to give up quinol for bromide paper.

For lantern slides, however, I find quinol unrivalled. I use ammonia as the alkali, as the other alkalis are all apt to give a green tone. For some, to me, hidden reason, ammonia seems to be a far less powerful accelerator with quinol than with pyro, and exposure has to be prolonged and the ammonia added in considerable quantities; I find a large quantity of bromide is also desirable. The following is about the ordinary developer I use, giving a long exposure:—

Quinol .. .. .	4 gr.
Bromide potassium .. .. .	1 to 2 "
Ammonia .. .. .	4 "

—Yours faithfully,  
March 30th, 1891. R. C. MACLEOD.

\* \* \* \*

#### HYDROQUINONE DEVELOPMENT.

SIR,—I notice in your issue for March 27th, just received, a letter touching upon hydroquinone development. May I crave a small corner of your valuable space for reply?

Like your correspondent, I have not been long at photography, and have met with the same difficulties that he mentions. I began with pyro, but as my profession during the day demanded clean hands, the above developer was soon put on the shelf and replaced by hydro.

After many failures, I found that even with normal exposures (Ilford plates and formula) I always got better results by mixing, in the proportion of 2 of hydro to 1 of accelerator, instead of equal parts, adding the rest of the accelerator when minute details in the shadows were just making their appearance, and when these were well up, adding two or three drops of 10 per cent. bromide. This way I got splendid negatives with every gradation of tone.

In the case of under-exposure I find it best to soak first in the accelerator, and then add the hydro, and in cases of known much over-exposure, I place in hydro alone, with three or four drops of 10 per cent. bromide, and cautiously add the accelerator drop by drop and more bromide if necessary, and have saved more than one negative this way. Trusting these remarks may be of use to your correspondent, yours truly,  
Genoa, March 28th, 1891.

STANLEY C. BRIGHT.

\* \* \* \*

#### LIVERPOOL EXHIBITION—A PROTEST.

SIR,—In reply to "An Exhibitor," the errors over Nos. 381 and 383, etc., were merely printer's errors, which have been corrected in second edition of catalogue.

Regarding the awards, the almost universal opinion is general

satisfaction. The judges had full power to withhold or award extra medals.

It really would be difficult to arrange a class where each exhibitor should be allowed to judge his own work.—Yours truly,  
March 24th, 1891. T. S. MAYNE (Hon. Sec.)

\* \* \* \*

#### LIVERPOOL EXHIBITION—STANDARD OF WORK.

SIR,—Will you allow me a word in reply to the remarks on page 223 of your last issue.

You have referred to your close examination of the catalogue as to the conspicuous absence of "our prominent workers." That a few names are not to be found we regret, but I am confident we have on the walls work equal in every respect to any ever shown by any of the absentees.

Another feature in the Liverpool Exhibition is that about 100 champion class pictures of the very highest standard which have ever been medalled at public exhibitions are placed in one class, and, of course, if these pictures were scattered over the rooms in many of the classes these prize pictures might come under more general notice.

Another point is, some of the absentees may not have found it possible to contribute work which they had "never before exhibited," others that the set of "four" was not convenient.

We struck out in 1888 a bold course with respect to work which had been for years round the provinces, the rule we then ventured on is now almost universal.

In this year's exhibition we moved ahead on our own lines and have every reason to be gratified that we have on the walls such splendid results contributed by hitherto unknown names. I will just mention two names, the Countess Loredana and H. Lloyd Edwards, both amateurs, and probably (with one notable example excepted) no work of such universal good merit was shown in 1888.

I will merely conclude with confirming what I said at the opening, "That the Exhibition is a distinct advance on that of 1888. The judges have had a most difficult task, because they had to face such a lot of good work."

This view is over and over again endorsed by the presidents and officials of the leading societies throughout the kingdom, and I believe was the united opinion of the six judges—four at least, I know, said the Liverpool Exhibition was the finest they had ever seen—both in quality, quantity, and excellence of arrangement.—Yours truly,  
March 30th, 1891. T. S. MAYNE.

#### PHOTOGRAPHY IN NATURAL COLOURS.

SIR,—I have met several persons lately who have jumped to the conclusion, from what they have read in the newspapers respecting "photography in natural colours," that the secret has at length been discovered, and that before long they will be able to obtain photographs in all the exquisite colours they see when looking at a landscape or rather picture on the ground-glass of a camera, and it is marvellous how impossible it is to persuade any such that it is a romance, the fact being quite sufficient for them that they have seen it in the *Times*. I am an amateur worker and experimenter of upwards of thirty-six years, and this long experience has told me that this consummation of photography will never happen.

Much absurd literature, chiefly theoretical, has been written, is being written, and will continue to be written on this subject, and I should therefore like to record this as the opinion of "an old Parliamentary hand," that neither the present nor any future generation will see it accomplished. I am aware that this letter may call forth some strong invective from some persons who love controversy for its own sake, but nevertheless I feel sure that, with Captain Abney, I shall be on the winning side.—Yours, etc.,  
A. A. MANTELL, M.D. (Surgeon-Major).

March 28th, 1891.

SIR,—I am pleased to see Mr. Lacy has not retired altogether from the discussion on the above subject. Evidently we have not in common the same mental definition of subjective, but I do not think we need quarrel about that; even if, as he states, the subjectivity of a phenomenon has no existence outside the object, it cannot be impossible to so arrange noumena as to present precisely the same subjective phenomena, as pointed out in your issue of March 13th, page 183, by F. W. Stow; therefore why can

we not so arrange our deposits of silver to give rise to colour? Mr. Lacy admits "that colours can be produced by various mechanical means," yet he refuses to admit that we may make use of photography and a silver image as one of the "various mechanical means." If Mr. Lacy is right, then it is impossible to produce colour by enclosing a thin film of air between any two glass surfaces or by a thin film of oil on the surface of water, or by a soap bubble, but these things actually are, that is to say, we can, with certain curvature lenses, so arrange them as to give definite thicknesses of air films and definite colours, which can be produced *ad libitum* under precisely similar circumstances.

I am sorry I asked Mr. Lacy about the bull, and it might almost have proved the proverbial red herring, and could still lead us into a Darwinistic discussion. I may be descended from a primordial article or protoplasmic slime, just the same as an oak or an elm, or any of the animals which had such a natural antipathy to Mr. Lacy, but that has nothing to do with the subject in question.

If, as Mr. Lacy says, he does "not feel myself at the present time competent to discuss" the phenomena of light, why did he question an objective fact and declare it an impossibility? That your readers must in part agree with your correspondent from his last letter is an absolute necessity when he states that "there are in nature hundreds of colours that are not in the solar spectrum, and cannot be produced by any combination of its colours." To what does your correspondent ascribe these colours? Presumably Mr. Lacy expects an editorial reply to his question about your leader; it is not, therefore, in my province to answer him on this point, and I leave him to your tender mercies. Unfortunately, I cannot refer to Casati's work, so am unable to test the correctness of this author's statement, but would he have us believe that green trees and the magnificent equatorial colouring of birds and flowers are not perceived by these aboriginal savages? What are the bases of such a statement, and who is Casati to be the man to advance it? Might we not just as well affirm that the old artist of Corinth, Kleophantes, who was strictly a monochrome painter, and who is stated to have been the first to use colour as an aid to drawing after the re-discovery as claimed by the Greeks about 800 B.C., might we not as well assume that he, as well as the Greeks, knew of but one colour? The same argument would apply to every early nation under the sun, for to imitate form as we see it is a natural instinct, to colour it the next step, and monochrome soon gives place to polychromy, the latter becoming more and more complex, more and more beautiful, and more naturalistic—true to nature—as civilisation advances.

I am quite certain that there is no colour, whether natural or artificial, which cannot be imitated exactly by the colours of the prismatic spectrum, combined, intensified, altered by differences of degrees of mixture, luminosity, and such like causes. If a gorgeous sunset is not due to the effect of various substances acting in different ways upon the light emitted from the sun, which we can prove to be compound, then to what is it due? Mr. Lacy says colour is only subjective; does he want to set up an objective or another subjective phenomena, as the cause of his sunsets and glows?—Yours truly, FARBENLEHRE.

\* \* \* \*

#### THE STORM IN THE NATURALISTIC CRATER.

SIR,—When I wrote my book I did not write it for my own glorification, but purely and simply with the intention of trying to help the photographic world to give the fullest expression to the very limited art that they practised. I was justified in thinking I might help them by the attention which my own photographs had received in the photographic world. I regretted the loss of several months' work, which the preparation of the book cost me, but the spirit of the reformer was strong in me and it had to find expression. I have since learned that in art matters, all attempts to bring others to think as you do are hurtful rather than useful. However, to return. I distinctly stated what claims I thought I had to originality. I claimed that I had attempted to reduce naturalistic teachings (which I said were as old as ancient Greece) to *scientific first principles*, and to *apply those teachings to photography*. That was my claim. I still claim I can prove as much, but I am not so greedy for a character for originality as those "who break new ground in the land of Constable" (G. Davison).

The study of development and of new scientific discoveries, psychological and physical, determined me to renounce my former views, and to break a conspiracy I have long watched with amuse-

ment—a conspiracy of which I shall one day write the full history if only as a study of character.

Amid all this turmoil arose a whisper that I had got some of my ideas from a certain book, a book devoid of science and scornful of photography. I refer to "Naturalistic Painting." As a mere matter of dates, my first writing on the subject came first; as a matter of incidental proof, I mentioned the receipt of a letter. Busy-bodies have now been round trying to make mischief, but they shall not succeed. Mr. Bate shall see the letter, and its author will explain the matter to me and to Mr. Bate, and the misunderstanding shall be removed. This is no public matter, but one that concerns us three only.

My writings take precedence of those of Mr. Bate by date. The suggestion that Mr. Bate was in any way influenced by me, I have publicly repudiated.

Every day that I live and grow to see art matters more clearly, I deeply regret I was ever in any way identified with naturalism. —Yours, etc., P. H. EMERSON.

\* \* \* \*

#### CONSTRUCTION OF LENSES.

SIR,—I am extremely obliged to Mr. Lewis for his kindly criticisms, and in reply thereto beg to state that the  $h$  in the diagram given on page 130 should be a  $p$ , and was unfortunately mistaken by me for one. As regards the diagram on page 129, the letters  $e f$  refer, of course, to the direction of the rays  $a b, c d$  after refraction. I might have better perhaps omitted the  $f$  altogether, placing the  $e$  at the point where the rays meet on the axis.—Yours, etc., CLEMENT J. LEAPER.

Dublin, March 27th, 1891.

\* \* \* \*

#### FEDERATION OF SOCIETIES.

SIR,—I notice in the report of the meeting *re* the proposed federation scheme, held on March 23rd last, that my name is mentioned as having been elected a member of the Committee. As this was done without my knowledge or consent, and not having been present at any of the meetings, I must protest against this irregular proceeding, and decline to recognise the appointment. Moreover, the greatly increased duties caused by the rapid growth of the South London Photographic Society occupy all my spare time and attention. I do not feel justified in accepting any further responsibilities.

March 28th, 1891.

F. W. EDWARDS.

**North Middlesex.**—The annual dinner was held at Beale's Restaurant on the 21st ult., the President (Mr. G. Humphries, F.S.A.) in the chair. After the usual loyal toasts, the members pledged the President and Vice-Presidents (Messrs. Goodhew and Walker); the Visitors, coupled with the name of Mr. S. H. Baker; Messrs. Pether, Goodhew, and Gill, the designer and reproducers of the Society's certificate form; and the Press. The toasts were duly responded to, and the President presented to Mr. G. R. Martin, the late Secretary, a very handsome microscope, suitable for micro-photography, the gift of the members, and added to it, as a mark of his personal esteem, a high-power objective, to complete the instrument. Mr. Martin, in acknowledging the gift, said the friendly appreciation of his work accorded to him by the members had been ample reward. The President then presented to the following gentlemen the certificates awarded to them by the judges, Messrs. J. Gale and Ralph Robinson, for work shown at the late exhibition:—Silver prints—1st, J. C. S. Mummery; 2nd, W. T. Goodhew. Platinum and Bromide—1st, F. W. Cox; 2nd, W. T. Goodhew. Genre—1st and 2nd, W. T. Goodhew. Portraiture—1st, E. T. Hiscock; 2nd, F. Cherry. Enlargements—1st, C. Beadle; 2nd, W. Taylor. Lantern slides—1st, W. Taylor; 2nd, E. T. Hiscock. The evening was genially passed with music and song.—On the 23rd ult., Mr. H. Smith in the chair, a lantern-slide exhibition was held. A collection of slides lent by Messrs. Mawson and Swan were first passed through the lantern, and were much admired, and a vote of thanks was given to the firm for the pleasure their kindness had afforded. The following members then exhibited their work:—Messrs. Wall, Mummery, Cox, Smith, Chang, Marchant, Ainsley, and Gill. The slides comprised snow scenes, forest glades, woodland nooks and silent pools, mountain glens, pastoral scenes with the cattle knee-deep in the long rush-grass, the quays and bridges of busy seaports, barges with towering sails gliding placidly along the sedgy broads, solemn minster aisles, and the excited throng of the race-course, the bustle of city life alternated with quiet home scenes and sleepy villages. In every series bursts of applause were evoked by the artistic compositions, and the well-arranged masses of light and shade of some carefully arranged picture, rendered complete by the technical excellence of the work.

## The Construction and Use of Photographic Lenses.

By CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

### CHAPTER IV.—(Continued.)

#### TYPICAL PHOTOGRAPHIC LENSES.

*The Globe Lens.*—This consists (fig. 11) of two achromatic converging menisci, having the same radii of curvature, and placed at such a distance from each other that the cemented surfaces form the circumference of a sphere, the diaphragms being placed at the centre. The following are the data employed in the construction of this lens, expressed as ratios of the principal focus of the combination taken as 10,000:—

FIG. 11.

Outer radius of curvature of external crown lens	..	1,412
Inner " " " " " "	..	2,403
Outer " " " internal flint lens	..	2,403
Inner " " " " " "	..	1,620
Diameter of lenses	..	1,875
Thickness of combination at the centre	..	231.5
Distance between outside of lenses, measured along the axis	..	2,824
Indices of refraction { Crown .. 1.53		
{ Flint .. 1.60		
Specific gravities { Crown .. 2.543		
{ Flint .. 3.202		

A lens of this type is quite free from distortion, but can only be employed with apertures varying from  $f/36$  to  $f/72$ , and, besides being slow, gives a flare-spot of considerable extent.

*The Periscopic Lens.*—This consists of two non-achromatic menisci (fig. 12), whose concave surfaces face each other, the stop being between. It includes an angle of 90 deg., and is non-distorting, but its visual and chemical focus do not coincide. If, however, the visual focus be sufficiently lengthened, and the combination stopped down to  $f/60$  or over, the difference becomes negligible. A pair of crown glass menisci of  $1\frac{1}{2}$  in. diameter, and of 2 in. concave and  $1\frac{1}{2}$  in. convex focus, and separated three-quarters of an inch from each other, will form a lens of this type, capable of covering a whole-plate when stopped down to about  $f/60$ .

For larger or smaller sizes, the following data may be made use of, in which the radii, etc., are referred to the focal length of the combination taken as 10,000:—

FIG. 12.

Principal focus of combination	..	10,000
Dispersive power of glass used	..	.0127
Diameter of either lens	..	1250
Radii of curvature	..	{ + 1750
		{ - 2075
Greatest distance between lenses	..	1250
Thickness of lenses	..	125

*Wide-Angle Rectilinear Lens.*—As made by Dallmeyer

this consists (fig. 13) of a pair of cemented flint and crown lenses. The diameter of the front flint and its focal length are both practically one-fifth the focal length of the combination, the radius of curvature of the concave face of the front crown being  $1\frac{1}{2}$  that of the convex face, and the radii of the front and back surfaces of the flint and crown being calculated so as to yield achromatism. The diameter of the back lens is half that of the front one, the radius of curvature of the convex face of the flint lens being  $1\frac{1}{2}$  that of the corresponding face of the front flint. The radius of curvature of the concave face of the crown lens is  $1\frac{1}{2}$  that of its convex face, and the radii of the front and back surfaces of flint and crown are calculated so that this combination shall also be achromatic. The distance separating the nearest surfaces of the two lenses equals one-seventh that of the focal length of the combination, and the stops are placed at a distance between the two lenses inversely proportional to their respective focal lengths.

FIG. 13.

This lens is non-distorting, includes an angle of nearly 100 deg., and gives no flare-spot. It is sent out by Dallmeyer in seven sizes, having foci from  $3\frac{1}{2}$  to 17 in., and capable of covering from  $7\frac{1}{2}$  by 5 to 21 by 25 in.

*The Aplanatic Lens.*—As made by Steinheil, this consists of two symmetrical and separately achromatised combinations (figs. 14, 15, 16), placed at distances apart, and of forms varying according to the use to which the lens is to be put. The cemented lenses are in this case both made of flint instead of flint and crown (contrast fig. 17), in consequence of which astigmatism is reduced to a minimum, and there is, besides an entire absence of distortion.

FIG. 14.

Four series of these lenses are made by Steinheil, of various rapidities, and serving different purposes.

The following are the data for making a lens of this type working at  $f/7$ , including an angle of 60 deg. and of  $9\frac{1}{2}$  in. focus:—

Front or Back Lens.		Index of refraction.
Radii of curvature.	Diverging meniscus of ordinary flint, thickness	{ + 2.472 in. }
	.098 in.	{ - 1.032 " }
	Converging meniscus of heavy flint, thickness	{ + 1.032 " }
	.185 in.	{ - 3.599 " }
Distance between lenses		.. 1.7 in.
Ratio of dispersive powers		.. 1.2436.

As actually made by Steinheil, this series includes eleven

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 187.)

WHEN gently heated with phosphorus pentoxide, nitric acid yields a white solid, *nitrogen pentoxide*,  $N_2O_5$ , which decomposes very easily and combines with water energetically to form nitric acid, thus,  $N_2O_5 + H_2O = 2HNO_3$ . Nitrogen pentoxide is therefore frequently called *nitric anhydride*.

You would observe that in Expts. 113, 114, and 115 the gas evolved by the action of nitric acid upon the metal was not hydrogen, a noteworthy difference between the behaviour of this acid on the one hand, and of sulphuric, hydrochloric, and the rest of the acids on the other hand. This result is due to the oxidising properties of the nitric acid, the hydrogen that would otherwise be liberated being oxidised to water by part of the nitric acid, which is itself reduced to water and some oxide of nitrogen. In some cases the reduction of the nitric acid proceeds still further, and its nitrogen is converted into ammonia.

EXPERIMENT 116.—Into two large test tubes put some pieces of zinc, and add some dilute sulphuric acid; hydrogen will be liberated with effervescence in both tubes. Now to one of the tubes add, drop by drop, some nitric acid previously diluted with 10 or 12 times its volume of water; observe that in this tube the visible evolution of hydrogen ceases,\* whilst in the tube to which no nitric acid has been added it continues. After a time evolution of hydrogen will again begin in the second tube, but can be stopped by the addition of a little more nitric acid. After three or four such additions of nitric acid have been made, pour the liquid in the second tube into a small dish, concentrate by evaporation, add *excess* of caustic soda, and heat; ammonia will be evolved. This ammonia is formed by the reduction of the nitric acid by the *nascent* hydrogen (compare Expt. 52) from the zinc and sulphuric acid, the reaction being  $HNO_3 + 8H = NH_3 + 3H_2O$ . Of course, as fast as the ammonia is formed it combines with the sulphuric acid to form ammonium sulphate.

It is conceivable that by the interaction of nitric acid and nascent hydrogen in different proportions we could get four oxides of nitrogen and free nitrogen itself, as well as ammonia, thus:

As a matter of fact these reactions can be partially realised, the hydrogen being provided either by the action of part of the nitric acid on some metal, or by the action on the metal of some other acid with which the nitric acid is mixed, as in Expt. 116. The extent to which the reduction of the nitric acid proceeds, or, in other words, the particular product obtained, depends clearly on the proportion between the nitric acid and the nascent hydrogen, and this is determined partly by the nature of the metal, and the ease with which it is attacked, and partly by the strength of the acid. The stronger the acid the more limited is the reduction and the higher the proportion of oxygen in the oxide of nitrogen liberated. With one and the same metal, such as zinc, we can obtain different products by using the nitric acid in different states of dilution. If a metal is attacked at all, with the strong acid the chief product is nitrogen peroxide;

\* If too much nitric acid is added, evolution of gas begins again, but the gas liberated is one of the nitrogen oxides, and is not hydrogen.

with weaker acid, nitric oxide; with still weaker acid, nitrous oxide; and with very weak acid, ammonia. The product, however, is never pure, two or three of the compounds as a rule being formed simultaneously.

*Nitrogen peroxide* can be obtained by the action of strong nitric acid on metals, by the action of heat on certain nitrates, when it is evolved together with oxygen, and in many other ways.

EXPERIMENT 117.—Heat a small quantity of lead nitrate in a dry test-tube; observe that orange-brown nitrogen peroxide is evolved and a yellow residue of lead oxide is left— $Pb(NO_3)_2 = 2NO_2 + O + PbO$ .

Nitrogen peroxide at low temperatures is a white solid which at  $-10$  deg. C. melts to a liquid which is at first colourless, but as the temperature rises becomes yellow, gradually darkens in colour, and at 22 deg. C. boils. The orange-brown nitrogen peroxide, if heated, continues to darken, and at about 140 deg. becomes almost black. The changes in colour accompany changes in the constitution of the compound. At low temperatures, when colourless, the molecules have the composition  $N_2O_4$ , but as the temperature rises they gradually decompose into simpler molecules of the composition  $NO_2$ , thus  $N_2O_4 = NO_2 + NO_2$ . The change is complete at about 140 deg., but at lower temperatures the gas is a mixture of the two kinds of molecules, the proportion of the simpler compound being greater the higher the temperature.

Nitrogen peroxide dissolves in water, forming a mixture of nitric and nitrous acids. Thus  $2NO_2 + H_2O = HNO_3 + HNO_2$ , but unless the liquid is kept cold, the nitrous acid decomposes. If the gas is passed into a solution of an alkali, a mixture of a nitrate and a nitrite is obtained,  $2KHO + 2NO_2 = KNO_3 + KNO_2 + H_2O$ .

EXPERIMENT 118.—Place a small quantity of tin (not tin plate) in a small flask fitted as shown in fig. 22. Place the end of the delivery tube in water, and pour a little strong nitric acid down the funnel tube. After some time, test the water with litmus; it will be acid. Add a small quantity of the solution to a mixture of dilute starch paste\* with a small quantity of potassium iodide; a deep-blue colouration will appear, because the nitrous acid liberates iodine from potassium iodide, and the iodine unites with starch, forming a deep-blue compound.

EXPERIMENT 119.—Make a similar experiment, but pass the gas into a small quantity of caustic potash solution. When the gas is no longer absorbed, carefully concentrate the solution, and crystals of potassium nitrate will be obtained. To prove the presence of a nitrite, add a small quantity of the solution to starch paste and potassium iodide and *acidify* with acetic acid; a deep blue colouration will appear. A nitrate (e.g., potassium nitrate) gives no blue colouration under these conditions. Try it.

*Nitrogen trioxide*  $N_2O_3$  exists at low temperatures as a deep-blue liquid; but this decomposes even whilst still very cold, giving off an orange-brown mixture of nitrogen peroxide and nitric oxide, with some undecomposed trioxide,  $N_2O_3 = NO_2 + NO$ . With water, nitrogen trioxide forms *nitrous acid*,  $N_2O_3 + H_2O = 2HNO_2$ , and hence it is called *nitrous anhydride*. Nitrous acid, however, decomposes, especially on heating, into nitric acid and nitric oxide,  $3HNO_2 = HNO_3 + 2NO + H_2O$ .

The salts of nitrous acid, i.e., the *nitrites*, are more stable. Potassium and sodium nitrites can be made by the action of heat on the nitrates.

\* To make starch paste: Grind a small quantity of starch with some cold water, and pour the white liquid into a larger quantity of boiling water, and boil until the starch becomes transparent. Sufficient water must be present to make the solution quite limpid when cold; and it must be quite cold before being used.

EXPERIMENT 120.—Heat some potassium nitrate very strongly in a test tube, test with a glowing splint, and observe that oxygen is given off. After some time allow to cool, dissolve the residue in water, and test for a nitrite by adding some of the solution to starch paste and potassium iodide and acidifying with acetic acid,  $\text{KNO}_3 = \text{KNO}_2 + \text{O}$ .

Most of the nitrites are soluble in water; silver nitrite only dissolves to a small extent.

EXPERIMENT 121.—To a strong solution of potassium or sodium nitrite add a strong solution of silver nitrate; silver nitrite will precipitate as a yellowish crystalline substance. Warm the liquid gently until the precipitate dissolves, and allow to cool slowly. The silver nitrite will crystallise in slender needle-shaped crystals.

Under some conditions, *e.g.*, if heated with carbon, or mixed with ferrous salts, nitrites are oxidising agents; under others they are reducing agents.

EXPERIMENT 122.—Acidify a solution of potassium permanganate strongly with sulphuric acid, and add a solution of sodium or potassium nitrite. The purple colour will be completely discharged, the nitrite being oxidised, and the permanganate being reduced. If some of the gas in Expt. 118 is passed into acidified permanganate, or some of the solution of the gas is added to it, the colour will be discharged,  $2\text{KMnO}_4 + 3\text{H}_2\text{SO}_4 + 5\text{HNO}_2 = 5\text{HNO}_3 + \text{K}_2\text{SO}_4 + 2\text{MnSO}_4 + 3\text{H}_2\text{O}$ .

(To be continued.)

## Photo-Micrography.—VII.

BY ANDREW PRINGLE.

### DEVELOPMENT.

WE now come to an operation to which my method of treating this subject has given even greater importance than usual; for, as will be remembered, I said that the best criterion of exposure is the appearance of the plate under development.

The developers which I chiefly recommend are the hydroquinone, or quinol, and the ordinary pyrogallol and ammonia. Hydro has the advantages of great "clearness" and power of density, which in our work are advantages not lightly to be overlooked. When from the nature of the subject it is desirable to avoid great contrast, and to get a negative full of gradation, then I use and recommend pyro and ammonia; and while one worker will as a rule require one class of result, another may need a different, according to the subjects with which each has to deal.

For pyro and ammonia I make the usual 10 per cent. solutions of these two reagents, and a similar solution of ammonium or potassium bromide. The pyro may be preserved with sodium sulphite or potassium metabisulphite, according to any approved formula and to taste. I use the hydro formula given by Messrs Thomas and Co., but I dilute it with one or one-half measure of water, according to the nature of the subject. Low-power work and thick or heavily stained objects are as a rule better rendered with the pyro developer; while, generally, weakly stained or unstained objects come out better after hydro treatment of the negative; but these are generalities and not rules.

For the pyro developer the following proportions will answer in ordinary cases:

Pyro	..	..	..	..	2 gr.
Ammonia	..	..	..	..	2 to 3 minims.
Amm. or pot. bromide	..	..	..	..	$\frac{1}{2}$ to 1 gr.
Water, to	..	..	..	..	1 oz.

Those who are in the habit of using a carbonate in place of the liquor ammonia may very well use their favourite alkali; in fact, it has the advantage in the matter of clear shadows, which is often important in our work. The following will do for such a developer:

Pyro	..	..	..	..	3 gr.
Sod. carb.	..	..	..	..	10 "
Water	..	..	..	..	1 oz.

to which half a grain of soluble bromide may be added.

First it should be remarked that if we are using colour-correct plates we must look well to our window or lamp-glass, for yellow will not do for these plates, or rather it *will* "do for" them! The light must be ruby.

I do not recommend "tentative" development for this work, because one of the chief points according to my teaching is to judge of exposure by the effect of a given developer; and moreover it is generally easy to repeat an exposure that has proved erroneous.

We begin to develop, then, with the full strength as given above; and we watch very carefully what happens when the developer begins to act and when the image first begins to appear. If the image does not put in an appearance within a minute or so—the exact time will be learned by experience—it may safely be judged that the exposure has been insufficient.

If the image begins to appear within a few seconds after the application of the developer, and if it comes up grey and without pluck, then, as all know, it is certainly over-exposed. A negative of a subject full of contrast will probably show some of its image-details more quickly than a negative of an object without strong contrasts, but experience will lead to correct judgment of this also.

I may say that if any part of a plate develop *dense* black at any part of the operation, that plate is almost certainly under-exposed; no part of a negative during development should appear extremely dense or black. On the other hand, the whole of the image should not appear grey or of nearly one tone, for this is almost surely a proof of over-exposure. As to the rapidity with which the details should follow each other into sight in development, a good deal depends on the nature of the subject. There must be no lagging of appearance, especially if the object is one with strong contrast; nor must details rush up one after the other, especially if the object is a thin or little-contrasted one; the first would show under, the second would show over exposure. Details should follow each other gradually, steadily, unceasingly, till they are all visible, not necessarily distinct from one another, but still *there*. After details are all "up," some little time is needed for acquisition of density—that is, if the plate has been sufficiently exposed. If the plate has not had enough of exposure, some parts of the plate will have too much density by the time all details are visible. If the exposure has been grossly in defect, the plate will not take density in any part; if the exposure has been a little too long, the plate will turn black all over, or nearly all over, very soon; if it has been a great deal too long, the image will at once become grey and will refuse to show signs of density, however much we may prolong the development.

To recapitulate briefly—

Soon after the image has begun to appear—

Dense black all over means slight over-exposure.

Grey all over means great over-exposure.

Instant flashing up means utter over-exposure or fog.

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

The image not appearing for a minute means under-exposure.

High lights grey, shadows wanting, means great under-exposure.

High lights dense black, shadows dirty grey, means slight under-exposure.

"High lights appear after 15 to 30 seconds, grey at first gradually darkening, shadows creeping up steadily all the time; finally high lights, black, and shadows ranging from pale to dark grey—correct."

With regard to the necessary amount of development, much depends on the nature of the subject. For example, a subject presenting violent contrast of detail—whether the contrast is due to density or to colour—will not need to be developed to such a point of density as a subject of delicate gradations. But, on the whole, a micrographic negative should be developed to a further stage than a negative of a landscape or of a portrait, especially if there is any chance of the negative being required for "process" printing. I may tell the young photomicrographer that one never knows when our scientific friends will discover beauties in our work that we never should have discovered for ourselves!

After development, our negatives require no unusual treatment. They are washed and fixed as usual, and after fixing, it is well to give them an extra good washing, for it is not unlikely that they may need some after-treatment and reduction or intensification; and moreover, I do not advise varnishing of micrographic negatives, for the danger of loss of an amount, however slight, of sharpness.

We are told that neither intensification nor reduction alters the proportional density of the silver deposit in a negative, and this seems to be fairly accurate. But we can most emphatically alter the *printing proportions* of our negatives, or the "values," if I must use a fine-sounding word; and after all, that is what we require and expect when we intensify or reduce. We find after development that we have a negative full of details, but the negative will not yield a reasonably plucky print. Then we intensify it. Or our negative is very dense all over and takes a very long time to print, and prints very black and white; then we can with ease and certainty reduce it.

For intensification nothing acts better than the ordinary mercuric chloride, in saturated aqueous solution, followed after washing by a weak solution of sodium sulphite. We must take great care to let the latter solution act till the image is brown *right to the back of the film*; many negatives are lost by neglect of this precaution, for such negatives go wrong after a time to a certainty. Weak ammonia may be used in place of sulphite, and gives even greater additional contrast and density, but when a negative requires a very great reinforcement it is usually better to try another exposure.

Before intensification the negative should be treated with acid alum, the acid being preferably hydrochloric; and a little of that acid should be added to the saturated solution of mercury.

I almost always use Mr. Farmer's reducing solutions of potassium ferricyanide and hypo, and the system works to my satisfaction. The action must be carefully watched, for fine details must not be endangered.

(To be continued.)

**Erratum**—Our correspondent, Mr. C. H. Freeman, says:—"In printing my reply to No. 4577, 'Electric Light for Dark-room,' an error has crept in which makes the answer seem rather ridiculous. Instead of, 'But if he only requires it for about two minutes at a time,' as printed, it should be, 'But if he only requires it for about twenty minutes at a time.'"

## Photographic References.

By MAJOR J. FORTUNÉ NOTT.

### DEVELOPMENT.

(Continued from page 209.)

ANOTHER feature regarding this important subject of development, which must at first tend to cause considerable confusion in the mind of one who is just beginning the practice of the fascinating art of photography, is the number of developers which he will find are available for his purpose. And on a closer examination of the subject not only will he find that he has a wide choice of the chemical mixtures known in photographic parlance as developers, but that the variations that can be rung upon the amount of their constituent elements, as recommended by the various guides on this subject, add largely to the puzzling question which he has to solve. The best advice that can be given anyone so situated is to work with the formulæ recommended by the maker of the plates he has been using, and to continue doing so until he has gained that amount of practical experience which will justify him in experimenting with the various other forms of developers, in order to acquire the information which is essentially necessary for everyone ambitious to excel as a photographer, namely, the developer which will in his hands yield the best results. Meanwhile, any knowledge he can acquire respecting the action of the chemicals he will have to use will be of assistance to him in detecting the weak or strong points in the various formulæ which will come under his notice.

In order, therefore, to assist him in this object, it now comes in order to enumerate in as concise a manner as possible the various developers which are at present favoured by photographers, and to give some information regarding their chemical compounds.

These developers are known under the following names: The pyro developer, ferrous oxalate developer, hydroquinone and eikonogen developers.

Referring to the first and most important of these developers whose chief constituent is pyrogallol acid. This compound is sometimes called "pyrogallol," which would appear to be a more correct name for it than pyrogallol acid, for as a matter of fact, it does not possess any of the characteristic properties of ordinary acids, hence should not be associated with them even by name. It is produced from gall-nuts or gallic acid, and is one of the most powerful reducers which is now known to photographers. A solution of pyrogallol without any other addition will develop the image upon an exposed plate, but its action is so slow and its staining capabilities so considerable, that under ordinary circumstances this method of procedure is not a practical one. Its action has, therefore, to be stimulated to the requisite speed, and this is done by the addition of a certain amount of either of the following alkalies: ammonia, soda, or potash. The effect of using either of these ingredients with pyro in the prescribed quantities, or of using any two of them in combination in the same way, is so marked that they are called by photographers "accelerators."

Pyrogallol when in solution very quickly oxidises and becomes discoloured on exposure to the air, especially if the water employed for the purpose contains any impurities. Distilled water should therefore be used whenever possible, not only for making this solution but all others which have to be made for photographic purposes. Pure chemicals and pure water are essential for good results in the developing-room. If distilled water cannot be procured, then the water should be thoroughly boiled, and allowed to cool before being used. *Propos* of this subject the attention of photographers was called some time ago to the fact that Salu-

taris water was simply distilled water aerated, and therefore when procurable, supplied their requirements in this direction.

Mixing the solution with distilled water is, however, not the only way in which the photographer can preserve the purity of the pyro, when in use, and so extend the time that its action will remain sufficiently energetic for his purpose. An additional preservative is found in the salt known as sulphite of soda. A certain amount, generally about the proportion of 4 of sulphite to 1 of pyro, is added to the solution. It restrains to a certain extent the action of the developer, but its most useful power lies in its capacity for preserving the pyro solution in proper condition for a considerable length of time, and when the complete developer is mixed and being used will prevent it from so quickly discolouring as would otherwise occur. It moreover tends to prevent the plates getting stained—a feature of alkaline pyro development of frequent occurrence when sulphite of soda is not added. It is, of course, quite possible to dispense with its use, and so limit by one the chemicals to which a photographer has to resort, but in such an event the pyro must be kept dry, and not made into a solution. With experience this is, perhaps, the best method of development, for more reliance can be placed upon the strength of the ingredients forming the developer, but for the ordinary requirements of the average amateur the pyro solution with the preserving influences of the sulphite is doubtless the most practical way it can be used. And after all it may be questioned whether it is not the most simple method, for with dry pyro and no sulphite, not only stained plates but stained fingers in a superlative degree will more often result than not, and so necessitate clearing baths and other messes whose use in the other event can by care be easily obviated. The colour of the resulting negative is also a feature worthy of some consideration, especially in the dull days of winter when speed in printing may be a matter of some importance, and the use of sulphite will in this respect be found a distinct gain in the generality of cases.

Sulphite of soda is, however, one of the most unstable chemicals with which the photographer is brought into contact, for on exposure to the air it deteriorates rapidly by absorbing oxygen, and forming the compound known as sulphate of soda, which is a very useless adjunct to any developer. Care must therefore be taken to buy sulphite of soda from a perfectly reliable chemist, and to use it as soon as possible after the bottle has once been uncorked. With care it can be preserved, but the best method of procedure is only to buy it in the exact quantities required for the solutions being prepared. It should be in crystals, with each one appearing clean, and showing no signs of white powdery deposit on the surface. If the lumps exhibit any signs of deterioration, reject the sample or make the chemist test it with hydrochloric acid and barium chloride.

In this country many photographers of extensive experience prefer the developers made with ammonia to those made with any of the fixed carbonates which are more largely favoured on the Continent and in America. Ammonia in skilled hands has undoubtedly some advantages, but it also has many drawbacks. Certainly it is not a developer the writer would recommend for a beginner to commence practising with. Its advantages are that it acts quicker in forcing out detail than soda or potash, that it produces clear-coloured negatives with a wide range of gradation, and for purposes of transport occupies comparatively but little bulk. Its disadvantages are more numerous. Ammonia loses strength rapidly every time the bottle containing it is uncorked, consequently no certainty can be placed upon it in this respect without subjecting it to a test; its odour is objectionable and unhealthy; there exists a certain amount of danger in its use if carelessly

handled before dilution, and many plates that will yield perfect negatives when treated with any other class of developer will not stand ammonia. Again, a serious drawback to its use by unskilled operators lurks in the fact that it has a much greater tendency to produce every kind of chemical fog than any of the fixed carbonates. If, therefore, among the numerous formulae that are open for selection one containing ammonia is chosen, it must be remembered that it has to be handled with much greater care than is requisite with potash or soda, and that when "forcing" is necessary, the plate should be given time, in preference to the method necessitating an increase in the quantity of the accelerator beyond the normal limit.

(To be continued.)

## Eikonogen Compared with Hydroquinone.

By M. H. REEB.

IN our issue of February 20th, we published the précis of an article by M. Reeb on hydroquinone, and we now give the summary of a later paper by him upon eikonogen.

Whilst hydroquinone oxidises in the presence of an alkali, eikonogen oxidises without alkali in the neutral and acid state, and also very rapidly with alkalis. Weight for weight the oxygen absorbent power of eikonogen is one-fourth that of hydroquinone. "The salient points of eikonogen, from a photographic point of view, are its great avidity for free oxygen, its property of reducing the salts of silver in an acid liquid, and the insoluble salts of silver with the aid of an alkali, and by the mere addition of sulphite of soda." It is evident then that eikonogen gives two kinds of developers (1) alkaline developers; (2) simple developers with the addition of sulphite only, and M. Reeb gives the result of his experiments in both directions.

(1) Determination of the reducing power of eikonogen. This was determined in the same way as for hydroquinone, and the result was 0.33 grammes of eikonogen just reduced 1 gramme of nitrate of silver.

(2) Determination of the quantities of alkalies and of their carbonates, corresponding to a given quantity of eikonogen.

The quantities were found to be exactly the same as for hydroquinone, viz. :—

Potassium hydrate (caustic potash) ..	0.33	gram.
Sodium " (caustic soda) ..	0.2353	"
Potassium carbonate .. ..	0.4064	"
Sodium " .. ..	0.8411	"

Therefore the above quantities of alkalies should be added to .33 grammes of eikonogen.

(3) Determination of the quantity of sodium sulphite necessary for the perfect working of the developer.

This was also determined in the same way as for hydroquinone, and the following results were obtained :—

(a) That if eikonogen be added to an alkali or alkaline carbonate, the quantity should be the same in both cases, viz., ten times the weight of eikonogen.

(b) If eikonogen is used without alkali, the proportion should be five parts of sulphite to one of eikonogen.

M. Reeb winds up by stating that in his opinion there is no doubt that hydroquinone is far superior to eikonogen, and gives the two following formulae for comparison :—

1.

Hydroquinone .. ..	8.0	gram.
Sodium sulphite .. ..	40.0	"
Potassium carbonate .. ..	40.0	"
Distilled water (e.g.) .. ..	1	litre.

	2.	
Eikonogen .. ..	33 gram.	
Sodium sulphite .. ..	330 "	
Potassium carbonate .. ..	40 "	
Distilled water (e.g.) .. ..	1 litre.	

## Exhibitions.

### LIVERPOOL INTERNATIONAL PHOTOGRAPHIES.

#### No. IV.

(By Our Special Correspondent.)

THE public appreciation of the Liverpool show is proved in the fact that upwards of 30,000 people will have passed the turnstiles; the function which was to have run a month has been extended to over five weeks, and, all round, the success of the exhibition has far exceeded what it was expected to be. Last Saturday was a very big day, as was last Monday. On Monday two large audiences, in addition to those in the exhibition proper at the Art Gallery, attended at the Rotunda Lecture Hall adjoining, to hear "Iceland," by Mr. Paul Lange, and "Ober-Ammergau," by Mr. W. Lamond Howie. Needless to say, both lectures were received with enthusiasm. Extra "shows" also were given.

During this week promenade concerts will be given daily, and lime-light demonstrations.

#### PICTURES (CONTINUED).

Turning to the pictures again, I resume at Class XXII., 776 to 798; hand-camera work; 5 in. by 4 in. and under; street scenes, town life, country scenes, animals; set of six pictures. This is one of the best contested and most commendable classes in the show, and is contributed to by some two dozen workers. John White takes the silver medal with No. 787, his studies being (1) "Abandoned," (2) "Going to the Fair," (3) "An Interloper," (4) "On Grand Canal," (5) "Haymakers," (6) "For Liverpool" Major J. D. Lysaght, in 777, shows a nice half-dozen, as does W. H. R. Henry in 778, though the tone of the latter are a little "off." They are an exceptionally good set, however. W. D. Welford's 780 are good, and A. R. Dresser's 781 are excellent. All Mr. Dresser's are a nice even colour, but the blue mount detracts from the effect. Mr. J. Milman Brown has very creditable animal pictures in 779. Cecil Shadbolt's six views at Inversnaid, Loch Lomond, 783, are prominent, as are 784 by A. W. Gottlieb, and 785, by E. A. Councell. J. Catto has chosen six good subjects in street scenes, 788, and has worked them out exceedingly well. Mr. A. F. Stanistreet's No. 791 and Henry Lupton's 793 are good, and A. Grillon shows up well with 794. Other excellent work is exhibited by H. Wilkinson in 797, and W. Tomkinson in 798. Mr. Tomkinson's 2, 5, and 6 are particularly to the fore. The geese are, perhaps, the best study in Mr. Wilkinson's set.

In Class XXIII.—804 to 817, hand camera work, 5 in. by 4 in. and under; marine scenes, clouds, waves, sea-side work; set of six pictures—there is also exceptionally good work shown; fourteen competitors contribute. A. G. Bristow with 805, and J. M. Nicholson with 811, are bronze medal workers; both gentlemen exhibit good marine studies. In 804 A. R. Dresser has a capital six, and then A. F. Stanistreet comes with a really handsome set in fog, which comprises marine and cloud effects. In the opinion of many people this latter competitor was most unfortunate not to secure an award with this half-dozen pictures. The only point against them, I believe, was that they were in oval mounts. Nos. 807 by C. A. Timmins, 808 by W. H. R. Henry, and 810 by W. D. Welford are very commendable, and No. 814 by the Rev. C. F. L. Barnwell are very creditable. In 817 H. Wilkinson shows more excellent studies, but not so well as he can do at his best.

Class XXIV.—818 to 820, hand-camera work; games, races, or other sports; set of six pictures—is made up by three exhibitors and is the smallest class in the exhibition. W. D. Welford gets the bronze medal with No. 819, which include: (1) "Tennis," (2) "Cricket," (3) "Acrobats," (4) "Skating," (5) "Skating," (6) "Tight Rope Walking." In 818 John Woolfall has six splendid studies of tennis, exceptionally good, but, like other exhibits, seemingly passed over because of the mounts, which in

this case are two cream screen fans, a trio of pictures on each. W. Tomkinson exhibits another good set in 820.

Class XXV.—825 to 840, instantaneous work; half-plate and under; any subject; set of six pictures—is made up of the work of fifteen exhibitors. The studies reach a high level both for selection and execution. Karl Greger is awarded the silver trophy with 837, a very good six. Nos. 827, H. Harvey George, and 828, Louis Meldon, are excellent, a wave in Mr. Meldon's frame not being quite up to the mark. No. 831, Charles Reid, is another meritorious half-dozen. Charles Scolik in 825, Joseph Scholefield in 832, and other workers are fairly represented.

#### APPARATUS (CONTINUED).

Messrs. Horace Lewis and Company, Bold Street, Liverpool, show, among other novelties, the "Demon Rocker," which in development presents a "dead centre," the largest lens, 18 in. by 20 in., in the Exhibition; some specimens of Kallitype; and several cameras, among which are the "Guinea Detective," the "Magazine Camera," "Stereoscopic Hand Camera," "Stereoscopic Camera," Griffith's Patent "Lantern Slide Camera," "Fixed Enlargement Camera," and the "Optimus." A patent magazine, carrying twelve plates, is attached to the "Magazine Camera," which can be used in lieu of dark slides. Another feature is that the inner shelf of the magazine can be removed and changed for a duplicate in such a way as to obviate the necessity of a dark-room. The price of the changing bag is £2 2s.

Mr. James Thompson, Lintmill, Port Gordon, shows an improved "Scotia Camera," and the "Balancing Camera" of new design. The latter extends equi-distance backwards and forwards, so that a perfect balance is secured on the tripod. This arrangement tends to considerably reduce the usual vibration experienced when using long-focus lenses. The range of extension is great—from about three times the longest side of the plate, down to that required for short-focus lenses. The "Balancing" camera is about the same size as the "Scotia" when closed, and is light and portable.

## Notes from Paris.

THE French astronomers are contemplating a gigantic project in which photography is to take the most important part. This is nothing less than a huge photographic map of the entire heavens. Early next month fifty-six astronomers, representing eighteen observatories situated in different parts of the world, will meet at Paris to arrange the details of the scheme. France is represented by four observatories,—Paris, Bordeaux, Toulouse and Algiers; England will have two—Greenwich and Oxford, and Capetown, Sydney and Melbourne amongst her colonies; and there will also be scientific men from the observatories of Helsingfors in Russia, Potsdam in Prussia, the Vatican and Catania in Italy, San Fernando in Spain, Tacubaya in Mexico, Rio de Janeiro in Brazil, Santiago in Chili, and La Plata in the Argentine Republic.

It is proposed that at all these points a series of photographs of the entire heavens shall be taken on some fixed date, or rather dates, for it is calculated that each plate will include about 4 deg. of the sky, and that therefore about 10,000 plates will have to be taken. But as there are to be two series of photographs, one instantaneous and the other long exposure, there will be over 20,000 plates—and what is far more difficult—to be classified, arranged, and mounted.

It is expected that the instantaneous photographs will show about a million and a half stars, and the long exposure plates will reveal from 15 to 20 millions, for the camera can detect thousands of stars, where a good telescope can only find hundreds, and the "undressed optic" can but see tens.

When these photographs have been all taken, and forwarded to Paris, they will be mounted by the astronomers of the Paris Observatory on two huge globes each about 70 ft. in circumference.

Sylvain Dornon, the shepherd of the Landes who is making a journey from Paris to Moscow on stilts, has been the object of much attention on the part of amateur photographers, both at starting and whilst on his road. At least three "snap shots" were taken at him as he left the Place de la Concorde, and he has not escaped the provincial and German cameras which have been turned on him between Paris and Cassel, where, according to last accounts, he had arrived.

## THE LONDON STEREOSCOPIC AND PHOTOGRAPHIC COMPANY, LIMITED.

THE sixth ordinary general meeting was held last week at 106 and 108, Regent Street, W., under the presidency of Mr. Howard J. Kennard, the Chairman of the company.

The Chairman said: Gentlemen, the few remarks I shall have to make to you to-day, I think will all be of a very favourable character. Last year, if you remember, we met in this room for the first time, and the shops and show-rooms were then barely finished, and not furnished. We did not find much advantage from our alterations before the month of June. In the months of April and May we were in a transition state. Our rooms were all upset, and we found that the trade, although it went on about as usual, showed no increase, but after May, forward to the end of the year, we found a very marked improvement in our trade, which I must think was caused by the money that has been laid out on this property, and in making the establishment of the Stereoscopic Company, I think I may say without egotism, the finest photographic establishment in the world. Undoubtedly, a large sum of money has been spent on it, but the directors confidently anticipate that the interest on the money will be quite covered by your extra receipts. However, I told you on the last occasion that there was no option with us: we were turned out of the buildings on the other side of us, and therefore it was necessary for us to take these premises. The leases that we bought from the former owners run up to the end of the Crown lease, so at the end of the lease we become tenants of the Crown. I may tell you that the returns this year have been eminently satisfactory to your directors. I may say that the improvement all took place in the last six months, although we had to pay interest on the money for the year. I look forward that with increase of trade, and with the increase of our mechanical printing arrangements, that this will be an exceptionally good year. The shop you see downstairs and the room you are now in I think could not be better, and the lift also, which takes the sitters up to the operating rooms, has had an exceedingly good effect. Ladies attending Court can come into the building by a private door in the side street, and can be taken straight up to the operating rooms without the necessity of changing their dresses. Now as to the staff. I am happy to say that we have a very excellent staff at this establishment, and that it would be impossible to find a more efficient one than we have. They all work cordially together, each department assisting the other in every way that can be desired. Now as to the commercial department. In the mechanical printing we have been printing from three machines. Those three machines—you will remember on the last occasion that we showed you a number of proofs produced on them, and which were left on the table for you to take away—those three machines we have had in operation during the whole of last year, and we found that the business was so enormously increasing that we have added to the building in which they are, by putting on three stories instead of two, and we have purchased three more machines from Germany, and we are now assured by the manager of that department that there would be no difficulty whatever in keeping those six machines constantly going. That will mean a very large increase in our receipts. With these remarks I beg to move the adoption of the report, which you will see recommends a dividend of 5 per cent., and

Mr. William Clarke (director) seconded the resolution, and expressed his gratification that the company possessed such a valuable manager as Mr. J. L. Mitchell. In his opinion they could not have a better representative than that gentleman.

Mr. M. Blankley then proposed, Mr. Cuthbertson seconded, the re-election of the retiring directors, Messrs. Howard John Kennard and Malcolm A. Laing, which was carried.

The Chairman returned thanks on behalf of himself and colleagues, and stated that the position occupied by himself and his co-directors was different from that of ordinary directors in a commercial concern, because they were such enormous shareholders, and he assured them that the affairs of the company were now looked after with even closer attention than was the case when it was a private firm. It would be their endeavour to continue to promote in every way the interests of the company, which would be as much to their own interest as to that of the shareholders.

The Chairman said that he now wished to have the pleasure of being allowed to propose a cordial vote of thanks to the

general manager and staff of the London Stereoscopic and Photographic Company. As he said before, nothing could be more satisfactory than the way in which they all did their work. They had an indefatigable worker in their general manager (Mr. Mitchell), and he thought it only right that his services, and the services of the secretary (Mr. S. M. Clarke), and of the heads of departments and staff generally should be recognised, and that the meeting by a formal expression of thanks should show that it was satisfied with the zeal and energy displayed by those gentlemen in their interests during the past year.

Mr. William Clarke seconded the motion, which he stated met with his entire approval, and he could only endorse the remarks of the chairman as to the valuable services rendered by those gentlemen during the past year.

The motion was carried, and the Chairman requested the general manager to convey the expression of the shareholders to the heads of departments. Subsequently several parties of shareholders and pressmen made a tour through the various studios under the able guidance of Mr. Mitchell and Mr. T. Bastin, and much satisfaction was expressed at the completeness with which everything connected with the art of photography was carried out.

## NEW PREMISES OF MESSRS. ADAMS AND CO.

WE have lately paid a visit to the admirable show-rooms of Messrs. Adams and Co. in Charing Cross Road, underneath the new habitat of the Camera Club. The photographic trade has prospered very considerably during the last five years, and dealers are pushing westward. Messrs. Adams and Co. showed themselves to be men of business enterprise when they made a bid and secured the splendid ground floor of the Camera Club buildings, which they have fitted up and finished in a manner reflecting credit upon the management, and which will, in connection with the extensive stock of apparatus and material, secure for the firm an extensive patronage. We saw several novelties, and were promised the sight of others on a future call. The first presented to our notice was the new 1891 pattern "Ideal" hand-camera, which presents several important improvements on the previous one. The lens is now one of a new series of English-made lenses that Messrs. Adams and Co. are introducing under the name of the "Club" series, and we shall give a more detailed report on these at some future time. The lens covers perfectly at  $f/8$  and is of 5 in. focus. The shutter is one specially designed for this camera by Mr. Newman, and it possesses several features which are quite new. It can be worked as a time shutter or is arranged to give any exposure from one-fourth to the one-hundredth of a second, and the duration of exposure is not regulated by any leather or india-rubber break, which is so liable to get out of order, but by Newman's well-known pneumatic regulator; it has only one movement across the diaphragm slot, and immediately after the exposure has been given, the lens is automatically covered and the shutter re-sets itself, and is again ready for another exposure, so that there is no chance of the plate being light-struck during the re-setting of the shutter. Another ingenious and useful idea is the combination of the lens cover with the finders' covers, so that it is perfectly obvious that one cannot release the shutter and change the plate and then find that the lens was not uncovered. Special guides have been provided in the interior of the camera to prevent any possibility of a plate sticking, which is effected, as in the last model, by merely pulling down a lever and pushing it back. An indicator at the side of the camera shows at once how many plates have been exposed. The levers actuating the shutter and for changing the diaphragm or plate are all at the bottom of the camera, so that there are no obtrusive knobs or projections apparent.

Another new hand-camera, "The Adams," has just been perfected. These have at present only been made to order. They have many novel points which we may again refer to. We also received a general outline of a new tripod, which, as our informant said, "will be a revolution in tripods," and, judging from what we heard, we can quite endorse this opinion. A new lantern-slide-making camera, and a new developing sink and stand at a very low price, are also promised. The force of invention can surely go very little farther, for in the "Club" camera we have as light and as elegant an instrument as anyone can wish to handle. The

one we examined, half-plate size, is the lightest and most compact camera we have yet seen, and is very easily and quickly set up, and is provided with an arrangement so that wide-angle or long-focus lenses can be used, and a turntable with special cam lever locking arrangement which prevents any shifting when once the subject is arranged on the focussing screen. At the same time the instrument is very firm and rigid, and is of first-class wood and workmanship, and we noted also that nearly all the working parts were of brass and metal worked on metal, thus ensuring perfect firmness and holding power.

It is, of course, quite impossible for us to give any idea of the magnitude of the stock or variety of apparatus to be seen. Doubtless Messrs. Adams and Co. will make these known through our advertising columns. Still, we should advise those of our readers who want anything for the coming season not to fail to pay these new premises a visit, and many will find them handy, being only about five minutes' walk from Charing Cross.

## Round and About the Clubs.

### CROYDON CAMERA CLUB.

BRAITHWAITE HALL, Wellesley Road, on the premises of the Church Institution, is only two or three minutes' walk from East Croydon station. It is an admirable hall for a photographic exhibition, and in an excellent position for a society's meetings. The use of this hall the Croydon Camera Club has secured for itself, and on Tuesday, Wednesday, and Thursday the annual exhibition of members' work was held there, and to it between 200 and 300 prints were sent in, ranging in size from quarter-plate to an enlargement 24 by 19½. There were, however, only three classes: one for the AMATEUR PHOTOGRAPHER Silver and Bronze medals; one for architecture; and one for general work for the society's medal.

The society is young, and under the circumstances extraordinary work was not to be looked for, and yet there was in much of the work evidence of taste and no little skill in manipulation, but, on the other hand, more than one print showed unmistakably signs of careless trimming and mounting. In Class A, for general work, the medal was taken by Mr. G. Corden, the print being the enlargement of a fine snow scene, called "The Bridle Path, Beddington;" its size was 15 by 12, and it was very delicate and artistic. Mr. G. H. Elliott's print of "Arundel Park" was highly commended, whilst "Waiting to be Fed," a picture of swans by Mr. Blow, was commended; both prints showed careful work. An enlargement of the "Waterfall at Virginia Water," by Mr. White, was deserving of notice, as was also a print of some orchids by Mr. Isaacs. Besides his prize picture, Mr. Corden sent in several other prints and enlargements, notably a "View from Addington Hill," and "Rodney Weir," the exposure of the latter being exceedingly well timed. Mr. Maxey's enlargements of a view at "Beddington" and "Godshill Church, Isle of Wight," were very creditable, as was also his portrait of a boy. Mr. White was very successful in his copy of an oil painting, "The Translation of Moses." Mr. Isaac's enlargements, "Crysanthemums," showed very delicate work in the flowers and vase, but was quite spoilt by the cloth covering the table on which the vase stood.

In Class C, general work for the AMATEUR PHOTOGRAPHER medals, the first prize, silver, was taken by Mr. H. Maclean, by a picture called "A Surrey Stream," and it was really the best picture in the exhibition, composed of soft whites and greys with sufficient black to obviate the charge of flatness or monotony. It was almost Emersonian in treatment, and strongly reminded one of the doctor's earlier works. Another picture by the same gentleman, "A Surrey Mere," was prevented by the rules from taking second prize, or it would have done so. Mr. C. E. Whittaker took second place with a photograph of a St. Bernard, "Serenio," though, possibly, visitors to the exhibition may think there were other pictures more deserving of the honour. Amongst the other pictures sent in by Mr. Maclean, were "The Mole, near Letherhead," "Brockham Bridge," and "A Gateway, Rye," the latter taken, unfortunately, with a wide-angle lens. In this class there were two curious little prints—one by Mr. G. P. Waters, "The Wandle, Carshalton," and the other by Mr. Maclean, "Conduit Lane," and whether the workers were striving after "naturalistic" effects or suffered from an accident, we could not absolutely determine, but

had the prints been sent in by any other persons we should most certainly say that the paper had slipped in the printing frame. Mr. H. A. Sargeant sent a charming little picture—"In the Courtyard, Hever"—which shows a stone archway, through which a fine view of the distant country is seen. Mr. Whittaker contributed a picture—"At Limpsfield, Surrey"—which was on gelatino-chloride paper, and had apparently been so overtone in the sulphocyanide bath that it was a fine chrome yellow in colour. As a curiosity it was fine, but as a print for competition, well, the less said the better. Amongst the other pictures in the class worthy of notice were: "Croydon Old Town," by Mr. H. B. Larkins; "Still Waters," by Mr. Isaacs; and "Cygnets," by Mr. E. F. Blow.

In Class B, architecture, the competition was not keen. Each competitor had to send in a set of not less than four prints, and the views sent in seemed confined to pretty much the same neighbourhood. The medal was taken by Mr. Isaacs with four views: an interior of Lingfield Church, showing old blackletter Bible chained to the reading desk; another view of the interior; view of the exteriors of Betchworth and Beddington Churches.

Amongst the exhibits not for competition was a magnificent enlargement—a girl's head—from half-plate to 24 by 19 by daylight, by Mr. Isaacs; an enlargement of a view of "Chiddingstone," by Mr. Maxey; a set of "Views on the Lagan," by Mr. Plimmer; "A Trout Pool," by Mr. Maclean; a large portrait of Mr. Maclean by Mr. F. J. Palmer; and a "bunch of marguerites" by Mr. Maxey.

There were also some lantern-slides, very varied in value, sent in for competition, but at the time of writing the awards had not been made. Each evening there was a lantern show and an attractive musical programme, and altogether the exhibition was a great success, on which the Society is to be heartily congratulated, as is also Mr. Maclean to whose energy and ability much of the success was due.

**Survey of Glamorganshire.**—The Committee of the Cardiff Free Library and Museum having determined to form a collection of photographs of objects and places of interest in the county, the Cardiff Photographic Society has commenced a photographic survey of the county, and has already sent in several hundreds of photographs. The Library Committee, to further encourage the scheme, have offered gold, silver, and bronze medals for the best collections of photographs sent in under the following rules: 1. Each exhibit must consist of at least twelve pictures; 2. All pictures must be framed, or mounted on cards or in books. The subject, date when taken, and exhibitor's name to be written on the front of the mounts; 3. The Committee will not be responsible for accidents to or loss of exhibits; 4. Silver prints will be eligible for competition, but photographs printed in a more permanent process, such as carbon or platinotype, will receive greater consideration; 5. All pictures exhibited shall become the property of the Free Library Committee. Exhibitors shall, however, have liberty to furnish duplicate unmounted prints, when their exhibits will be returned; 6. The judges shall have the right to withhold awards, if, in their estimation, the exhibits are not of sufficient merit to deserve recognition. Exhibits must be sent to the Cardiff Photographic Society, Public Hall, Queen Street, Cardiff, not later than August 7th 1891. Carriage of exhibits will be paid by the receivers. The exhibits will be divided into the following classes:—(1) Collection of photographs illustrating Glamorganshire, past and present; (2) Collection of photographs illustrating that portion of Monmouthshire (Newport included) within twelve miles of Cardiff; (3) Collection of photographs of the churches and chapels of Glamorganshire; (4) Collection of photographs of Cardiff, past or present; (5) Collection of photographs of Glamorganshire castles, mansions, religious houses, and crosses; (6) Collection of lantern slides illustrating the county of Glamorgan; (7) Collection of lantern slides illustrating Cardiff, past and present. The Committee will give a gold, silver, and bronze medal in Class 1. A silver and bronze medal will be given in each of the other classes. All exhibits in Classes 2 to 5 will be considered as also competing in Class 1. It is desired that the collection should comprise photographs as follows:—All buildings or places likely to be altered or removed; all parish churches (interior and exterior), together with any special features therein, such as rood screens, carved chests, etc.; monuments, or market and other crosses; castles or manor houses, and their contents, such as family portraits, old furniture, etc.; views of the coast line, docks, shipping, etc.; views of the principal streets and buildings in towns. It is suggested that descriptive readings should accompany exhibits of lantern slides, to increase their interest when shown through the optical lantern.

## WHERE TO GO.

By A. B.

PHOTOGRAPHY is a most pleasant hobby; here I am purposely repeating the kind of phrase with which so many of our articles commence, but I reiterate it with pleasure, so cordially do I endorse the sentiment. And of all its branches none excels in interest that of landscape photography. The difficulty is, for those of limited opportunities, to know where to go to get the scenery which shall come up to one's ideal. We know that each amateur in his first two years or so takes everything he comes across; nothing comes amiss to him; and in this way experience is acquired. But after a while he becomes critical, and the resolve is made to use fewer plates and make better pictures. The cycle and camera are frequently associated, but we do not quite so often hear of the association of camera and boat, yet surely it is the most natural and delightful conjunction possible; how often have I wished that in my earling boating trips I had been accompanied by my companion of recent years, the camera. We may envy those who have the leisure to roam round the world, but yet in our own land are most beautiful scenes to be found, and it occurs to me to jot down a little of my own experience, as a hint to those who delight in planning excursions for the sunny days we hope for. My mind instantly reverts to the beautiful valley of the Avon in the neighbourhood of Bath and Bradford, with which I am well acquainted, but this falls in the route I am about to mention. In 1871 I made one of a party of five on a circular boating tour through some of the prettiest river scenery in England, and for the benefit of those it may interest I will give the course taken. Shortly, it was as follows: by rail to Oxford (taking our boat on trucks), from Oxford to Warwick by canal, from Warwick along the Avon to Tewkesbury, thence down the Severn as far as Gloucester; here we entered the canal which runs to Hereford, or, more correctly, from Hereford. Carting the boat through the town, we embarked on the Wye, and followed this river to its mouth; chartering a larger boat, we towed our own across the mouth of the Severn to the river Avon, up which we rowed our own boat to Bristol, and thence to Bath. Here we took to the canal (Kennet and Avon), which brought us to the Thames at Reading. Now a glance at the map will show what places of interest the route touches, and I need only mention a few points to prove the attractiveness of the journey to camera men; first the lovely scenery of the Warwickshire Avon, apart from the attraction of such places as Warwick, Evesham, Stratford-on-Avon, Tewkesbury, etc.; the grand scenery of the Wye district, Ross, Whitechurch, Symonds Yat, Monmouth, Raglan, Goodrich, Tintern, Chepstow, etc., and the beauty of the southern Avon; then again the canal scenery is decidedly picturesque, and must by no means be supposed to be on a par with that of the canals in the home counties. In fine, to anyone who possesses a love for aquatics, and delights in employing the camera, I could not recommend a more enjoyable trip, and I would, if required, furnish fuller particulars.

## Quarterly Examinations in Photography.

**Question 29.**—What is the best method of collecting silver residues, and is this advisable for an amateur?

**ANSWER.**—Residues may be divided into classes: 1. Plates; 2. Paper; 3. Fixing baths; 4. Washing water from prints; 5. Various intensifiers and other solutions containing silver.

(A) 1. Fix, and then mix bath with No. 3.

(B) Mix 4 and 5 and add hydrochloric acid; the silver then comes down as chloride; filter off and collect.

(C) 2. Burn this, and keep the ashes.

(D) 3. Add some sulphide of ammonium or lime of potash. The silver will be precipitated as sulphide, together with some sulphur, mix the results with C. Another way is to put in scrap copper or zinc, when the silver will be precipitated as before.

Take the results of all the processes, and fuse up with nitrate of potash and powdered charcoal. The silver will be found as a button at the bottom of the crucible at the end of the operations. C.

**Question 30.**—What is known as Feer's process?

**ANSWER.**—Feer's process is a diazo process. Diazo compounds united with sodium sulphite form diazo-sulphonic salts, which with amines

and phenols in solution form colourless liquids, which can be spread upon paper or muslin, or, indeed, any substance. After drying in the dark, this can be printed under a negative. On exposure to light the diazo-sulphonic salt is decomposed, and the free diazo body reacts with the phenol or amine present, and diazo colours are formed of great intensity. The following has worked well in the hands of a friend of mine:—

Ditolyltetrazo sulphonate of soda	...	...	30 parts.
Phenylendiamine	...	...	20 "
Water	...	...	1,000 "

The process is referred to in last year's AMATEUR PHOTOGRAPHER as having been explained by Mr. Bevan. R. C. M.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Ashton.**—The monthly meeting of this recently formed society was held on the 25th ult., in the Jermyn-street Mission Room, the President, Dr. Hamilton, in the chair. The society has already 60 members, and expects large accessions when it has secured for itself a local habitation as well as a name. The meeting was well attended and the proceedings were of great interest. A discussion took place as to whether the rooms about to be vacated by the Young Men's Christian Association should be taken, and the general opinion seemed to be in favour of doing so, although the present number of members—60—might not be able to pay the rent and other expenses without some increase of subscription. After some discussion Mr. Redfern moved that Mr. G. H. Dean and Mr. Robert T. Marsland endeavour to see all the members to ascertain the financial outlook, and if from their report there was a fair prospect of being able to meet the expenditure, they be authorised to take the rooms of the Young Men's Christian Association on quarterly tenancy. Mr. Kenworthy seconded the motion. He thought it was the best suit of rooms in the town for their purpose. This was adopted. Dr. Hamilton then gave a description of the "Platinotype Process." There were three methods, but the one he should ask their consideration to was the hot process, because it was the simplest, and, in his opinion, they got pictures equal, if not superior to those obtained by any other method. Some years ago Mr. Willis, of the Platinotype Company, made a great many experiments, which resulted in his being able to bring a paper before the public which was coated with the salt of iron and platinum, and which, when exposed through an ordinary negative to the light, formed a faint image. On this being placed in a potash bath the picture was brought out. The doctor then went through the process. The potash bath was heated by means of gas to a temperature of 150 or 160 degrees. The range may vary from 130 to 180 degrees, according to the faintness or vigour of the picture desired. He found 150 the best for a well-exposed print. The print was then placed face down in the bath, the left edge first, and then lowering the rest of the paper towards the right, so as to prevent bubbles, which would spoil the picture. After being in a few seconds the paper was raised, and the audience cheered as they witnessed the fully developed picture. The picture was next washed in a bath of acid to remove traces of iron.

**Blackburn.**—The last meeting of the winter session for the exhibition of lantern slides was held on the 24th ult., the President (Major Baron) in the chair. A series of Scotch slides was put through the lantern, supplemented by a selection furnished by different members of the Society. There was a good attendance of members and friends. The programme of excursions for the summer season will be at once arranged by the Committee and issued to the members.

**Dukinfield.**—The ordinary monthly meeting was held on the 24th ult. After the election of four new members, a very pleasant evening was spent in viewing a good number of slides, "A Tour in Devonshire," etc., lent by the Manchester Amateur Photographic Society. Mr. Shirley, the President, gave a description of the different views as they were thrown upon the screen, and Mr. W. Jenkinson manipulated the lime-light lantern.

**Ealing.**—A meeting was held on the 19th ult. The chair was taken at 8 o'clock by the President. Mr. F. W. Hart, F.C.S., gave a demonstration of his method of eliminating hypo. from silver prints and plates. The process was watched with much attention by the members present. Mr. Hart also showed a new plate-washer. At the meeting on Thursday Mr. Howson was to give a demonstration on the working of Alpha plates and paper.

**Graphic (Plymouth).**—On the 23rd, after the routine business, Mrs. Lewarne was balloted for and elected a member. The exhibition of members' work was postponed until later in the season. A proposal for a survey of the county was discussed. Mr. Micklewood then gave an exhibition of a large number of lantern-slides prepared by himself, and furnished data of exposure, development, etc.

**Great Yarmouth.**—The members paid a visit on the 30th ult. to Somerleyton Hall, the residence of Sir Saville Crossley, Bart., M.P., when a good number of plates were exposed. On the 14th inst. there will be a lantern show of members' work.

**Huddersfield.**—On the 24th ult. about 200 slides by members of the Society were passed through the lantern, many of them possessing considerable merit. At the close of the meeting a print on Dr. Jacoby's chloride of silver emulsion paper, sent by Mr. Otto Scholz, was handed round for inspection and samples of the paper distributed.

**Ipswich.**—An extremely interesting evening was spent by the members and friends of the Ipswich Photographic Society on the 25th ult., when a number of negatives of views taken by members were thrown upon a screen. The lantern was manipulated by Mr. A. H. Mitchell, assisted by Messrs. J. C. Wigin and A. R. Christopherson, Mr. Leonard Hill (Hon. Sec.) reading out the titles.

**Ireland.**—A technical meeting was held on the 26th ult., Mr. H. Bewley in the chair. A paper on "Some Printing Processes" was given by Mr. M. Hedley, who went exhaustively into the subject, and exhibited a large number of prints in silver, gelatino-chloride, ferro-prussiate, platinotype, bromide, and Diazotype. Mr. Hedley advocated the use of green glass for printing as giving a pluckier picture with a greater amount of detail, and stated that it was pre-eminently suited for matt-surface paper. In support of his theory he exhibited some pictures, which were equal in every respect to platinotype prints. A discussion followed, and a vote of thanks having been passed to Mr. Hedley, the meeting closed.

**Newcastle-on-Tyne.**—The ordinary meeting was held on the 24th ult., Mr. A. S. Stevenson, J.P., in the chair. The Secretary's and Treasurer's reports were presented. A discussion on "Bromide Contact Printing" then took place, opened by Mr. J. E. Goold, who described mechanism by which he manipulated 15 by 12 printing frames, and produced thirty prints per hour from each negative. Several members contributed their experiences.

**North Middlesex.**—The first outing of the Society took place on the 22nd ult. The members met at King's Cross (Metropolitan), and booked to Rickmansworth by the new line. Considering the weather, a fair number turned up. The subjects chosen were Moor Park, the beautiful seat of Lord Ebury, whose magnificent trees and herds of deer were admired by all. The canal at Rickmansworth and adjacent rivers up to Harefield afforded lovely bits for over 100 plates. Mr. Chang, with his hand-camera, was well to the front. Not the least enjoyable event was the wind-up of the day, when all joined in a good spread at the Fisheries Hotel, Harefield.

**Oxford.**—On the 17th ult. the President (Mr. E. A. Ryman Hall)

in the chair, an exhibition of apparatus was held. Cameras, etc., were lent by the manufacturers and the members of the Society. The President described the various articles. Mr. A. F. Kerry, M.A., will give a lecture on "Bromide and Kallitype Paper Printing" on April 7th.

**Putney.**—A meeting was held on the 25th ult., Mr. T. Gilbert in the chair. The members and their friends spent a most enjoyable evening witnessing an exhibition of some 200 slides, the work of the following members—Messrs. Congreve, Faulkner, Gilbert, Gorin, Macdonald, W. and G. E. Martin, Ovey, and Ballard. The Repeater hand-camera was shown and explained at the close of the evening. Next meeting, April 8th, American slides.

**Sheffield Camera Club.**—A general meeting was held on the 25th ult., the President, Mr. G. T. W. Newsholme, F.C.S., in the chair, to hear a lecture entitled "Through North Devon with a Camera," by Professor J. O. Arnold, F.C.S., illustrated by slides from negatives taken by himself. Starting from Liverpool to Swansea, thence to Ilfracombe, the tour was graphically described, and many places of interest connected with Kingsley's "Westward Ho" and Blackmore's "Lorna Doone"—Bridport, Clovelly, Lyme-mouth, and the famed Doone Valley—were beautifully portrayed, although most of the negatives were taken in heavy rain. A number of new members were elected and others nominated.

**Wolverhampton.**—The third annual meeting was held on the 24th ult., the President (Mr. T. Ironmonger) in the chair. On the motion of Mr. H. E. Perry, seconded by Mr. W. Ratcliff, the report and statement of accounts were adopted. The election of officers was then proceeded with. Mr. Ironmonger proposed Mr. Lyons Wright as his successor. Mr. Perry seconded the motion, which was carried unanimously, and Mr. Wright returned thanks. The following vice-presidents were then elected: The Mayor of Wolverhampton (Mr. John Marston), Mr. Thomas Ironmonger, Lieutenant-Colonel Thorneycroft, Mr. C. T. Mander, Mr. G. B. Thorneycroft, Mr. J. Forsyth, Mr. L. B. Moreton, Mr. C. B. Wight-Boycott, and Mr. Harold Holcroft. Mr. Gibson was re-elected treasurer, Messrs. J. W. Evans and J. Gale were appointed hon. secretaries, and a committee was also elected. Mr. Ratcliff stated that the society, according to its present rules, was open to amateur photographers only, but he thought that now they should open it to professional photographers, or anyone else. He moved a resolution that the name of the society be altered to that of the "Wolverhampton Photographic Society," and that Rule 2 limiting the members to amateurs should be erased. This was seconded by Mr. H. M. Lord, supported by Mr. Ironmonger, and carried unanimously. The committee were instructed to draft a new set of rules, and take into consideration the holding of quarterly exhibitions of photographs by members of the society, and to report to a general meeting. Mr. Ironmonger stated that the room in which the society held its meetings was inadequate for showing lantern slides, and he suggested that the music room at the Institute for the Blind, Victoria-street, should be hired in the future. The suggestion met with general approval, and the matter was left in the hands of the president and secretary.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4588. Developer for Bromide Paper. — What

weights are used in Messrs. Morgan and Kidd's ferrous oxalate developer, apothecaries' or avoirdupois? — **FEROX.**

4589. **Developing.**—Will some one please tell me what quantities of the following 10 per cent. solutions I should use for developing Edward's Isochromatic plates? Ilford 10 per cent., pyro, ammonium-bromide, and ammonia. Also, which is best for above plates, pyro or quinol? — **FACILE.**

4590. **Pinholes.**—Will any of your readers kindly inform me which is the best remedy for pinholes which very often occur in the sky portion of the negative? I dust the plates before exposure and also before developing. — **PERPLEXED BEGINNER.**

4591. **Dark Slides.**—I intend making some dark slides and am told that wood ready grooved and prepared can be bought. Can any reader supply me with any particulars? or also if dark slide hinged shutters can be obtained? — **TE PAKACHA MAORI.**

4592. **Developer for Hand-Cameras.**—Will some one kindly give me a formula for development of hand-camera shots (pyro or hydroquinone preferred)? — **LENSIGRAPH.**

4593. **Lenses for Hand-Cameras.**—What lenses are most suited to hand-camera work? Where can I obtain them, and at what prices? I should prefer fixed-focus lens with metal dark slides. — **LENSIGRAPH.**

4594. **Hand-Cameras.**—Can any one who has used Griffith's guinea hand-camera certify that it is a reliable instrument, and much oblige — **INTENDING BUYER?**

4595. **Lighting, Backgrounds, etc.**—Can some amateur give me any hints as to the lighting, background, and exposure necessary for indoor photography, and also inform me if my Instantograph lens should be worked at its full aperture? I fail to get required density. — **ANAXAGORAS.**

4596. **Lanternoscope.**—Would some kind amateur

tell me how to make one of the above, with diagrams if possible, and oblige.—**FRED?**

4597. **Prints Curling.**—Would some one kindly inform me of the best way to prevent albumen prints from curling after toning? — **STOCKLAND.**

4598. **Houghton's Tent-Atelier.**—Can anyone who has used this give me his experience? Also want Houghton's address. — **CHARLES C. MACKLEY (Germany).**

4599. **Lens and Shutter for Detective Camera.**—Wanted to know of a good lens, and also shutter that can be set without uncovering lens, moderate in price, for home-made detective camera. — **MOGUS.**

## ANSWERS.

4551. **Florence, Exposure &c.**—This would probably be about two-thirds that required for England. — **OSIRIS.**

4553. **Dry Plates for Positives.**—If dry plates for making positives in the camera are meant, Fallowfield is the English agent for the Phoenix dry plate, an American manufacture. — **OSIRIS.**

4559. **Lens.**—A single lens is better for landscape work because there are fewer reflecting surfaces, and the image is consequently more brilliant. — **OSIRIS.**

4560. **Varnish.**  
Finest selected copal ... .. 2 oz.  
" " albanum ... .. 2 "  
Powdered glass ... .. 2 "  
Turpentine ... .. 1 pint.  
Mix and dissolve by the heat of a water bath, and add

Venice turpentine ... .. 1 oz.  
Plain linseed varnish ... .. 1 "  
Leave to settle for 24 hours in a moderate temperature and filter. Or  
Picked sandarac ... .. 4 oz.  
Mastic in tears ... .. 1 "

Powdered glass ... .. 2 oz.  
 Methylated spirit, 64 o.p. ... 1 pint.  
 When dissolved, add  
 Fluid Venice turpentine ... 8 oz.  
 A better one still, which is technically called water-proof barrel glass, is  
 Colophony, ... .. 2½ oz.  
 Shellac ... .. 3 "  
 Turpentine ... .. 9 "  
 Yellow wax ... .. 1 "  
 Methylated spirit ... .. 1 pint.

Melt the wax on a water bath, add the turpentine, shellac, and colophony, and, finally, the spirit. After one or more good thick coats have been applied of this, give the wood a coating of alcoholic shellac solution. There is hardly any varnish which will resist a strong alkali, but the last is absolutely waterproof.—OSIRIS.

4564. **Rectilinear Lenses.**—The cheapest R.R. lenses are those of Hockin, Son, and Wilson, and Vevers, of Leeds. The first-named I have used for three years with every satisfaction.—OSIRIS.

4566. **Switzerland.**—In the latter part of last year were some short leaders on snow scenes, which would give this querist all the information required. I append the following brief notes, taken from the said articles:—Give a long exposure, that is, expose for the black pines, and totally disregard the snow-covered distance; commence development with the normal quantity of accelerator and restrainer, but with about one-tenth of a grain of pyro to the ounce. When the detail begins to appear, add another one-tenth of a grain of pyro; when all detail is out, add the normal amount of pyro, with a little more restrainer.—OSIRIS.

4566. **Switzerland.**—Expose for the trees and remedy the too great density of the snow and sky by developing on the system recommended in AMATEUR PHOTOGRAPHER of December 12th, 1890, p. 414. Send for a copy if you have not one. Briefly the system is to start with as little as one-tenth of a grain of pyro to a 1½ oz. developer with 5 gr. bromide and 3 minims pure ammonia. Let this act for five minutes. Don't hurry it. Then add another tenth of a grain of pyro and develop for five minutes more. After this, add 1 gr. pyro and 5 gr. bromide. After another five minutes, if density is not sufficient, throw away developer and pour on a fresh one composed thus:

Pyro ... .. 2 gr.  
 Bromide ... .. 4 "  
 Ammonia ... .. 3 minims  
 Water ... .. 1½ oz.

Rock the dish all through the development. You can use the tenth of pyro by mixing 1 gr. in 10 dr. water, and taking 1 dr. for first two applications. The third and fourth should be used dry.—ISIS.

4567. **Hand or Instantaneous Camera.**—(1) A camera with a fixed focus (so-called) lens. (2) Roberts' hand-camera. (3) Ditto.—OSIRIS.

4570. **Exposure Meter.**—I can thoroughly recommend the "Watkins' exposure meter." It is quite reliable and very simple in use, it is very small too.—FRIDA.

4573. **Lamp Shades.**—Eastman's films could be used, but better results would be obtained by using a thicker and a translucent support, and a slower emulsion. Why not try Fry's ivory celluloid films for transparencies?—OSIRIS.

4574. **Opalines.**—I do not know how you could get bubbles if you follow the instructions well. Soak print well before putting in gelatine, and warm glass plate too. When you are putting the print on glass after leaving it soaking in gelatine for a little time, bend it in this shape U and place on carefully. If you rub it a little time before you take it out, it would be safer. Squeeze it on well. I think if you follow these directions you will succeed. The glass must be perfectly clean.—FRIDA.

4575. **Drying Prints.**—White blotting paper alone should be used, and nothing will take out the pink stains.—OSIRIS.

4576. **Print Washer.**—Marion and Co. have an excellent one which can be used either for plates or prints. Its price is plates or prints up to 8½ by 6½, 44s.; 12 by 10, 60s.—CHESTER.

4577. **Electric Light for Dark-Room.**—If F. Powell would send me his address and requirements through the Editor, I will send him some particulars.—CHESTER.

4577. **Electric Light for Dark-Room.**—It is very wrong to recommend one's own work, but as I don't know of any book giving special details suitable for one who is not an expert in electrical matters, I would recommend F. Powell to get parts 576, 577, and 578 of the *Boys' Own Paper* (February and March parts, last year), in which he will find full details on fitting up a simple electric lamp. He has only to use lamps with red globes to render it suitable for his dark-room.—R. A. R. BENNETT.

4578. **Lantern Slides.**—A good toning bath is purple-red.

Chloride of gold ... .. 1 gr.  
 Sulphocyanide of ammonium ... 25 "  
 Hyposulphite soda ... .. 240 "  
 Water ... .. 2 oz.

Dissolve gold in water and add last. Prepare twelve hours before use. This bath is recommended for

Aristotype prints. A good slide looks as well without toning as not. Get Dresser's "Lantern Slides, and How to Make Them," published by Fry Manufacturing Co., price 6d.—CHESTER.

4578. **Lantern Slides.**—If you use the Ilford special lantern plate and the developer they recommend, it is absolutely unnecessary to tone, as very fine black tones are at once obtained. It is not absolutely necessary to tone lantern slides.—OSIRIS.

4579. **Quarter-plate Converted into a Hand-Camera.**—Any camera maker would do it, but try Roberts, camera maker, Leytonstone, or Cusworth, Eagle House, Hainault Road, Leytonstone, or Mr. Platt, Birkbeck Works, Albion Road, Dalston, E.—OSIRIS.

4583. **Norway.**—End of May would not be too early, but June would be better. The following tour would occupy about a fortnight and cost from £15 to £20—Hull, Stavanger, Odde (overland), Vik (for Vordingto), Ulvik, Eide, Vossevangen, Bergen, Hull. Plenty of good work for the camera; give short exposures.—H. N. MALAN.

4583. **Norway.**—May decidedly too early. Weather probably wet, certainly cold. Route indicated very pretty one. The main expense is getting out. In Norway, 10s. a day will do you, unless you travel very hard. If "Photos" will write to me I will give him any hints I can, and I know Norway well.—R. O. MACLEOD.

4584. **Silver Stained Negative.**—If the negative is varnished, remove it and apply this (negative being put in a dish):

(A):  
 Sulphocyanide of ammonia ... .. ½ dr.  
 Water ... .. 1 oz.

(B):  
 Nitric acid ... .. ½ dr.  
 Water ... .. 1 oz.

(this will only do for one negative), and then place in a saturated solution of chrome alum.—CHESTER.

4584. **Silver Stained Negative.**—Immerse in:

Sulphocyanide of potassium ... .. 10 gr.  
 Nitric acid ... .. 5 min.  
 Water ... .. 1 oz.

and gently rub the stains with a small piece of cotton wool, but great care must be exercised in the manipulation. The following is given in the "British Journal Almanac." Apply the following:

(A):  
 Sulphocyanide of ammonia ... .. ½ dr.  
 Water ... .. 1 oz.

(B):  
 Nitric acid ... .. ½ dr.  
 Water ... .. 1 oz.

A freshly made solution being used for each negative. This is followed after washing by the application of a saturated solution of chrome alum.—WIZARD.

4584. **Silver Stained Negative.**—This has been asked many times, but the really effectual answer has yet to be evolved. You might be able to remove the marks by soaking in strong solution of hypo for some hours, or weak solution of cyanide of potassium, but as anything that removes the marks will also remove the image, it is obvious that nothing much can be done.—R. A. R. BENNETT.

4586. **Loan of Camera.**—"Prof" would find a very good half-plate Instantograph camera with R.R. lens at the following address: Coachman, The Lodge, Roby, Liverpool.—J. A. S.

4587. **Channel Islands.**—There are no restrictions whatever on photography. Ilford plates can be obtained at Arnold's, in the Arcade, Guernsey, and probably in Jersey also. Sark is a very paradise for the camera. I shall be glad to give further information if required. Editor has address.—H. N. MALAN.

4587. **Channel Islands.**—"Rivuli" will find no restrictions whatever; no custom-house searching either in Guernsey or Jersey. De Faye, photographic chemist, 21, David Place, St. Helier's, Jersey, has a large stock of plates, also dark-room.—J. F. LAURENS.

4587. **Channel Islands.**—I beg to inform "Rivuli" that there are no restrictions placed upon photography in the Channel Islands. Ilford plates may be obtained both in St. Helier's, Jersey, and in St. Peter's Port, Guernsey. If "Rivuli" should be in Guernsey at any time, I should be most happy to give him any particulars regarding the best spots to photograph.—SARNIA. (Address with Editor.)

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOTO.

**NOTE.**—In this column we cannot advise upon purchase of APPARATUS, PLATES, PAPER, or PHOTOGRAPHIC MATERIALS.

Advice will be given upon questions of "Photographic Procedure," negatives and prints will be criticised, and every help given to the worker in photography.

G. O. M.—There is no society at Barrow-in-Furness that we are aware of. Thanks for your high opinion of the AMATEUR PHOTOGRAPHER and our "Annual."

GEO. LAWLEY.—Any photographs that will come within the title are eligible. We have a special competition for "River Scenery," therefore views including river or running stream should be reserved.

EACILE.—Drunken architecture is never a fault of the lens, but is due to the camera not being held upright. The R.R. lens is more rapid than the single lens, the relative rapidity being R.R. = 1, single lens = ½; therefore the single lens is twice as slow as the R.R.

INTERNATIONAL.—The print you enclose is good both in tone and technical work, etc. Whether you would stand any chance in a competition depends greatly upon what other work is contributed. You can but try.

CARLSBAD.—Your camera should be quite satisfactory with the partition, which any camera maker would fit in for you. For the latter part of your query see note at head of this column.

GRAMMAR.—You have asked us a question which we cannot answer for the simple reason we do not know what distance you would have between object and lens, and, secondly, because we do not know how quickly your object would move, and, thirdly, because we do not know the focal length of your lens. You would be able to answer this query from the "Dictionary of Photography," pp. 121-122, second edition. If you like to send us the above data we will work out the calculations for you and let you know next week.

F. FIRST.—There is not the slightest difficulty in reducing from 5 by 4 negatives to lantern size, but the directions are rather too copious to give here. You would find full directions in the "Dictionary of Photography." The negative is placed against against the window or any source of light, and the lens is pointed at it and the focus and distances so adjusted that the image of the negative just fills a 3¼ square space marked on focussing screen.

J. ROBERTSHAW.—(1) Good, though slightly over-exposed; (2) Very hard, too much pyro in the developer; (3) A little stiff, but otherwise good; (4) Over-exposed and very poor; (5) Good; (6) Poor. ANAXAGORAS.—See note at the head of this column.

J. H. P.—There is no licence required for selling prints.

LINDUM.—Entered your name. We are glad you have derived benefit from it. We cannot suggest any remedy for your absence.

H. L. (Newcastle).—The only thing we can suggest is to make trials of different exposures and continue the development longer, with an increase of bromide towards the last. We will try if you like and see what we can do.

A. NOVICE.—It certainly is not worth while buying the instrument named. You may always accept the statement of the makers. The instrument is not absolutely reliable, but it is in such general use, one is compelled to stick to it.

C. W. F.—Your print is over-exposed, and consequently flat and wanting in pluck. It looks like a pretty spot, but we can hardly judge from the print.

W. DE M. PENNEFATHER.—Two of your slides were cracked when received. (1) A little too thin; (2) Good; (3) A little bit too hard; there's a good deal in the floor which might have been got out with a little longer exposure; (4) Over-exposed and poor; (5) Good; (6) Good; (7) Good, considering the difficulties under which you worked.

ROBY.—No. 1 would have stood more developing. Negatives 2 and 3 were smashed to atoms. The negative you sent last week of house was over-exposed and under-developed. "The Lady and her Cat" is slightly under-exposed and under-developed, and the lighting is very curious; had your sitter turned to the light, instead of away from it, very much better results would have been obtained.

A. E. CHAPMAN.—The negative you send is very fair, but would have stood a little longer exposure, and would have been better had you been a little further off and taken in the whole of the tree. The slide is very much over-exposed. We shall always be pleased to help you "potter" out your difficulties, and will help you still further if you send some prints for criticism.

CHARLES C. MACKLEY.—We had one of the tents built specially for our offices, and find it answers admirably for such work as we need.

W. W. GRATSCHEFF.—Your letter of acknowledgment duly received, for which many thanks.

F. H. RUELL.—We have your letter and draft. Will do as you desire.

JE KOOTIL.—Shall be much obliged if you will send us an account.

W. G. BARTON.—Delighted to hear from you, or advise upon any photographic matter.

H. PERCY HOLMES.—Will reply by post. Thanks for your kind remarks.

## Quarterly Examinations in Photography.

### QUESTIONS.

1. What is meant by "ripening" an emulsion? Give the different methods.
2. A plate has been specially coated with a film of emulsion  $\frac{1}{4}$  in. thick, and is exposed on a brilliantly lit object for one-tenth of a second, yet on development an image is seen on the back of the film. To what action would you ascribe this—the light not having been able to penetrate through the film—and state any other instances where such action may occur?
3. Write an answer to the letter of "E. A. D." on p. 224 AMATEUR PHOTOGRAPHER, March 27th, giving your experiences and opinion on the views there expressed.

(Latest Day for Answers—April 13th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
  2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
  3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.
  4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.
  5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.
- NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—  
"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, from April 8th, 1887, up to date, 208 numbers, all quite clean and whole; what offers?—J. Robertson, 24, Millgate, Arbroath.

**Bicycles.**—Cushion tyre Safety, just new, cost £14, balls everywhere; £7 10s.; approval.—7, Dereham Road, Norwich.

**Cameras, etc.**—Collins' pocket cameras, in cases, 5 by 4 and quarter-plate, each with six double backs, and fixed focus hand-cameras, working with above backs, all in good condition; no approval.—Mr. H. Miles, 19, Kensington Crescent, W.

Box camera, 12½ square; exchange half-plate wide-angle lens, shutter, or offers.—1A, Lower Hester Street, Northampton.

12 by 10 camera, all movements; £3 10s.; exchange half-plate camera, R.R. lens.—Tooth, Stephen Street, Rugby.

Camera, 7½ by 5, by Hare, London, equal to new, three slides, strong leather case, cost £12. What offers?—W. P. Pitts, 20, Abington Street, Northampton.

Short-focus camera, three double backs, two-fold stand, £3; four-drawer cabinet, containing 135 gull and wild bird eggs, exchange curiosities or sell.—Waters, 21, Westbourne Park Road, Bayswater.

**Cameras, Lenses, etc.**—Lancaster's half-plate Instantograph, lens and shutter, two slides; cost £4 12s.; price £3; as good as new.—Firth, Oakleigh House, Wakefield.

Ross' portable symmetrical lens, No. 3, in perfect condition, 42s.; Kershaw's shutter, 2½ in., 10s.; Beresford's whole-plate changing bag, new, 7s. 6d.; one Tylar's metal dark-slide, 10 by 8, new, 5s.; quarter-plate camera, and three dark-slides, rapid single lens, Greenall's shutter, and case, the lot 30s.—Guthrie, Bonnington, Edinburgh.

Lancaster's 1891 extra-special quarter-plate, combination Rectigraph lens, and double dark-slide, new last month; 75s.—Maltby, 267, St. Paul's Road, West Smithwick.

Whole-plate McKellen extension camera, with one double slide, and Eastman's roll-holder in case, together with Ross' 10 by 8 R.R. lens and Kershaw shutter; £14 10s.—Baird, 15, Lothian Street, Edinburgh.

Lancaster's quarter-plate Merveilleux camera, double dry slide, lens, and stand; price 14s.—L. Bagshaw, Union Street, Doncaster.

Whole-plate tourist camera, Billicliff's patent, very light, leather bellows, three double slides, £4 10s.; 8½ by 6½ Dallmeyer's R.R. lens and diaphragm, £5, or £9 for both; in perfect order; 10 by 8 R.R. lens and case, diaphragm in fine condition, 55s. cash; approx. on deposit. Address with Editor.

Quarter-plate mahogany bellows-body camera (by Copeland), rapid view lens, rack adjustment, double slide, and walking-stick tripod, 25s.—Cleminson, outfitter, Portsmouth.

Watson's half-plate Light Premier camera, three double dark slides, all brass bound, Ross's 8 by 5 symmetrical lens, solid leather case, with folding tripod, bought last year, cost £19, perfect condition, £12.—Mrs. Dowell, Larkhill Terrace, Blackburn.

Half-plate Instantograph, new last year, with combination Rectigraph and Becker's 7 by 5 R.R. lenses, Chronolux shutter, universal stand, three mahogany and nine Tylar's dark slides, and adaptor. What offers lot? Part exchange hand-camera. Particulars—Copeman, Henstridge.

Lancaster's whole-plate extra special patent camera, three double slides, all brass-bound with cases, three carriers, combination Rectigraph lens, sliding stand complete in bag, only used one season, excellent condition, cash offers?—Hugh Walton, Alston, Cumberland.

Lancaster's half-plate Instantograph, 50s.; finder,

3s. 6d.; 5 by 4 portrait lens (Stanley), 20s.—M. Whiteside, St. Nicholas, Cardiff.

Turnbull's Cyclists' camera, quarter-plate; Wray R.R. and Iris diaphragm, focussing screen and index of distances, six double slides, two finders, adjustable shutter, cost £7 last autumn, price £5; sent to Editor for report if desired.—Cecil Wood, Ilfracombe.

**Hand-Cameras, etc.**—No. 2 Demon, four plate bags, 7s. post free.—W. J. West, The Green, Gosport.

Hand-camera, Talmer, by Talbot and Bamer, carries twelve quarter-plates, fitted with rapid rectilinear lens and view finder, complete, quite new, a bargain, price only £2.—James Boyer, Homeleigh, Whitehall Road, Woodford Wells, Essex.

Detective camera, quarter-plate, almost new, perfect, leather outside; the lens and shutter specially made by Wray, price £4, cost £8.—Box 1, Mallow.

Griffith's Guinea detective camera, almost new, 12s. 6d.—Miss Amy Mercer, Pennington, Manchester.

Ideal hand-camera, 12 plates, quarter, cost £8 10s., perfect condition, nearly new, approval, deposit; £5 5s.; or exchange quarter-plate camera with R.R. and W.A. lenses.—Taylor, 28, Gauze Street, Paisley, N.B.

Griffith's hand-camera, three double slides, equal to new, 12s. 6d.; 5 by 4 rectilinear lens, splendid definition, 18s. 6d.; Greenhall's Lightning shutter, 4s.—J. Smith, Dalton, Rotherham.

**Lenses, etc.**—Great bargain, 7 by 5 rapid rectilinear lens, f/8, Waterhouse stops, as new, for 19s. 6d.—92, Slad Road, Stroud, Glos.

5 by 4 Wray R.R. with Iris, works f/5.6, Newman's shutter on hood, cost £4 5s. last autumn; £2 15s., or lens, £2 5s., shutter, 15s.—Cecil Wood, Ilfracombe.

Optimus rapid landscape lens, 5 by 4, works f/11, cost 25s., price 15s.—Cecil Wood, Ilfracombe.

5 by 4 portrait lens (by Stanley); price 30s.—F. W., 109, Senegal Road, South Bermondsey.

Optimus Euryscope, half-plate, works at f/6, quite new, and in perfect condition; £3 15s.—Cooper, Chesham, Stockport.

Optimus 7 by 5 R.R. lens; 35s.; approval; deposit.—O. Michelmores, Broadstone, Dartmouth.

**Sets.**—Will give Lancaster's half set, complete, extra slide and shutter, for Facile hand-camera, or Underwood's quarter set and cash.—Waddell, Malden Road, N.W.

**Sundries.**—For sale, two gas bags, oxygen and hydrogen, good condition.—Sayer, Irlam, Manchester.

Black spaniel, prize winner, splendid worker; will exchange for first-class quarter-plate hand-camera or cash offers.—Bowman, Oakwood, Hexham.

"Photographic Reporter," Nos. 11 to 26 inclusive, unbound, as new; cost 12s.; price 6s.; buyer pays carriage.—Cecil Allen, East Park House, Southampton.

Ashford's stand, 5 ft. with 6 in. top, three-fold, sliding adjustable legs, very firm stand, cost 25s., price 15s.—Cecil Wood, Ilfracombe.

## WANTED.

**Hand-Cameras, etc.**—Hand-camera, quarter-plate, reflecting or Talmer.—27, Chandos Road, Bristol.

Shew's half-plate Eclipse hand-camera, recent make, standard pattern, sound, complete, cheap approval.—Full detailed description and price to Knowles, Woodlands, Bolton.

**Lantern.**—Good magic lantern, single or binocular, for oil and lime-light, cheap.—Dicker, 7, St. Paul's Churchyard, E.C.

**Lens.**—Good cabinet portrait lens, Optimus preferred, in exchange for nearly new ladies' gold watch, valued £4.—Oox, Swanley.

**Set.**—Good quarter or half plate set, complete, cheap, Thornton-Pickard time and instantaneous shutter for half-plate, and case for half-plate camera.—Dicker, 7, St. Paul's Churchyard, E.C.

**Shutters.**—Thornton-Pickard shutter, for 1½ in. hood.—E. Steele, 10, Oakford Road, N.W.

Newman shutter, to fit 1½ in. hood.—R. T. Walker, Utoxeter.

**Sundries.**—Standard works on photography, send lists and prices; also 1 to 12 "Photographic Answers" and "Practical Photography."—A., 107, Broad Street, Birmingham.

## NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM.....	Six Months, 5s. 6d.....	Twelve Months, 10s. 10d.
POSTAL UNION .....	" " 6s. 6d.....	" " 13s. 0d.
INDIA, CHINA, ETC. ....	" " 7s. 6d.....	" " 15s. 3d.

## NOTICES AS TO ADDRESS.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LTD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

**ADVERTISING DEPARTMENT.**—All communications respecting TRADE Advertisements in the AMATEUR PHOTOGRAPHER are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—To ensure insertion, all Communications should reach the Editor on Tuesday.

No. 340. Vol. XIII.]

FRIDAY, APRIL 10, 1891.

[PRICE TWOPENCE.]

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.

OUR VIEWS.—Monthly Competition, No. 23, "Inland Scenery:" the awards—Lectures on Art, by Mr. Blanchard—The Camera Club Library—The *Weekly Scotsman* on Photographic Matters—Southport Social Photographic Club: Exhibition of Pictures, etc.—The Testing of Photographic Lenses at the Kew Observatory—Mr. Alex. Pitkethly, of Leith, is awarded a Silver Watch for a Letter upon Amateur Photography—Another Explosion of a Regulator in a Compressed Gas Cylinder—Quarterly Examinations: the Awards—Cardiff Photographic Exhibition—Brussels International Photographic Exhibition—The Croydon Camera Club Exhibition—The Camera Club Conference.

LEADER.—Home Portraiture.

EXHIBITION of Members' Pictures at the Camera Club.

LETTERS TO THE EDITOR.—Exposure v. Development (C. Hetherton Lewis, Eidsvoll)—Celluloid to Focus on (G. H. Verney)—National Photographic Exhibition (S. G. B. Wollaston)—Photography in Natural Colours (G. Lacy, Houston, S. Chamberlain, G. H. Verney)—Explosion of a Regulator on an Oxygen Gas Cylinder (H. D. Brandeth).

COMMUNICATED ARTICLES.—Composition, and Light and Shade (Robinson)—Amateur Photography (Pitkethly).

NOTES.—Edinburgh.

NOTES FOR NOVICES.—The Dark-Room.

APPARATUS—"Companion" Hand-Camera—The "Scotia" Camera.

EXHIBITIONS, ETC.—Liverpool (No. V.)—Camera Club Conference—Exhibition of Members' Pictures at the Camera Club.

THURSDAY EVENINGS AT THE CAMERA CLUB.

SOCIETIES' MEETINGS.—Bartow-in-Furness—Bedford—Birmingham—Bristol—Cornish—Croydon—Croydon-Micro.—Elizabethan—Faversham—Haltwhistle—Holborn—Ireland—Isle of Thanet—Leeds—Lewisham—Morley and District—North Middlesex—Photographic Society in Richmond—South London—Southport Social—Tunbridge Wells—Wakefield—Woolwich.

SOME eighty or more very admirable photographs have been entered for the AMATEUR PHOTOGRAPHER Monthly Competition No. 23, "Inland Scenery." The following awards have been made:—

### First Prize (Silver Medal).

A. T. NEWINGTON .. .. Ticehurst.

This competitor sends a charming picture, "Lovers' Walk, Dovedale, Derbyshire," which will be reproduced as the frontispiece to the May number of the *Photographic Reporter*. The picture is perfect in selection, composition, and balance; it is certainly one of the best we have yet had contributed to our monthly competitions; it was taken with a Dallmeyer's R.R. lens  $8\frac{1}{2}$  by  $6\frac{1}{2}$ , of 11 inch focus,  $f/24$ , with four seconds exposure of a Mawson and Swan's "Castle" plate,  $7\frac{1}{2}$  by 5, on the 11th September, in moderate light, at 2 p.m. The print is on Dr. Jacoby's chloride of silver emulsion paper squeegeed on to ground glass; a most perfect, soft, warm purple has been secured by toning with the sulphocyanide of ammonia bath.

### Second Prize (Bronze Medal).

ALFRED J. JEFFREYS .. .. Chelmsford.

The photograph sent in is a fine evening study, "An

Essex Country Road." It would, in our opinion, have been even a better picture had attention been given to the securing of more detail in the foreground. The print, sepia-type, somewhat clogs up the trees and foliage in the foreground, and we hope to show in collotype as good a print as the one sent to the competition; we have the negative, and find it to be an excellent one. The competitor says, "Exposed just after a storm, about 5.30 on a March evening." A Wray R.R. lens of 11 inch focus was used, and 10 secs. exposure given with  $f/22$  to an Ilford ordinary plate.

Other pictures which have special merit are "A Hampshire Home," Charles Blomley (Rochdale); "Greenwich Hospital," A. R. Berry (Brockley); "In Kew Gardens," A. James (Barry), a very well chosen point of view; "In Vizella," M. M. Lucio (Villa Nova de Gaia), a picture of considerable interest; "Broomhill Point, Derwentwater;" F. C. Worsley (Old Charlton), an admirable selection, but the introduction of cattle in the shallow water, or a boat in the middle distance would have helped the composition. There are many others which if space permitted we should like to mention, but they will all receive attention at our hands in the *Photographic Reporter*.

MANY of our readers will be interested to know that Mr. Valentine Blanchard will deliver a course of lectures at the Polytechnic, Regent-street, on "Art in Relation to Photography," which will be illustrated. The course commences on the 6th of May.

THE Secretary of the South London Photographic Society informs us that the Committee have decided to enforce an entrance fee of 2s. 6d., and that in future meetings will be held on the first and third Mondays in the month.

WE cannot refrain from complimenting the Hon. Librarian of the Camera Club, Mr. Lyonel Clark, upon the admirable catalogue of books and publications that are to be found in the Club's library. The members of the Club owe Mr. Clark much for the exertions that he has made to secure a thoroughly representative library; it is at present perhaps the best collection of books upon photography that exists, and Mr. Clark will not, we are sure, rest satisfied until it is complete. We would venture to suggest that those of our readers who could spare any standard works on photography could not do better than present them to the Camera Club, where they will be preserved for generations

yet unborn, and increase the usefulness of the library to the workers and thinkers of the present day.

THE *Weekly Scotsman* gives, in an article every Saturday under the heading "The Photo Club," interesting information, advice, and instruction upon photographic matters, conducted by a photographer. Last week the subjects were: "Photography as a Hobby; What it Costs;" "Apparatus;" "Photographic Society for Liberton," already referred to in these columns; "Slides wanted for Blantyre Mission, South Africa;" "The Development and Application of Photography," a lecture delivered last week by Mr. F. Dundas Todd; "Photographing the Heavens;" "Cloud Negatives;" "Leith Amateur Photographic Association;" "Edinburgh Photographic Society"—a sufficiently long list to show that the man on the *Weekly Scotsman* knows what is going on.

ON Wednesday, June 2nd, the members of the Southport Social Photographic Club propose to hold an exhibition of pictures and decorative transparencies at their meeting place, 15, Cambridge Arcade. The work is not to exceed whole-plate in size, and is to be entirely done by the exhibitor. There are to be three classes, and one prize given in each—for the best exhibit, for the best decorative transparency, and for the best instantaneous picture.

It will be remembered that some months since we drew attention to the work being done by the Superintendent of the Kew Observatory of the Royal Society to establish a Testing Department for Photographic Lenses. This department is now in working order, and anyone can have a lens tested under the following conditions, which have been supplied to us by Mr. G. M. Whipple, Superintendent of the Kew Observatory:—

1. The lenses are to be delivered either at the Kew Observatory, Richmond; or to the Secretary of the Horological Institute, Northampton Square, London, E.C.; or to Mr. R. Strachan, of the Meteorological Office, 63, Victoria Street, Westminster, S.W.

2. No certificate will be granted for a lens unless it bears a distinguishing number on its tube. The maker's name need not be engraved.

3. Lenses may be tested before they are fitted into cameras, provided they are numbered, and are accompanied by their flanged mounting. They cannot, however, be received for examination, if their diameters exceed 4 inches or the equivalent focus 30 inches.

4. The lenses are tested in sets, and the trials begin on or about the 1st and 15th of every month. Lenses intended to be submitted to such trials should be deposited either at the Observatory or at the receiving houses at least three days before either of those dates, accompanied by a duly attested form of entry, specifying the class of test to which the lens is to be subjected.

5. The fee for testing each lens is, for Class A 10s. 6d., Class B 2s. 6d. It will be payable when the lens is ready to be returned.

The Superintendent may decline, at his discretion, to receive any lens which he may consider unfitted for examination.

6. Duplicate certificates, with the customer's own name filled in, can be supplied to makers, at a charge of 1s. each. The original certificates must, however, be returned whenever an application is made for duplicates.

FOR CLASS A TEST.—Determination of the length of equivalent focus. Size of effective aperture with every stop in terms of focal length. Angle of field of view and size of plate effectively illuminated. Number of external reflecting surfaces. Coincidence of visual and chemical foci. Presence of flare spot. Workmanship of surfaces, structure and degree of transparency of glass. Centering in mount. Defining power. Relative quality of illumination in different parts of field. Amount of astigmatism or optical distortion.

FOR CLASS B TEST.—Determination of the length of equivalent focus. Size of effective aperture with largest stop. Angle of field of view. Size of plate effectively illuminated. Coincidence of visual and chemical foci.

Note.—All lenses certified at the Kew Observatory will be marked with the monogram "KO A or B and a registered number, unless the mounting is such that the operation of engraving cannot be performed with safety to the lens. An additional fee of 6d. will be charged for engraving the monogram and number.

Applications for forms for the entry of lenses for testing, and all other correspondence, should be addressed to the Superintendent, the Kew Observatory, Old Deer Park, Richmond, Surrey (Test Department).

THE Leith Amateur Photographic Association has always had prominent workers, and not one has been more active in advancing photography than the present Hon. Secretary, Mr. Alex. Pitkethly. This gentleman has just been awarded a prize silver watch for the best letter on "Amateur Photography" offered by the *People's Journal*, a paper with a circulation of over 250,000, and published in Dundee. The letter is interesting to amateurs and especially to beginners; we give the text in another column. Whilst congratulating Mr. Pitkethly on his success, we must also compliment the editor of the *People's Journal* on his enterprise and the assistance he has given to the advancement of amateur photography in Scotland.

On page 260 we have a correspondent's account of another of those mysterious explosions which seem inevitably associated with the use of compressed gases. They are mysterious because we have no satisfactory and conclusive evidence as to the cause. Of conjecture, however, there is plenty. In the case of an explosion of another regulator which took place a few months ago, it was suggested that a small particle of metal flying about loose in the chamber had become heated by the inrush of the oxygen, and thus ignited the gas. Some such explanation as this is certainly very plausible. An explosion which caused considerable conjecture, occurring some years back at the Laboratory of Agriculture, Paris—but in this case the gas was hydrogen—was explained in the same way. Probably in every case where one of these mysterious explosions occurs, the cause, if discovered, would be found to be partly due to the presence of atmospheric air, which may or may not—more probably may—contain fine dust or carbonaceous matter of some kind as an impurity, and the effect of powerfully compressing air is known to almost every school-boy who has ever listened to a lecture on heat, and witnessed the well-known experiment of firing a piece of tinder at the bottom of a cylinder, into which a piston fits very tightly. Now in the case in point we have probably a very good example of the formation of heat by compression; a small quantity of dust-laden air, a heavily compressed gas "repeatedly" turned on and off, and *voilà tout*—an explosion and a sudden burst of flame. Our correspondent has probably to be thankful that the bottle of gas was under heavy pressure, and pure, or otherwise a suck back of the flame might have had disastrous consequences. What may be the usual practice of professional lanternists we do not know, but we are always extremely careful to turn on the lantern-jet before turning on the oxygen at the bottle, which relieves the first great pressure.

THE result of our first "Quarterly Examination in Photography" is pretty close, and is as follows:—

- |                  |                 |
|------------------|-----------------|
| 1st. "Worfield," | with 306 marks. |
| 2nd. "Sunesis,"  | " 297 "         |
| 3rd. "C,"        | " 290 "         |

The order of the remaining competitors being "Development," "E. B.," "Lindum," "Electra," "R. C. M.," "Spain," "Biarritz," "A. C. S."

The fourth competitor ran very close for third place, and

the next four competitors were only a little way behind, and fairly close to one another. For the first prize we have decided to give photographic apparatus, materials, or books to the value of *two guineas*, the second prize to the value of *one guinea*—the third prize to the value of *half a guinea*. We shall be glad, therefore, if the successful competitors will kindly let us know what they would like, and we will forward to them what they select. Several of the competitors have expressed their satisfaction at this new departure, one competitor writing as follows: "I do not know whether it is necessary for me to express my wish to continue during the next quarter. Anyhow, I do so wish, and shall send answers next week. I may take this opportunity of saying how very valuable I think this examination is. It has stimulated me to work as nothing else could have done, and I am most sincerely grateful to the Editor of the AMATEUR PHOTOGRAPHER for having started these examinations." We hope that for the current quarter we shall have not only our old competitors, but new ones also, and we would again remind those desirous of competing that they must apply for registration, although such application may accompany the first lot of answers, which are due next Monday.

—♦♦♦♦—

We have just received the prospectus of the Cardiff Photographic Exhibition to be held from the 12th to 26th August, during the visit of the British Association to the city. The photographic society have already promoted two photographic exhibitions, which have been pronounced successes, and there is no doubt that under the able administration of the Exhibition Council even greater successes are in store. We note that the judges will be Messrs. Valentine Blanchard, Gambier Bolton, F.Z.S., and Mr. Paul Lange. Ten general classes are open to amateurs and professionals, including the champion class. Four classes are open only to amateur photographers viz.:—Class II., Portraiture; XII., Landscape or seascape; XIII., Genre; XIV., Landscape, 6½-plates. A special competition, open to photographic societies, under Class XV., is announced for the best collection of not less than fifty lantern-slides illustrating a town or district; prize, an optical lantern, value ten guineas. The slides to be accompanied by a lecture written or printed on cardboard. The winning slides to become the property of the Society. In all classes a silver and bronze medal and certificate is placed at the disposal of the judges. Entry forms and other particulars will be supplied upon application to the Hon. Secretaries, Messrs. G. H. Bedford and T. H. Faulks, 127, Bute Road, Cardiff. All exhibits must be delivered on or before the 7th of August.

—♦♦♦♦—

THE Secretary of the Brussels International Photographic Exhibition Committee, M. Ch. Puttemans, has favoured us with an advance proof of the prospectus of the Exhibition which is being promoted by the Belgian Association of Photography, and which will be under the patronage of His Majesty the King of the Belgians. The Exhibition is open to all comers, amateurs, professionals, and manufacturers of photographic apparatus. It is intended to open the Exhibition on the 20th of July, and it will remain open for some weeks. All frames, etc., must be received on or before the 10th of June, and earlier under certain conditions. The exhibits will be divided into seven classes. All "*works offered for exhibition will be submitted to a preliminary examination by a jury, to decide whether they shall be accepted or rejected.*" Class I. Negatives and positives on glass, ferrotypes, etc. II. Photographic prints, including enlargements. III. Photo-mechanical processes. IV. Application of photography to arts, science, education,

manufactures, etc. V. Photographic apparatus and materials applied to arts, scientific work, expeditions, educational or industrial purposes. VI. Photographic literature, works, and publications. VII. Publications illustrated by photo-mechanical processes. It is interesting to note the proposed constitution of the jury, viz.: (1) The President of the Belgian Association of Photography; (2) The Secretary; (3) Two members to be chosen by the Belgian exhibitors from the members of the Belgian Association; (4) Two members outside the Association, to be nominated by the Committee; (5) Five members to be nominated by foreign exhibitors, who will receive with their letter of admission a bulletin on which they are requested to write the names of five gentlemen of different nationality, who will be elected members of the jury by the majority of votes.

From the foregoing it will be seen that the Belgian Association are intending to do their best to secure a representative jury. There is little doubt that the Exhibition will be a pronounced success.

—♦♦♦♦—

SUPPLEMENTING our list of the awards given last week of prizes at the Croydon Camera Club Exhibition we note that the first prize for lantern-slides was awarded to Mr. C. F. Oakley, Mr. Hirst being commended. The judge was Mr. Charles Hussey, and he spoke very highly of the slides submitted for competition. In consequence of an error on the part of the executive, the wrong picture was awarded the AMATEUR PHOTOGRAPHER Bronze Medal. The mistake has since been rectified. Mr. A. J. Sargeant takes the Bronze Medal, and Messrs. Elliot and Whitaker tie for the certificate. As a consequence we shall have pleasure in giving two certificates.

—♦♦♦♦—

THE fifth annual Conference of the Camera Club has been held this week. The arrangements have been carefully made, and the Committee must again congratulate themselves upon the large number of members and friends who have attended the meetings. On Monday evening, we understand, the large room at the Club held an audience of some 200 or more who assembled to hear the items on the programme of the musical evening. On Tuesday the Conference opened at the Society of Arts under the able presidency of Captain W. de W. Abney, C.B., D.C.L., R.E., F.R.S., who referred to matters of general interest in his short address, giving particulars of an interview he had a week or so since with M. Lippmann and describing at some length the work done by that gentleman in connection with photography in colours. The paper which created most discussion was that contributed by Mr. Joseph Pennell on "Photography as a Hindrance and a Help to Art," which in the absence of the author was read by Major J. F. Nott. Mr. Lionel Clark discoursed upon "The Use of Uncorrected Lenses," calling attention to experiments that he had made with spectacle or periscopic lenses, and showing negatives taken with such lenses. The paper by the Rev. F. C. Lambert, M.A., "A Note on the Physiological Aspect of some Problems in Art," was taken as read. In the evening a selection of lantern slides by members and others were shown to a very crowded audience in the Theatre of the Society of Arts. The remaining papers were read on Wednesday from 2 to 5.30 p.m. The members and friends dined together at the Criterion Restaurant. In another column we comment upon the photographs exhibited in the club-rooms by members, and also give a short report of Tuesday's proceedings.

## HOME PORTRAITURE.

IN attempting portraiture in rooms not specially built for that purpose, the great difficulty to contend with is want of light, and power to control what light there is. The light streaming in from a narrow window which has not always an uninterrupted view of the sky gives a somewhat bright illumination to one side of a sitter's face, and the other is in somewhat dark shadow, and as the shadow side of the face is illuminated by light reflected from surrounding objects, such as dark-coloured furniture, or frequently somewhat yellowish paper, etc., the sensitive salt of silver in our dry plate has a tendency to exaggerate this shadow, and without an inordinately long exposure we get "soot and whitewash" results, or, in other words, one side of the face bare glass without any detail, and the other side very dense, so that to obtain the detail in the latter in the print we over-expose the former, and the print is too harsh. To modify this state of things must be our great endeavour, and we shall see how to do this in lighting, or rather placing of sitter, and also by the use of reflectors. Now, reflectors may be of too kinds, which we may call the small and intense, such as a mirror, and the large and diffused, like a sheet; the latter will be found of far greater service than the former, and to be of service must be of large size and properly placed; of sufficiently large size to be placed not only on some support, but also to be spread out on the floor. A convenient support for this reflector is the domestic clothes-horse. We may as well digress here a moment, and give one hint to all would-be home portraitists, and that is, make friends with the ruling spirit of the house, whether wife, mother, or sister, as to turn out decent work means some upsetting of the room and utilisation of household property; so first of all get on the right side of the powers that be, and secondly always clear up after you, put things back, as far as lies in your power, in the position you found them. Ladies will always look with disfavour on anyone who turns the place upside down, and even when "you men" put curtains, chairs, etc., to rights, the gentle hand must give the final arranging artistic touch.

Curtains are sure to drape the window, so these must be pulled right back, and pinned or held back by a chair, etc.; blinds, venetian or otherwise, must be pulled right up; and finally, windows must be clean—a dirty window will stop out 50 per cent. of the light sometimes. If the windows are of the French fashion, that is opening out or in like a door, open them wide, if not too cold. Finally, when necessary, use a reflector outside the window—we all know how snow on the ground lights up the room, so use a reflector, and use a big one; we daren't suggest putting a sheet out, because this might get us into serious trouble with the ladies, but "we are free to confess" that we do it, though under protest from somebody.

Our notes have hitherto had special reference to head or bust portrait work. When it comes to full-length, we get another question to consider, that of suitable accessories, and when considering the subject of posing, we shall note a point or two which may be useful, as very fine results may be obtained by taking a portrait of anybody engaged at work, or seated by the fire, or reading, writing, etc., and in such cases the picture would be incomplete without the actual and necessary furniture in the room, and in this case too we may admit the otherwise inadmissible wall paper.

Without going to any outlay, a capital background, especially for children, is the screen to be found in so many houses, and the same may also serve for the support of a ready-made background which may be found in every house, namely, a blanket; or the screen may be used to support the reflector.

## Letters to the Editor.

## EXPOSURE v. DEVELOPMENT.

SIR,—The letter which appeared in your issue of March 27th, upon the hydroquinone developer has naturally interested me as a worker of this chemical for the last six years or more. I can endorse the opinion that a strong solution is not the best to employ for bromide paper, as it certainly has a tendency to make the picture coarse. Moreover, there is the important consideration to bear in mind, that the hydroquinone developer has a more energetic action when air is allowed to come in contact with the film during the progress of development. There should, on this account, be a plentiful supply of the solution over the film.

The letter of Messrs. Hurter and Driffield evidently gives the convictions to which their interesting experiments have led them; at the same time, many of us would be interested to learn if all their plates were developed with the ferrous oxalate developer. Certainly that developer has the name for allowing the least so-called "latitude in exposure," and the conclusions drawn from the sole use of ferrous oxalate might be different to those arrived at with some other developing agent. I quite agree that the best results are obtained by correct exposure. But we must first decide what correct exposure really is. For instance, a certain duration of exposure will give a perfect negative with a definite developer—that is to say, a developer compounded in certain proportions—but if we were to vary the proportion of the chemicals in the developer, we should by no means secure the same result in the negative with the same exposure. It would seem from Messrs. Hurter and Driffield's experiments that a developer is used of unvarying proportions and the exposures regulated from that stand-point.

I can agree with them that if the light has had insufficient time to impress the plate it will be impossible to get an image, no matter what the developer may be; but on the other hand I am not clear that I comprehend their meaning in the expression "that nothing you could have done in development, or can do subsequently, will remedy a false relationship in the gradations established by the light alone." At any rate, to take a case from my note-book, I exposed two plates, one directly after the other, giving them the same time in exposing, on an out-door view. On developing the first, with my standard hydroquinone solution, I find the plate has had double the necessary exposure. Taking now the second plate, and altering the proportions of the ingredients in the developer, we find on finishing developing, that we have a good printing negative, and without any sign of having been over-exposed. I have several such pairs of negatives, and whilst one shows complete over-exposure, the other is quite satisfactory. This being so, it does not appear to me that any false gradation is apparent, and as long as we can secure a good print from any negative I do not see what more is required.

I must ask your correspondents to excuse me if I have not understood their statements, as I fear I may not have done, for they also indicate that intensification is a failure. There are many of us, I think, who have managed to get a good print after intensification, that would not yield a decent print before. Thus, even if the gradations are not altered, we do, nevertheless, secure what we seek; so perhaps some further information as to the matter may help to make the statements better understood, and as the subject is an important and interesting one, no doubt others will offer their experiences.

There is one remark in the letter of your correspondents that would be desirable to explain; I refer to the suggestion as to quality in plates (which I thoroughly endorse), and the consequent capacity for an amount of latitude in exposure. What, therefore, is the latitude that is considered will enable one to obtain good results?

I think Mr. Stanley C. Bright is fairly on the right track. — I am, etc.,

April 6th, 1891.

C. HETHTON LEWIS.

SIR,—I have read the letter of Messrs. Hurter and Driffield your last issue with much astonishment. The assertions that errors in exposure cannot be modified in development, and that an over-exposed plate remains an over-exposed plate and *ergo* practically a failure, are so completely opposed to my own experience that I beg to be allowed a few words in reply. The

baneful influence of such teaching is more likely to result in many beginners placing their cameras either on the shelf or in your sale column than anything else. A very large number of failures are undoubtedly to be attributed to the craze for that almost automatic simplicity in development, the one-solution developer. I would advise "E. A. D.," however, to take courage and persevere, and remember that a ready-mixed developer consists of developer, accelerator, and restrainer, and these must be modified more or less according to subject and exposure, the first named giving density, the second detail, and the last preventing fog and sufficiently retarding development to enable printing density to be obtained, some plates requiring more restrainer than others. From this it will be at once evident to the simplest mind that in the case of over-exposure the mere addition of water is not what is required to produce a successful result, but increase the first and third according to the amount of over-exposure; by adding water you are *reducing* the strength of the first and third, instead of *increasing* them at you ought to do. I should strongly advise "E. A. D." not to use ferrous oxalate for outdoor work, on account of its allowing but little latitude in exposure compared to pyro or hydrokinone, but preferably the former of the two, which in my hands I find produces the best average results. The great thing is sufficient exposure; under-exposure is hopeless, but a much over-exposed plate can generally be brought up to a fairly decent negative by judicious development. The coolness with which these gentlemen throw overboard, according to their own admission, the great authorities on development, is really charming; perhaps they will kindly tell us, as the great authorities are so untrustworthy, whose teaching among the smaller lights it would be safe for a beginner to follow.—Yours truly,

April 4th, 1891.

EDYLLION.

\* \* \* \*

#### CELLULOID TO FOCUS ON.

SIR,—I have just fitted to my 12 by 10 camera a piece of England's celluloid film, non-sensitised. Apparently it succeeds perfectly, and is a more perfect texture for focussing on than ground-glass. I shall give it a month's trial at Aix-les-Bains. In travelling, my ground-glass is constantly getting broken. I trust I have found a remedy.—Yours faithfully,

April 6th, 1891.

GEO. H. VERNEY (Lieut.-Col.)

\* \* \* \*

#### NATIONAL PHOTOGRAPHIC EXHIBITION, APRIL, 1891.

SIR,—Owing to the decision of the Liverpool Photographic Exhibition Committee to keep their exhibition open until the 11th inst., and as many of their exhibits are entered for the Crystal Palace, I beg to inform you that it will be impossible for the judging here to take place before Thursday, April 16th.—Yours faithfully,

S. G. BUCHANAN WOLLASTON.

Crystal Palace, S.E., April 6th, 1891.

\* \* \* \*

#### PHOTOGRAPHY IN NATURAL COLOURS.

SIR,—It appears to me that the difference between "Farbenlehre" and myself is not so much, is photography in natural colours possible? as, what is photography? I may be a little hypercritical on this point. For instance, if you take a negative and retouch it until there is as much pencil-mark as anything else, I do not call the result photography; or if you take paint, or any chemical substance, and daub it all over a platinum or bromide print, I do not call the result a photograph. In like manner, if you cunningly prepare a plate in different thicknesses of silver salt, and then place it in a dark-room and direct a tiny ray of light, passed through a prism, and filtered through coloured glass, in such a way that each of the component rays falls on the portion of the plate specially prepared for it, I do not for the life of me see how the result can in any sense be called a photograph. Or even if the film is homogeneous, and the varying thicknesses are produced by the chemical action of the component parts of the ray admitted one at a time, or by the subsequent action of the developer, still I cannot see where the photography comes in. You will observe that I am admitting that the results claimed have actually been obtained, though the evidence of this is very slight indeed. But photography, that is to say the photography that can make a representation of external phenomena, depends entirely on actinism, or on the relative intensity of the light reflected from the various portions of the scene. But colour is not actinism at all, although it affects the actinic force of light, as

humidity does, and it is just as reasonable to expect it to appear on the plate as to expect the various degrees of solidity to appear. To photograph a colour is to photograph a property, and if it can be photographed, then any other property of a thing which possesses chemical action can also be photographed, such as its relative degree of heat or cold. Light and dark, on the other hand, are not properties, but merely reflections from something else, and these reflections it is that are really photographed, not the thing or its properties.

Casati bases his statement on the best possible grounds, viz., that the language of the natives in question, though very comprehensive and complete, has no words for any other colours than white, black, and red. I have sold coloured beads and blankets to all the tribes of natives between the Victorian Falls of the Zambesi, and the Orange River, and Natal, and I know that these tribes have words for a great many colours.

I do not wish to be uncivil, but I am afraid that I must inform your correspondent that he is very much at sea as to the meaning of philosophical terms. Subjectivity has but one meaning, and that a very strict and exact one. It implies the non-existence of the phenomenon outside of the subject. If the distinction between subject and object is not sharply defined, all philosophy becomes impossible, unless the words are used in the Hegelian sense of the identity of opposites, wherein the only existence is in the union or relation of two opposites. The sentence "The subjectivity of a phenomena has no existence outside the object," has no conceivable meaning. Even if the word object is a misprint for subject, it still has no meaning, for it is the phenomenon, not its subjectivity, that has no existence. Again, the sentence, "It cannot be impossible to so arrange noumena as to present precisely the same subjective phenomena," has no meaning. The noumenon is the essence, the soul, the *ding an sich*, of which the phenomenon is the objective manifestation. Finite beings cannot, in the nature of finity, attain to a knowledge of things in themselves, and cannot therefore arrange noumena, or take any other cognizance of them.

#### EXPOSURE 2. DEVELOPMENT.

I notice a letter from Messrs. Hurter and Driffield, in which they say that an over-exposed plate must always remain an over-exposed plate. Surely they cannot have experimented much. I possess a negative on the fastest plate in the market, Paget xxxxx., which was exposed on a fairly open view with an R.R. lens stopped down to *f*/32 in a bright sunshine at noon on a May day for ninety seconds, and it makes a very good print. Another, precisely the same, exposed at the same time for thirty seconds, is absolutely the best negative in my possession. If I had them here I would send you prints. The secret is to soak in plain pyro solution for a few minutes before commencing the development.—Yours, etc.,

G. LACY.

SIR,—The following is weighty evidence in support of Mr. Lacy's view of the subject:—

In a lecture which Prof. Du Bois-Reymond lately delivered at the Berlin Academy of Sciences on "Science and Art," this celebrated physiologist says: "As for photography in natural colours, which both artists and amateurs are always dreaming about, we must confess that there is practically nothing to be expected in this direction. It is almost impossible that experiment should ever prove the theoretical reasons for this conviction to be false, so that the problem remains insoluble both in the immediate and in the most distant future."—Yours truly,

Vienna, March 29th, 1891.

HOUSTON S. CHAMBERLAIN.

SIR,—I am frequently asked, "Have you heard that photographs can be done in natural colours?" My reply is, "Certainly; I have heard it any time during the last thirty-five years." I am as old a photographer as "An Old Parliamentary Hand," Surg-Major Mantell, but I should be very sorry to jump to the conclusion he does, that photographs will never be taken in natural colours, nor am I one of those "who love controversy for its own sake." Can Surg-Major Mantell recall the time thirty-five years ago, when, before collodion came into general use, both he and I and many others were working with waxed sensitised paper and developing with gallic acid, and vacillating between this process and the positives on glass. Can the photography of the past compare with the magnificent results of the present; and who shall say what the development of photography will be thirty-five years hence, with the possible result that some mechanical

means will be devised making photography in colours as easy as our present black and white art? Are not the scientific marvels of the present age, such as speaking between London and Paris, and perhaps before long between London and New York, sufficiently startling to make it impossible for any human being to prophecy what will be the marvels of the next century. And most certainly photography in natural colours may be one of them; and when the back numbers of the AMATEUR PHOTOGRAPHER are eagerly perused by the photographers of say 1950, then and then only will it be decided who was on the "winning side."—Your obedient servant,

GEO. H. VERNEY (Lt.-Col.)

April 3rd, 1891.

\* \* \* \*

#### EXPLOSION OF A REGULATOR ON AN OXYGEN GAS CYLINDER.

SIR,—Could you or any of your correspondents explain the following? On Saturday evening, March 28th, while getting my lantern ready for exhibition, I had attached the tubing to the oxygen cylinder, but found it was leaking at the coupling. I had to readjust this several times, and, of course, each time turning on and off the gas. The last time I turned it on, the regulator, which was of the bellows pattern, or exactly like an oxygen bag, exploded with a very loud report equal to a four bore gun, accompanied with a flash of light at least fifteen inches in diameter. Naturally I jumped back several feet, but at once turned off the gas, but in the few seconds of time a portion of

the metal was fused (I send the regulator for your inspection). Now, there was no light nearer than the gas light in the hall, ten feet off, and we know oxygen is not inflammable of itself, nor was the hydrogen turned on, so what could have caused the explosion with combustion? No doubt pressure would have caused the collapse of the regulator, but whence the fire unless there was friction caused by expansion and some sparks thus generated? The fire must have come from within, as you will observe that the hole is burned from within to without.—Yours truly,

April 2nd, 1891.

HENRY D. BRANDRETH.

NOTE.—We refer to this matter in "Our Views." The illustration is from a negative taken by ourselves. We shall be pleased to show the regulator to callers on Monday next.—Ed. AM: PHOT:

**A Substitute for Gutta-Percha.**—Senhor da Costa, a Portuguese scientist, is reported to have discovered an excellent and widely-distributed substitute for gutta-percha. It is the solidified juice or sap which flows from the nivol-cantern, a shrub used in the Concan district of British India for making hedges. Senhor da Costa states that it is insoluble in water, softens with heat, and becomes hard again when cooled. It can be readily moulded into any shape or can be cast into very thin sheets, and can also be used for taking sharp and minute impressions. Like true gutta-percha, it is white when it issues from the tree, turning chocolate colour on drying.

## Exhibition of Members' Pictures at the Camera Club.

THE first exhibition of pictures in the new rooms of the Camera Club was opened on Monday, and if there may be, perhaps, some faults to find and some aspirations unfulfilled, on the whole the exhibition may be considered to be satisfactory. As a gallery for exhibition it can scarcely be said that the large room at the Club is well suited for the purpose. The hanging space is not large, though large enough for the number of exhibits this year; the light is very far from good, the cross lighting by day being, on one long wall at least, extremely aggravating, and not sufficiently strong and concentrated by night. A system of screens at right angles to the windows would, we think, be advisable, and large numbers of the smaller pictures could be advantageously displayed if the Club were to furnish a certain number of the very convenient shutter frames similar to those used at the South Kensington Museum, which are either hung round standing pillars or pedestals or affixed to the walls.

This year's exhibition is by no means a large or a representative one. Amongst the most important pictures are many which we have seen before, either at Pall Mall or published in one form or another. Many prominent members, such as Messrs. Austin, Clark, Gale, Cembrano, Wilson Noble, Rev. F. C. Lambert, and Captain Abney, do not exhibit at all, and Mr. H. P. Robinson, Mr. Wellington, and Mr. Wilkinson show but two pictures apiece. The time of year will no doubt in some measure account for this; last year's work being known and this year's scarcely begun yet; at the same time, some of the best work may have been sent to Vienna. It is curious to observe that although the Camera Club does not pretend to be solely an artistic club, but to include science also amongst its pursuits and workers, technical science is here represented by a solitary frame of Mr. Andrew Pringle's pet microbes. This condition of affairs may, however, be said to be chronic, and is not confined to the Camera Club. In the opposite direction the Photographic Society of Great Britain, which considers itself to be distinctly a scientific society, takes art under its wing in a supplementary manner only; yet what do we find at their annual exhibition? Everything in the direction of picture-making and the science exhibits almost *nil*. We must conclude, then, that the members of the Camera Club do not sufficiently interest themselves in any of the very many ways in which photography is applied to the sciences, or in the numerous and beautiful methods of photogravure, or in portraiture to any great extent. The work seems almost exclusively limited to landscapes, more or less tempered by figures, accidental or otherwise.

With regard to the quality of work exhibited, we feel bound to say that, considering the amount of tall talk indulged in since last autumn, which must have implied a corresponding amount of study and experience, the results are not commensurate with our expectations. We have a right to see within a reasonable time some proofs of the possibilities and capabilities of photography so much talked about by admirers of the new school; but that time has not yet, it would appear arrived, at least, as regards the Camera Club. With the exception of a few of the pictures which have already been exhibited elsewhere, there is here scarcely anything above the average; it would be unkind, of course, to be precise with regard to what is below. Still, we cannot help wishing, in the first place, that there were not so many abstentions amongst prominent workers, and next, that the new-comers of merit should be more numerous.

The phrase concerning the comparative absence of albumenized paper is becoming almost a stock one now in our reports of exhibitions, and the present exhibition is no exception to the rule. There is, on the other hand, a considerable variety of printing papers fairly well represented. The roughest sepia platinum, Fry's rough bromide paper, carbon, Scholz's rough paper, home-sensitised silver papers, toned with platinum, and matt-surface gelatino-chloride; all have their admirers. On the whole, it is evident that the extra rough surface papers receive from the hands of many workers careful attention; in other hands their use, it is probable, will be limited, and is scarcely to be recommended.

It will be hardly possible within the limits of a short article to

deal more than generally with a few of the more prominent pictures; for the rest, also, at the time we are writing the walls are, we are told, not yet filled up, and titles and names are still wanting.

The Honorary Secretary, Mr. George Davison, exhibits several pictures which have previously been exhibited at the Club and at Pall Mall, and we cannot say that the selection is by any means a fair sample of his best work. There is, however, a very effective small picture of some marsh land with a clever evening sky, and another which is in many ways a charming composition of a swift flowing river running under a picturesque old bridge, with a countryman who has taken his horse in it to drink. Possibly a captious critic might find fault with the lighting or with the figures, but there is too much that is good in the picture to tempt us to assume such an unenviable role. Mr. Henry Stevens' well-executed large flower subjects are well known, admirable as is the technique in every way; and so again are his home pictures with his *model* dog. He shows, also, some large transparencies, and no one could show better. Mr. Maskell's two pinhole landscapes on extra rough paper are striking examples of his method of working; in the left-hand one, with the reeds and rushes in the foreground, the clouding is a little too pronounced, considering the tone of the water, but this is possibly a slight error in the particular print. Both are certainly pictures which will attract attention. He exhibits also four or five others, mostly of strong sunshine and mist combined, in which the landscape and atmospheric effects atone for what faults we might be inclined to find with the figures.

Mr. Topham's long panoramic views of Alpine scenery show, we cannot help thinking, faults of carelessness, both in the joining and in the unequal colour of adjoining sections, which ought to have been avoided.

It is sufficient to mention Mr. Wellington's beautiful "Even-tide," as it is well known. His other picture, an enlargement, with sheep, is decidedly inferior.

We naturally expect a good picture from Mr. H. P. Robinson, and we get it. It is sufficient to say that it is thoroughly obinsonian, minute in detail, and clever in composition.

Mr. Gambier Bolton exhibits his famous kittens and his bulldog. He is a master in this line, and in saying this we say all that need be said.

Mr. Horsley Hinton's two large pictures are so good that they are sure to attract attention: at the same time the coast scene with figures is, we venture to think, absolutely spoilt by the obtrusive and falsely lighted sky. In the other the luminosity in the shadows is to some extent remarkable, but the sky, again, might be improved. Altogether, however, it is a good picture, and a word may be said for the printing method, which is silver on extra rough paper toned with platinum.

Mr. Thorncroft exhibits two frames with prints on extra rough paper of a curious blue colour; we are unaware what the process may be.

Mr. Gibson's church interiors are good technically, but hardly of general interest. From a pictorial point of view these subjects have never yet, we think, been satisfactorily rendered.

A word for Mr. Bright's comic little Diogenes in his tub (a tiny little picture in the corner near the entrance), and we think we have said nearly all that our space can afford to be said concerning this exhibition, which, on the whole, is one upon which the Club is entitled to congratulate its members.

The Club is to be congratulated on possessing amongst its members an artist of such talent as Mr. Burchett. The two charming figure subjects exhibited by him are admirable examples of what artistic photography can produce. We have no hesitation in saying that, in their way, they are as fine as anything that has yet been done. The "Belle Bretonne" is a graceful, simple figure of a girl admirably posed, with no suggestion whatever of the dressed-up model. It might be hypercritical to ask the question, but still—is she Bretonne or might we find her in London, an innocent English maiden? The other picture is a portrait, an English gentleman clad (and why not?) in a fine suit of sixteenth century etched German armour. We recommend both these pictures to the attention of the professional portrait photographer and retoucher. What retouching they have received has not been overdone; it is artistic and entirely different from the stereotyped professional method, the modelling not destroyed or obliterated, or falsely lighted, as is too often the case—in short, it has been done by a true artist hand.

## Thursday Evenings at the Camera Club.

(BY ONE OF OUR STAFF.)

SIR GEORGE PRESCOTT presided at the meeting of the Club on Thursday, when Mr. Sturmev gave an interesting lecture, illustrated by numerous lantern slides, descriptive of his trip to Norway with the Vesey Club. The negatives from which the slides were made were taken in a hand-camera, and Mr. Sturmev advised the taking of a wide-angle lens, without which he believed it was often impossible to give an adequate idea of the grandeur of the scenery. The light he considered to be twice as quick as that in England.

The Chairman said he had been to Norway a considerable number of times, and the route he should recommend would be by steamer from Hull to Trondjeim, and thence to Christiana. Norway was a splendid place for a three or four weeks' holiday, and the best time to go was in June or July. The visitor to Norway should also be careful to provide himself with a gimlet and mosquito net.

Mr. Sturmev said it was very wet during his visit, and the mosquito net was not necessary.

The Chairman pointed out that mosquitoes were most troublesome inland; the salt water seemed to keep them away from the coast.

Mr. Sturmev said it was well to go on the visit as early as possible, as in July and August the country was overrun with tourists, accommodation was difficult to get, and the roads were an inch or two deep in dust.

Major Nott protested against the advice to use a wide-angle lens, which he believed was the cause of much of the adverse criticism made by artists upon photography. The wide-angle lens would not give an effect of grandeur, and it was far better to get in that part of a view which the eye could see, and trust to the dimensions given in that portion to convey the idea of the grandeur of the scenery.

Mr. Sturmev demurred to the idea that he had recommended the use of a wide-angle lens only, but in many cases it was impossible to get sufficiently far back to get in more than a small bit of the side of a mountain, which conveyed no idea at all. This was specially the case in the fjords.

Mr. Davison remarked that it must be well known by those who used the wide-angle lens occasionally that it would so misrepresent a place that people who had been to the place frequently would utterly fail to recognise it.

The proceedings terminated with the usual votes of thanks.

"Adams and Co.'s Photographic Annual, 1891."—This book is issued annually, and in sending it to us Messrs. Adams say "that the first edition of 5,000 has cost us a fraction over 2s. per copy. \* \* \* Will you kindly state that the sale price is 9d. post free."

From this it will be seen that Messrs. Adams and Co. are dealing liberally with their customers. The first use of their "Annual" is to give to the photographic world their catalogue and price list, which is most complete and admirably arranged. Messrs. Adams are dealers, and stock almost every maker's goods; they have now in their new show-rooms such opportunities of showing goods that buyers can make, with the aid of the "Annual," their list out, and call and see the goods under the best advantage. In many things the prices are cut very fine; for instance, many photographic publications are sold at a discount, and almost all are kept in stock. The second use of the "Annual" is to give to those who are fond of photographic literature some capital articles which have been contributed by Capt. Abney, Major Nott, Professor Burton, Messrs. H. P. Robinson, W. J. Harrison, A. Pringle, W. D. Welford, Chapman Jones, F. Howson, H. Snowden Ward, Lyonel Clark, E. A. Gollidge, A. S. Newman, B. F. Wilkes, E. J. Wall, W. Wilkes, W. Birt-Acres, and George Davison. All these gentlemen are well known, and something may be learned from every article. The hints on the lens, the dark-room, exposure, developers, intensifying and reducing, silver printing, instructions, formulae, &c., are all arranged by "one who knows." Perhaps from Messrs. Adams and Co.'s point of view the feature, certainly the novelty, is to be found in the portraits of several editors of photographic journals who have lent their counterfeit presentments to embellish Adams and Co.'s Photographic Annual for 1891. The book is on sale either at 81, Aldersgate-street, E.C., or 26, Charing Cross-road, or it will be sent, as before mentioned, by post for the "nimble ninepence."

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER VIII.

*Fig. 15.*—As this composition consists of a single figure, I shall notice here the method Metzú has taken to render it a part of the whole, especially as we shall have to refer to other plates, when we come to treat of light and shade, and

FIG. 15.—METZU.

colour. The figure is dressed in black and white coming in contact and contrast in the strongest manner; the black is repeated by the hat, and diffused by the black marble in the floor, the white is referred to the white marble in the floor and collected into a mass by the white wall; the carpet, which is of red and warm colours, focussed at the light by a stick of wax, is repeated by the back of the chair, and carried up by the outside of the window on the edge of the picture, which is painted of a pale red; the forms are echoed and repeated with the same simplicity, and the picture frame on the wall, from being smaller than the frame of the window, serves at the same time to assist the perspective effect: even the fastening of the casement is not without its use in the composition. In thus obliging a design to depend on its ground for support, consists the principle of union and harmony; but, as I have at present only to draw the student's attention to the arrangement of form and that portion of composition that arises from the repetition and connection of lines, I shall notice one good plan amongst many others, which is, to mark in strongly those points in the ground which of necessity must be introduced from

natural circumstances, at the same time contriving the group so that those points become of the greatest consequence to the composition. This often gives a characteristic stamp of nature to the whole.

*Fig. 16.*—We have here the strong dark point coming in contact with the light ground in the most cutting manner, which is more naturally accounted for by its being the most projecting; as it is the inside of an empty drinking cup, it perhaps indicates the commencement of the story as well as any other means.

*Fig. 17.*—Ostade's pictures have the peculiarly valuable property of looking well at a distance, thereby attracting the attention of the spectator towards them. When we come nigh to examine, we find that this is produced by their possessing a decided mass of light, obtained by means of a light wall, sky, etc. His heads and hands form a number of luminous spots in a mass of half tint, and are rendered of more value by the introduction of blue and dark draperies; this requires much consideration, in order that those spots may take agreeable and decided forms to prevent confusion. In Ostade's works it is rendered the more easy, as he has seldom any particular story to interfere with the arrangement. His pictures call to my mind a passage in Hervey, which appears like the language of a painter, so completely consonant is it to the principles on which he constructs his work. Speaking of the stars, Hervey says, "On a careless inspection, you perceive no accuracy or uniformity in the position of the heavenly bodies, they appear like an illu-

FIG. 16.—REMBRANDT

FIG. 17.—A. OSTADE.

trious chaos, a promiscuous heap of shining globes, neither ranked in order nor moving by line; but what seems confusion is all regularity; what carries a show of negligence is really the result of the most masterly contrivance."

Unity is one of the essential elements of good composition. Fig. 15 is an example of how very small things unite to produce harmony. As we shall have further opportunities of studying this part of our subject when we come to *Light and Shade*, we will leave it for a time. Figs. 16 and 17 also require no further comment, except it may, perhaps, be pointed out that they are ignoble subjects redeemed by art. They are both examples of pyramidal composition, and strong insistence is shown in the value of balance, in the cup in the one sketch, and the pig and basket in the other.

(To be continued.)

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

THE sixth monthly meeting of the Edinburgh Photographic Society for the present session, held on Wednesday, 1st inst., and presided over by Mr. W. T. Bashford, Portobello, one of the Vice-Presidents of the Society, was devoted to a lantern exhibition by Professor Hunter, Edinburgh, of photo-micrographs of yeast and allied organisms, bacteria, etc. The Professor, who is an expert scientist and a very fair photographer, gave a most full description of the slides he showed, which were about sixty in number. He had, he said, no intention to go into the subject scientifically, but merely to show the characteristics of yeast and of a few of the bacteria which have been studied in man and the lower animals. Nevertheless, he crammed as much scientific information into his remarks as it has ever been the lot of almost any of the members to hear in the same space of time. The first slides were pen and ink sketches, which were good so far as outline was concerned, but when he came to slides prepared from photographs, everyone at once saw the great superiority of the latter, every detail in the formations being apparent. It was instructive to see the different forms which the yeast particles take in the various forms of that commodity, such as brewers' and bakers' yeast. Specimens of the same varieties were shown in the early stage of fermentation, when fully ripe, after they had passed the ripe stage and the cells were empty, and subsequent to that stage, when they had gone altogether bad and useless. The beginnings of vitality, when the cells were budding, and the later stage of the emptying of the cells, were the most interesting, and the fact that these processes can be shown by photography as clearly as, if not more clearly than, when under the microscope, marks photography as one of the most reliable handmaidens of science. In connection with these slides, Professor Hunter explained, when treating of the cell outlines, that the clear, well-marked lines shown did not actually exist. Nothing in nature, he said, was seen actually as it is. The cell walls are invisible, or at least they occupy so small a space as to be unrecognisable and the lines which were seen were due to the refraction of light, the same as in an air bubble. In some of the specimens the bacteria which develop in yeast were shown, and these, it was explained, are the same as are found in milk when it turns sour. It was believed to be due to these bacteria, he said, the Scotch bread has the peculiar sharp flavour which is missed in bread baked in southern countries, the Scotch bakers being in the habit of using a yeast which develops quickly. A number of plates containing bacteria alone, including those which produce the deadly anthrax, the harmless bacteria of natural decay, and the bacteria of influenza were shown. These, it was explained, could all be destroyed by dry heat, but it was a mistake to suppose that they could be destroyed by boiling, as some of them could, in the spore state, which seemed to be a condition they went into when nutriment failed them in one subject, survive a good deal of boiling. The presence of some forms of bacteria in food was objectionable, although they were always more or less present. Were, for instance, a gourmand to see under the microscope a partridge, which he delighted to have in a somewhat "high" condition, before eating, he would "swither" a little before putting it into his mouth. Of course, roasting killed the bacteria, and he then had the advantage of eating the small with the great, and so got double nutriment. Professor Hunter protested against the use of the word "photo-micrograph," illustrating his objection by pointing out that the corresponding word

for stellar photography would be "photo-stellargraphy," which would be misleading. The one should be "micro-photography," and the other "stellar-photography." The chairman, on behalf of the members, thanked Professor Hunter for the entertainment he had given them. Thereafter, two ordinary members, one of whom was a lady, were admitted, and the following were admitted honorary members of the Society:—Professor Hunter, Edinburgh, the lecturer of the evening; Professor Coleman Sellars, Philadelphia; Professor Meldola, London; and Dr. Eder, Vienna.

The Leith Amateur Photographic Society, besides being an active body, must be a popular one with outsiders, and worthy of the attention of manufacturers. At their usual monthly meeting on Tuesday night, the Fry Manufacturing Company distributed among the members specimens of their sixty-times plates, celluloid films, ivory films, bromide paper, and opal paper. Mr. Wm. Dougall presided at the meeting, and the business before them was to hear a paper by Mr. Robert Hunter, on "Limelight Exhibitions." Mr. Hunter's paper was a practical production, specially applicable to their own association, but it contained hints from which other associations might profit, such, for instance, as the recommendations that slides intended for exhibition should be properly labelled and described before being handed to the Secretary, that the slides should be sent in at least a week in advance of the meeting at which they are to be shown, and that a screen, paper-faced or otherwise, perfectly opaque, should be employed, so that no light should filter through it in the showing of the slides. It was reported that the Society's meeting-place in Duke Street is required by the firm adjoining, and the Secretary was empowered to look out for another room in which to hold their meetings. The meeting also agreed to hold an outdoor gathering on Monday, 20th April, the Edinburgh and Leith spring holiday, the place selected to be visited being Arncliffe, where there is one of the prettiest dells in Scotland, in which there is boundless opportunity for charming pictures of wood and water, as well as general landscape. It is to be hoped that the opportunity of visiting this somewhat private spot may be largely taken advantage of.

Another honour has fallen to the Leith Amateur Photographic Society in the obtaining, by Mr. A. Pitkethly, an AMATEUR PHOTOGRAPHER Silver Medallist, of a prize silver watch which was offered by the proprietors of the *People's Journal* for the best letter treating of "Amateur Photography." In giving his award, the competition editor says:—"What was wanted was such particulars regarding the best and simplest kinds of apparatus, their cost, etc., founded on the writer's experience, as might be useful to those beginning the art. From this point of view, the best paper is that written by Mr. Pitkethly." A Society which contains such members as the Leith amateur photographers are showing themselves to be can only have one movement, and that is forward.

Mr. F. Dundas Todd, an enterprising Edinburgh photographer, lectured on "The Art of Photography," to the members of Bonington United Presbyterian Church Young Men's Society, Leith, on the evening of Tuesday, 31st ult. Mr. Todd's remarks were of an historical nature, and were put together in a way that was both interesting and instructive. Lantern slides were shown of the portraits of the inventors of photographic processes, as well as of the bacilli of consumption, scarlet fever, splenic fever, and cholera. In entering as a competitor, Mr. Todd said, with the pictorial arts, photography was weighted with many disadvantages. The problem of photography in natural colours, much as had been heard to the contrary of late, still remained unsolved, and it was futile to compare the products of the camera with those of the brush and palette, since the charm of a picture often consisted of its beautiful colouring, but in the monochrome methods of expression, photography was held by many to occupy the premier position. To illustrate his remarks on this part of his subject, Mr. Todd showed several slides of landscapes, and also views of fishermen baiting their lines, a "stimie" at golf, and a picture of two young ladies, entitled "Confidences," which was taken by flash light. Mr. Todd, it may be mentioned, is in course of finishing an extensive series of photographs of Gosford House, at Longniddry, the newly erected palatial seat of the Earl of Wemyss, who was so long known to the volunteer world as Lord Elcho. These photographs, both interior and exterior, have been produced by Mr. Todd with much artistic skill, and are, many of them, works of art. Through his generosity, it may also be stated, some of them have already been used for newspaper illustration.

## Notes for Novices.

### THE DARK-ROOM LIGHT.

PROBABLY the consideration of the fitting up of a dark-room will be almost the first subject which will engage the attention of the novice. We intend, however, here to consider the question of a suitable illuminant. The most convenient, the safest, and the most regular is undoubtedly artificial light; daylight is at all times very fluctuating and uncertain, and it is important to have a constant and uniform illuminant, so as to be able to judge of the density of negatives, etc., and, moreover, there is much greater security in using artificial light, because such light is as a rule weak in the more refrangible and more actinic rays.

If daylight is used, and the window faces any position where it is possible for the sun to reach it, it is advisable to erect outside the window a moveable or permanent shield of wood, zinc, or corrugated iron, so as to prevent the access of sunlight. The size of the window, unless a dark-room be specially built, is generally determined, but the size of the window or panes of coloured glass may be decided by the operator, and about one square foot is quite large enough, although the quantity of light admitted is not of the slightest moment, provided the quality of that light is correct. The actual correct colour used for the coloured medium differs according to the bias of the authority who may be consulted on this point, some recommending stained red, others ruby glass, others again preferring orange and green glass—and others orange or ruby paper. We prefer paper when daylight is used; the ordinary orange-coloured paper and the deep ruby paper, when made translucent with vaseline, will give plenty of light and generally safe enough. A sheet of orange paper glued to a light wooden frame and then rendered translucent by rubbing with vaseline gives a very bright, good light, but when the window receives very bright diffused light, a second sheet of the orange or a sheet of ruby paper may be applied in the same way; it is advisable to have a third screen for use when working colour-sensitive or orthochromatic plates. We have found a special orange glass in the market which cuts off every vestige of light, from the ultra violet to D in the orange, and we have successfully worked very sensitive colour-sensitive plates by this light.

One of the greatest faults of all amateurs is in placing the light in such a position that it falls full upon the plate and the eyes of the operator. If a lamp be used, the lamp should be placed, not opposite the operator, but by his left side, so that his face is protected from the light, and the developing dish is also in shadow. When a window is used, an opaque screen of brown paper or wood should be so mounted that the operator and his dish receive no actual light; merely the light reflected from the walls and the diffused light in the dark-room should be used; then, when necessary to examine the negative, it may be momentarily held up to the light, but not close to it and only momentarily. There is no light which will not in time act on the film. If such a shadow screen be used, a very much brighter light may be used than without the same.

Now, whilst on this question, there are one or two points, on filling the slides, etc., which may be of service. First of all, always fill your slides in a weak, poor light. Very little is actually required to tell which is the film side of the plate. Always dust your plate before putting it into the slide. Some operators use a broad camel's-hair brush; we prefer a piece of soft wash-leather. A curious experience was related by an anonymous American writer last year on this point. He was very much troubled with pinholes, which the plate manufacturer stated were due to dust, and after repeatedly hearing this, the anonymous writer determined to be even with the plate-maker, and he very carefully dusted half the plate only, and on development the pinholes were still apparent and evenly distributed all over the plate. The question is, to what are the pinholes due then? We must defer giving our experience of these till later. It is always advisable to dust the plates, however, and also to dust the interiors of the slides. Having filled your slides, shut up your plate-box, and then taking each slide near the dark room light, open the slide shutter and see that you have the film next you. This will prevent any possible chance of the plate being the wrong way round; it is only necessary to draw the slide about half an inch. Having thus examined every slide, lock the shutter so that it cannot be pulled out by accident; this will also ensure

their being right home in the groove. These are but little details, but it is by attention to little details that we get perfect results, and such little things as these take up very little time and very little trouble. Always stick a piece of gum paper or a label over the edge of an opened box of plates, and write on it the number of plates removed and the date of opening.

## Apparatus.

### "COMPANION" HAND-CAMERA.

MESSRS. PARKER AND Co., of 288, High Holborn, in placing this camera on the market, announce that the idea they had in constructing it was to do away with much of the intricate mechanism

which only tended to confuse and irritate the users of hand-cameras, and often failed at the critical moment. The working of the camera (fig. 1) now before us is extremely simple; the turn of a screw with a milled head, and the lifting of a small lever about a quarter of an inch, changes the plate. The plates are placed in special sheaths, and are held in place by the small spring to be seen just

FIG. 1.

above the letter C in fig. 2. The reservoir being charged and returned to the camera, the first plate is in position for exposure which is given by pressing the lever E, the shutter being always set. The exposure having been made, all that is necessary to change the plate is to turn to the left the milled head at the back of the camera until a click is heard, and then to raise the lever A and return it to its first position. The plate then falls on its face at D. The exposed plates at D are prevented from falling when the picture is taken the vertical way, by tightening the screw B, which also prevents the back being taken out. The camera is fitted with a special rapid rectilinear lens, of  $5\frac{1}{2}$  in. focus, working at  $f/8$ , and rotating stops are provided. A light screen is fitted to shut off the light from the plates when the front is opened. The camera is well made and finished, and sells at £6 6s.

FIG. 2.

### THE "SCOTIA" CAMERA.

This camera, which is made by Mr. James Thomson, of Lintmill, Port Gordon, is of excellent quality and finish. It is very simple in construction, made of the best materials, and very light, but at the same time very rigid.

It possesses all the motions desirable in a camera, these being horizontal and vertical swing to the back, rise, fall, and swing to the front, and reversing back. The extension is a front one, but the back of the camera is made to slide to the front for the use of a W. A. lens, thus obviating the cutting off in the case of the base board projecting. The camera closes into very small space, the 15 in. by 12 in. being no more than  $3\frac{1}{2}$  in. thick when shut up. It is erected in a few seconds without the removal of a single screw. The prices are exceedingly reasonable, the cost of a  $6\frac{1}{2}$  in. by  $4\frac{1}{2}$  in., three double dark slides, being £5 5s., while that of a 24 in. by 20 in. is £2 15s.

## Amateur Photography.

BY ALEX. PITKETHLY.

WITHIN the limits of a letter such as this it is not possible to enter fully into the advantages to be derived from pursuing the fascinating pastime of "Amateur Photography," and at the same time comply with the lines laid down by the editor. I should have liked to dwell on its influence for good upon the health in taking us "far from the madding crowd" in search of the beautiful in nature, of its tendency to develop the mental faculties, how it quickens the perception of the eye, and enables us to place on permanent record the "faces we love and places we know," but, as space will not permit, I must take it for granted that these and the many other attendants of this delightful hobby are already appreciated by the readers of the *Journal*, and at once proceed with the subject proper of my letter. The first difficulty which presents itself to the individual hankering after photography is

### THE CHOICE OF APPARATUS,

the best size of camera and kind to adopt for outdoor work. To the beginner I would recommend that size known as half-plate, which yields a picture  $6\frac{1}{2}$  by  $4\frac{1}{2}$ , and my reasons for recommending this size are—the novice who purchases the smaller size of quarter-plate, or  $4\frac{1}{2}$  by  $3\frac{1}{2}$ , will, in nine cases out of ten, seek to dispose of it at the commencement of his second season, and purchase a half-plate, on securing which he will in all probability rest content, workers above that size being in the minority. A half-plate camera, with its necessary equipment, is quite sufficient for any ordinary individual to cope with on a day's outing, and in the hands of the beginner the "paying for your experience" is not so costly as it would be with a larger size, it more readily adapting itself to quarter-plates, which may be used until sufficient knowledge has been obtained to enable free use being made of the size of plate for which the camera is constructed. As to

### THE CAMERA

itself—do not go in for extreme lightness, as this in many cases means flimsiness; a little extra weight may be found advantageous rather than the reverse. See that the camera possesses a bellows of sufficient length to rack out to fifteen or sixteen inches, thus enabling the use of a long-focus lens, and at same time making it useful for copying purposes. To secure such an extension the camera should have a telescopic base board, the movement to which is given by means of rack and pinion, or winch screw. The camera should be square in rear, and provided with a reversing back to enable the plate to be changed from the horizontal to the vertical position, or *vice versa*. It should also be provided with what is known as a swing back for the purpose of bringing the plate into a perpendicular position when the camera may require to be tilted to include all the subject sought after, and thus obviate the chance of rendering the picture in a "toppling over" condition. It should also possess a rising and falling front and cross front; the former is an absolute necessity to enable the operator to move the lens up or down, so as to get rid of objectionable foreground, or upper portion of subject, as the case may be; the latter is essential only for carrying the flange of lens. The dark slides accompanying the camera should be double, and may either be solid or of book form—if the latter, preferably clamped at sides when closed—and the shutter ought to be hinged to enable it to be folded when drawn, and obviate its presenting a surface to the wind.

### THE LENS

usually supplied with a cheap outfit is that known as "Single Landscape," and for landscape work it is exceedingly effective, but for general usefulness nothing can equal a rapid rectilinear, which, as its name implies, is of a rapid type, and has the property of rendering straight lines correctly, in which the single lens fails. The focus of a rectilinear usually equals the diagonal of plate, includes an angle almost the same as the eye, and is therefore free from perspective distortion. Another advantage in possessing a lens such as this is, that either of the lenses of which it is composed may be used as a single lens of about double the focus of the combination.

### THE TRIPOD

should have more pretensions to solidity than the camera, and by all means see that a good sized tripod head is obtained. Some tripods are fearfully and wonderfully made. I would suggest one

folding at each joint, with some adequate means of clamping each fold in position, but without any sliding portions, as these latter are apt to get swollen with wet, and prove annoying.

### AN INSTANTANEOUS SHUTTER

is not a necessity, but as the novice will not likely be long ere he is anxious to try rapid work, I can with all confidence recommend the revolving disc shutters supplied by the popular makers of photographic outfits. Such a set as described can be purchased new for:—Quarter plate with single lens, £2 2s.; half plate with single lens, £4 4s. If rectilinear lens is substituted for single, add ten shillings to quarter and twenty to half plate, and for each dark slide in addition to one supplied with outfit, seven shillings and sixpence for quarter, and twelve shillings and sixpence for half plate. In fairness to the many makers, I refrain from publicly mentioning any particular one from whom to purchase. A good sized focussing cloth is indispensable, and it along with sufficient material to make bags for dark slides to protect them from light and damage may be purchased for 2s. 6d. while a good, stout, leather-bound canvas case may be purchased for 7s. 6d. quarter and 10s. 6d. half plate size. Having obtained an outfit, invest in the "Beginner's Guide to Photography," price 6d., in which will be found concise directions for the taking and developing of and printing from the negative, together with a capital article on exposure, "the stumbling-block in the way of all who handle a camera for the first time."—*The People's Journal*.

## Exhibitions.

### LIVERPOOL INTERNATIONAL PHOTOGRAPHIES.

No. V.

(By our Special Correspondent.)

AFTER a run extending something over five weeks the Liverpool International Photographic Exhibition is to close on Saturday of this week. During the run the show will have been open on thirty-one days, and up to date the attendance is given as 48,500; the full record will probably reach 51,000 or 52,000, an average of about 1,600 persons a day. The amount of money taken at the turnstiles substantially exceeds the amount taken at the previous exhibition in 1888. The expenditure has also been on an extensive scale, the executive having been both generous and enterprising in all departments. There will, however, be a handsome profit. Some little agitation was started in the local press a few days ago to induce the executive to reduce the charge of admission from 1s. to 6d. during the last week, but these gentlemen decided that the change in price was neither called for nor desirable. A more enjoyable and instructive resort than the big show has perhaps never been before offered to the Liverpool public, and they have availed themselves of the function to the full. It has been arranged that the show will really wind up with a ladies' social conversazione and dance next Thursday, the venue chosen for this interesting item being the City Hall, Eberle-street. Previous to the festivities the medals awarded to successful competitors in the exhibition will be distributed. A large attendance and a successful gathering is already practically assured. By the way, in company with Mr. Gambier Bolton, his grace the Duke of Newcastle has attended the exhibition and announced himself delighted in the extreme, not only with the pictures but with his reception.

### FINAL LIME-LIGHT ARRANGEMENTS.

Twelve fine demonstrations were arranged for the last week, one of the most novel, from several points of view, being the AMATEUR PHOTOGRAPHER idea of lantern slides, with portraits of the workers, being practically worked out on Thursday, when a number of slides by members of the Liverpool Association were shown to a large and appreciative audience. Another admirable set of views consisted of scenes, &c., in Ireland, got together by the Ulster Amateur Photographic Association, assisted by Dr. Cecil Shaw and Mr. James Stelfox. This collection is a very exhaustive series, quite out of the way of the beaten path, and differing entirely from the usual commercial slides. The Ulster Society are about inaugurating, at the instigation of Mr. T. S. Mayne, who showed the slides, a photographic survey of Ulster on the lines of the Birkenhead Society's Hundred of Wirral

Survey. The set will subsequently be sent the round of the Societies of Great Britain and Ireland.

Other lime-light shows of the week are Mr. Paul Lange's "Iceland" and "Norway," Mr. Lamond Howie's "Ober-Ammergau," Mr. Fred Clibborn's "Italy," Mr. E. M. Tunstall's "At Home and Abroad," Mr. Timmins' "Ship Canal," Mr. John Hargrave's "Hundred of Wirral," and Mr. George Thompson's "Eiffel Country."

#### PICTURES (CONTINUED).

In Class XXVa—841 to 9392b; general section; sundry exhibits for competition—there is some very excellent work. Three silver medal winners in the class are H. McMichael, 859 to 866; W. J. Byrne, 925 to 928; and A. Vandyke, 934 to 938. These three workers contribute very excellent studies, Mr. McMichael's work, two scenes from "Twelfth Night" and six pictures from "Enoch Arden," being exceptionally fine. The Manchester Society Challenge Competition, 841 to 858, shows some capital efforts, among the exhibitors being J. W. Wade, J. Davenport, T. Glazebrook, Miss Twist, &c. S. Bourne, in 868 to 871, has a very good quartet indeed—four studies of Killarney. Fred Hollyer, 890 to 899, reproductions of paintings by E. Burne Jones, Rossetti, Watts, R.A., etc., show up conspicuously, a very fine effort among the set being 899, a portrait of E. Burne Jones by Watts. No. 900, two cases of cabinet portraits (silver) by John Collyer, call for special notice, as do several of Richard Keene's 910 to 922. No. 923, a set of ten portraits of Professor Herkomer as "Filippo," by R. Downer, are splendidly done and quite a feature of the class. Maurice Bacquet exhibits in 924 admirable instantaneous portraits and landscapes, and then W. J. Byrne is again prominent with 925 to 928, Nos. 927 and 928 being perhaps the more meritorious. Harold Baker has nice portraits in 929 to 931.

Class XXVI.—940 to 958; President's prize; silver medal for ladies' work; any size, subject, or process; set of four pictures—though comparatively small is a good one, and boasts work of more than average merit. Miss Lil W. Tomkinson is awarded the trophy for a very well chosen and well executed set, 955 to 958, which include three landscapes, and the "Banqueting Room" of Haddon Hall. Mrs. Jeannie Welford shows capital work in 941, Mrs. C. M. F. Brockholes in 944 (frost scenes), Mrs. Janie W. Hignett in 946, and Mrs. S. Francis Clarke in 949. Other exhibitors in this class are Miss B. H. Langton, 940 and 950; Miss E. Haddock, 942; Miss Constance L. Salt, 943; Miss Rose F. J. Collier, 945; Mrs. Edith B. Wilson, 947; Mrs. Addie Dresser, 948; and Miss J. B. Kearsley, 951 to 954. Mrs. Janie W. Hignett, and Mrs. S. Francis Clarke receive bronze medals.

Class XXVII.—959 to 968, President's prize; bronze medal for beginners, youths under twenty, any size, subject, or process; set of four pictures—attracted ten aspirants, of whom Vincent Fothergill, 966, landscapes, was successful. J. B. Adamson shows creditable work in 960; C. M. Wane, 959; A. A. Chancellor, jun., 961; Arthur B. Swifte, 962; Philip Joseph Lehmann, 963; Theodore Rathbone Hubback, 964; George Massey Noakes, 965; Lumley Cator, 967; and A. L. Spilles, 968, are the other competitors. Altogether the studies in this class are very fair.

The class of the exhibition, "Champion Pictures," is, of course, excellent. The numbers range from 969 to 1,019 inclusive, the studies occupying one of the best positions in the galleries. Richard Keene exhibits thirty-three platinotypes, 970 to 975, all of which are well up to the mark and worthy their place. Lyd. Sawyer, with 976 to 983, shows several well-known medal pictures, all high class. Then comes Marshall Wane's 984 to 985; architectural interiors, landscapes, etc., by A. Schmitz, 986; superb cloud effects, 988, by J. L. Mackrell; 989, by W. J. Byrne; R. H. Lord's 997 to 999; W. Winter's 1,001 to 1,003 (portraits); Arthur R. Dresser's "Corbiere Rocks," 1,006; F. M. Sutcliffe's "Excitement," 1,005; G. West and Son's "Yacht Racing at Southampton," 1,007; Shapoor N. Bhedwar's "Feast of Roses," 1,009 (gold medal); C. Court Cole's 1,011 to 1,013; William Parry's 1,015 to 1,016; J. B. B. Wellington's 1,017 and 1,018 (gold medal), and Mr. J. P. Gibson's 1,019. The pose and printing of Mr. Bhedwar are surprisingly good and correct; and Mr. Wellington's 1,018, "Eventide," on matt surface is a model of mellowness and evidences the true artistic temperament of this widely known worker. Nearly every picture in the champion class is worthy of special mention. F. M. Sutcliffe's "Excitement" is unusually excellent, as is Mr. Court Cole's "Evening on the River," 1,012. The same worker's "The Evening Cloud," 1,011, though hard to beat, would be much better if the sky were improved a shade.

Among the "Not for Competition" pictures there are also many studies of note. Ralph W. Robinson's series of sixty-three "Artists at Home" are, of course, well known. They are a big feature—one of the biggest—in the show. The "Not for Competition" class extends from 1,021 to 1,100, and is largely hung in the Champion Class department. Louis Meldon's 1,022, "Pace Making," taken in 1/50 of a second, Paget plates, Ross 9 1/2 inch lens, is exceedingly clever, and has attracted a lot of attention. David Hedges and Sons are prominent with 1,025, of 1,025 and 1,026, "Enlargement of a Bull." Lyd. Sawyer is again represented with 1,030 to 1,032, and F. M. Sutcliffe also comes in again with 1,027 and 1,028, and 1,035 and 1,036. The two latter are the best frames, 1,036 being better than 1,035. H. P. Robinson shows a fine lot in 1,039 to 1,050—1,039, "A Strange Fish;" 1,040, "Against the Wind—A Race with Grand-dad;" 1,043, "What Sport?" being perhaps the pick. Paul Lange is represented with his magnificent Frost Studies, 1,052 to 1,054, and his no less beautiful studies, "Views in Norway," 1,055. No. 1,061, "Professor Blackie," by John Collier, is a lovely large portrait, and Harry Tolley's 1,063, "Bantry Bay," is another rich picture. In 1,071 Barraud's exhibit some fine portraiture, a picture of Stavenhagen being most admired. J. Gale's 1,079 to 1,083 are a superb quintet, Nos. 1,079, "House by the Stepping Stones," and 1,081, "Homewards from Plough," being perfection. G. Watmough Webster shows 1,085 and 1,086, the last picture, "Where's Mother?" being admirable in every detail. Of J. Pattison Gibson's display, 1,087 to 1,098, which are all alike excellent, it would be invidious to single any one study out for particular mention. Wm. Tomkinson, 1,100, shows an able panoramic view—"Bantry Bay."

In the Miscellaneous Section, Mr. John Noakes, a member of the Liverpool Amateur Association, shows an exhaustive series of views of transatlantic cattle ships, taken for the Liverpool Steamship Owners' Association. The ships are finely shown, sections, internal fittings, appointments, etc., included. J. L. Hawliezek exhibits, in 1,101a, "Views of Bosnia and Herzegovina, 1890," presented by the Governor of the provinces to him after his visit to that country. The proprietors of the *Daily Graphic* also show a series of blocks, etc., to illustrate the first inception of a sketch or photo to final newspaper print.

#### APPARATUS (CONTINUED).

One of the largest "trade exhibitors" in the exhibition is the firm of Messrs. Archer and Sons, Lord Street, Liverpool. They show chiefly the latest novelties in lanterns and lantern fittings, but they have also a comprehensive show of photographic materials in general and cameras. Their Excelsior lantern, Photinus, Miniature, Pentaphane, Metamorphoser, Ideal, Popular, New Scientific, enlarging and optical lanterns, and others, have drawn much attention, as have their Biunials, New Triple-rack, Exhibition, Triunials, etc. They also exhibit lantern microscopes, Lecturer's lanterns, New Single lantern, Terpuoscope lantern, and a host of other apparatus, a description of which would prove far too lengthy for the space at disposal. Most of these are the latest in the market, and all are exquisitely finished. A really profitable two hours may be comfortably spent at Archer's stall.

The Fry Manufacturing Company show very excellent enlargements on Fry's Naturalistic paper, and enlargements on opal.

Messrs. Robinson and Thompson show panel, cabinet, carbon, and other portraits, and platinotype interiors, Almirante Lynch, carbon opals, etc.

A. and G. Taylor's bromide opals, Royal and ducal personages, are much admired.

Medrington's, Hannan and McIlween, Hauser and Menet (Madrid), William Hume, Alfred Watkins, James Wood, the Birmingham Photographic Company, and other firms show interesting novelties.

Mr. T. Miller's Stereoscopic camera and Adelphi hand-camera occasion much comment, the Adelphi in particular being a favourite.

Mr. James Wood's Washer (improved) is likely to be very popular. It is claimed for it—rapid elimination of hypo (plates in fifteen minutes, prints thirty minutes), platinotype prints freed from acid in five minutes, etc. Adjustable for all sizes of plates.

I will conclude my notes of the show next week, when I hope to be able to give exact figures of the attendance, receipts, etc., with a concise review of the proceedings.

## Camera Club Conference.

THE fifth annual Conference of the Camera Club was opened at the Society of Arts on Tuesday, under the presidency of Captain Abney, and there was a good attendance. The President's speech was short, but interesting, as he dealt with two subjects of great importance to photographers of all parts of the globe. The first was the question of the desirability of establishing a uniform standard of sizes for plates, on which point he was decidedly of opinion that such a system should be set up, and expressed the opinion that the English half-plate ( $6\frac{1}{2}$  by  $4\frac{1}{2}$ ) should be the unit, that size being practically equivalent to the French 26 by 18 centimetres; all other sizes should be multiples of that figure. The next point was that of standard weights and measures, and while he was of opinion that the decimal system would not be accepted by England, he thought that a compromise might be arrived at by accepting the grain as the unit of weight, and the drachm as the unit of volume. Referring to M. Lippmann, whom he had recently seen in Paris, Captain Abney said that the plates shown him did really show the colours of the spectrum by reflected light, but not by transmitted light, and as his idea of photography in natural colours was the production of a pigment which would register the various colours thrown on the plate, he felt that photography in natural colours was as far off as before M. Lippmann's discovery. A short discussion took place on the question of the weights, measures, and plates, and the general feeling seemed to be that it was desirable that there should be a universal standard for all of them. Mr. Warnerke also advocating a universal standard for measuring the rapidity of lenses.

Mr. Lyonel Clark then read a paper on "The Use of Uncorrected Lenses," those with which he dealt being common spectacle lenses, which he said were effective when softness, as opposed to absolute sharpness, was desired.

Mr. Debenham explained that there seemed to be amongst photographers a misconception with regard to the word sharpness. By that term artists meant hard cutting lines, while photographers meant well defined. His view was that they should get photographs as sharp as the lens would let them.

Mr. Dallmeyer said that what could be done with single lenses was wonderful, and the desire of opticians was to do away, so far as possible, with the difficulties inherent in them.

Mr. Traill Taylor showed two or three lenses consisting of simple lenses of very ancient date.

Major Nott, in the absence of Mr. Joseph Pennell, read that gentleman's paper on "Photography as a Hindrance and a Help to Art." The title of the paper was somewhat of a misnomer, at any rate so far as its second portion was concerned, for it consisted of a vigorous attack on photography, in the course of which it showed that "the so-called art photography endeavoured to produce by machinery what the true art-worker produces by skilled handicraft . . . Photography never does and never can make selection . . . I believe it is a canon of faith with photographers that they have made artists more accurate, that in many ways they have brought them down to date. I do not admit this for a moment . . . I am not aware that artists owe any more to Mr. Muybridge—I mean always the greatest artists—than the conclusive substantiation which he has given to facts which were known to artists themselves from the earliest times . . . Mere outline, which is all that photographers can at times give directly, is but one feature of any object in nature. Truth of light and shade, colour and tone, no photographer ever has recorded, or, I believe, ever will record. . . . But it may be asked, then, of what use is photography to artists; and why do nearly all of us use it? Because it is to many, as to you, a most interesting and fascinating study apart from our work." It concluded by saying, "But although I have no doubt that photography will aid artists in an infinitude of ways now undreamt of, so long as there is any love of art it will never supersede it or become in any way its serious rival. Not that I question in any way the ultimate popular principle of photography. With the general public the greatness of the photographer is as assured as that of Mr. Henry Arthur Jones or Mr. Rider Haggard; and eventually the artist may be told by the people he has educated that he must go. From the saving remnant, however, he has nothing to fear."

Mr. Maskell took up the cudgels in defence of photography, and said that Mr. Pennell appeared to be ignorant of the

advances photography, artistically considered, had made in the last few years. Let him not mix up the professional photographers and the dilettanti amateurs with those who strove to produce works of individuality and originality. The work of Professor Muybridge did not claim to be art. It was not true that no true rendering of light and shade could be got by photography. The artistic photographer was moderate in the estimate of his art, and did not claim to rival the great painters and etchers, but he did claim some at least of that individuality which entitled him to some place, if a small one, in the wide field dignified by the name of art.

Mr. H. P. Robinson stated that the paper should not be dealt with seriously, and should have been received in solemn silence.

Mr. Debenham said as a matter of fact it would be found that since the advent of photographs of animals in motion there had been a great change in the manner in which artists drew them. Those photographs had taught the people the truth, and they were no longer satisfied with the conventional rendering of horses in motion. This was specially shown in the difference between the illustrated papers of fifty years ago and of to-day.

Mr. King said he had been in the photographic business for forty-five years, and he had supplied many artists with photographs. A very expensive book about Westminster Abbey had just been published, and the whole of the etchings had been done in facsimile from photographs without any alteration.

Mr. G. Davison said Mr. Linley Sambourne, a great black and white artist, had written to him to the effect that he had always used photographs and was always ready to confess it. The paper was full of unsupported assertions, some of which showed that Mr. Pennell was totally innocent—that was a better word than ignorant—of photography, which was the real cause of his making the statements he had done. The writer tried to establish a distinction between photography applied to art and monochrome drawing applied to art. The difference was really only one of degree. They might admit the difference in degree in the power of emphasis and expression, but certainly not that the latter were wholly absent in photography. The most extraordinary assertion in the paper was that which claimed that detail was better given by the draughtsman, and more faithfully rendered than by photography. He would ask Mr. Pennell to go and examine the transparencies by Mr. Stevens on view at the Club, in which the detail seemed to him far beyond what had ever been or ever was likely to be done with pencil or brush. The writer spoke of the camera as "a machine with no sense or feeling, a machine which does not even receive the impression of objects in the same proportions as you do." That showed the writer's utter ignorance of the use of photographic appliances.

Major Nott desired to say a few words so that he might not be taken as identifying himself with the paper which he had read. The paper showed that the writer knew nothing about his own art. If he knew anything about the modern French school he would know that it owed its charms to the fact that the artists had recognised the fact that photographers had influenced public opinion, and people would have exactness and correctness, and so the artists had to supply the article.

Mr. Humphrey said Mr. Pennell had been asked to come and bless them, and he had altogether cursed them. Photographers, as a rule, had a fair estimate of their own merit, and would stand a great deal of abuse, but a little correction occasionally was good for them, as it would help them to a greater excellence in their work. When they looked at the work of an educated artist like Mr. Burchett, they got some idea of what photography would do in the hands of a true artist.

Mr. V. Blanchard pointed out that in the earlier works on cathedrals nine-tenths of the plates were utterly false and offensive, while in the latter publications of Cassell and Co. the correcting effect of photography was to be seen.

Mr. Welford said that in Mr. Pennell's earlier writings he spoke very differently of photography.

The Chairman was rather sorry that the paper would be printed in the Journal of the Club, as it might lead to a false impression. With respect to a question of pen and picture, he always understood that perspective was perspective, and could be nothing else, even if a wide-angle lens were used. Professor Muybridge's photographs had taught artists a great deal, and he was glad that there were many artists ready to admit the fact. It was well for them to show that they were not completely crushed to

the wall, and that there was something to be said on their side.

The paper on "A Note on the Physiological Aspects of Some Problems in Art," by the Rev. F. C. Lambert, M.A., was taken as read, and the Conference adjourned.

## Quarterly Examinations in Photography.

**Question 31.**—Describe in detail the process for stripping the film from a negative.

**ANSWER.**—The negative should first be hardened by immersing in a solution of chrome alum for about fifteen minutes, washed and dried. It is then given a thick coating of enamel collodion, which when set is washed until all signs of greasiness disappear. The collodionised negative is next immersed in a solution of hydrofluoric acid (1 to 10), and the dish containing it gently rocked until the corners of the film lift and the film blisters, when it is floated off the plate into a dish of clean water. A plate is prepared by polishing with French chalk and coating with collodion, which when set is immersed in water until all greasiness has disappeared. This plate is then slid under the film, which is arranged in place on it, and both removed together from the water, covered with a piece of tracing cloth, and squeegeed to ensure perfect contact between the two. The tracing cloth is then removed and the film allowed to dry. When dry, a knife is inserted under the film round the edges, and it can then be stripped off. Instead of squeegeeing on to a film of collodion, the stripped negative may be simply washed and allowed to dry.

WORFIELD.

**Question 32.**—What do you consider the best method of packing plates or negatives for transmission by post?

**ANSWER.**—The plates should be packed in pairs, film to film, with a strip of paper one-eighth inch wide between them at the edge; undeveloped plates should not have anything in the centre, as pressure will cause reduction of silver; but negatives travel better with paper the full size. The plates should then be wrapped in some non-actinic or opaque paper which contains nothing that will give off fumes or that will fog the plates; then a layer of waterproof paper should be put on to prevent damp or gas fumes spoiling the plates; if they are to go a sea voyage they had better be wrapped in tin-foil. If the plates are large, a piece of wood should be placed at the top and bottom of each package, but for small plates ribbed paper packing is sufficient.

**Question 33.**—Describe the production of a Woodburytype print.

**ANSWER.**—Collodionised plate-glass is coated with—

Gelatine	...	...	...	...	...	3½ oz.
Sugar	...	...	...	...	...	1 "
Glycerine	...	...	...	...	...	100 gr.
Carbolic acid	...	...	...	...	...	2 min.
Indian ink	...	...	...	...	...	2 gr.
Ammonia .888	...	...	...	...	...	60 min.
Ammonia bichromate	...	...	...	...	...	300 gr.
Water	...	...	...	...	...	12 oz.

Allow 5 oz. of solution for each square foot. Dry very quickly in a calcium box; the temperature must be kept below 85 degs. F. When dry the film is to be stripped from the plate. The film is now exposed behind a reversed negative, the exposure being somewhat longer than for an ordinary carbon print. The film is carefully put on to glass which has been coated with a 5 gr. solution of rubber in benzole. A roller squeegee is useful here for getting rid of air-bells. The glass bearing the film is placed in a grooved box in water at 105 degs. F. When the water flows off without a yellow colour the temperature may be increased to 160 degs. F. The development takes some hours to complete. When developed, soak in a 4 per cent. solution of chrome alum for a few minutes, wash, and then put in spirit for an hour, dry, and then strip from the plate. Place the film on a lead plate, and expose to a pressure of 4 tons per square inch. To print, the lead plate is put in a press and a pool of ink (1 gelatine, 5 water, colour q. s.) is poured on in a melted state, a piece of water-proof paper is placed on the pool of ink, and the top of the press brought down; when the ink has set, the paper is taken off the mould with the picture adhering; wash in a solution of alum, then in water, and dry. The print must have the margins cut off, and may be varnished or rolled.

C.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Barrow in Furness (Photographic Section) Field Naturalist Club.**—The annual meeting was held on the 2nd inst. The annual report was submitted for approval and adopted. The following officers were elected:—Mr. A. Blechy, President; Mr. W. Dunlop and Mr. R. Spencer, Vice-Presidents; Mr. J. Redhead, Secretary. Mr. F. W. Walton showed the method of producing lantern slides by the wet collodion process, several plates being coated, exposed, and developed at the meeting.

**Bedford.**—At the annual general meeting held on the 3rd inst., the President (Dr. Beaman) in the chair, the report and balance-sheet were adopted and the rules were amended, the subscription being reduced to five shillings per annum for ordinary members, and one shilling per term for boys attending the various schools in the town. The officers for the ensuing year were elected as follows: President, Deputy-Surgeon-General A. H. Beaman. Committee: Messrs. W. O. Kirby, H. W. Stewardson, and C. E. Wareing. Treasurers and Secretaries: Mr. A. Kirby, junr., 8, Harpur Place, and Mr. C. Perrott-Smith, 57, The Grove, Bedford. It was resolved to hold the meetings for the future monthly. On the completion of business those present examined the prints sent in for the AMATEUR PHOTOGRAPHER Monthly Competition, No. 18, Inland Scenery. They were very much admired. The names of six new members were proposed, and altogether a very successful evening was spent.

**Birmingham.**—The ordinary meeting was held on the 2nd inst., Mr. E. W. Jones in the chair. The Secretary reported that on March 11th a very successful entertainment was given by Mr. E. H. Jaques at the Temperance Hall on "Through Ryfylke to Hardanger, Norway," illustrated by 160 lantern slides. Mr. A. J. Leeson exhibited and explained Marion's "Radial" hand-camera, which has several novel points. One of the principal is the way the plates are stored in radiating grooves ready for exposure. He also exhibited Thornton Pickard's new instantaneous shutter, which, with a small aperture and working between the lens, gave an exposure of  $\frac{2}{25}$  second; also Messrs. E. and T. Underwood's new instantaneous blind shutters with  $\frac{1}{2}$  inch and  $\frac{2}{3}$  inch apertures, the fastest speed registering  $\frac{1}{16}$  second by shutter chronograph. The Chairman then called on Mr. E. C. Middleton for his demonstration of "Carbon Printing." The Secretary announced that Mr. J. Howson, of the Ilford Co., had consented to show the working of their Alpha and bromide papers on the 9th inst.

**Bristol.**—On the 2nd inst. one of the most successful and pleasant meetings of the session was held. Mr. Bryant presided over a good attendance. The President of the Society, Mr. Harvey Barton, gave a most interesting demonstration on "Flash-Light Portraiture," which was listened to with marked attention by the members. Mr. Barton, who was frequently applauded, after a few remarks on the introduction of magnesium in connection with photography, exhibited several forms of flash-light lamps, and afterwards, with the kind assistance of some young ladies, who had accompanied him for that purpose, proceeded to make several exposures by means of a series of lamps of his own construction, erected on moveable wooden arms, and which were capable, through the medium of a foot-bellows, of giving eight simultaneous flashes. The plates were subsequently developed, pyro potash being used. The various stages of development were closely watched by the members, and numerous questions were asked. A very artistic and successful set of flash-light portraits were exhibited in the room, which, Mr. Barton explained, were his first efforts in that direction. They were very much admired by all present.

**Cornish.**—Mr. H. Tonkin, Hon. Sec., will read a paper on "Enlargements" on the 14th inst.

**Croydon.**—Owing to an error in the counting last week, the second prize at the exhibition was announced as being awarded to the wrong picture. The following is the amended prize list:—Class A: silver medal, Mr. G. Carden; highly commended, Mr. Elliot; commended, Mr. Blow. Class B: silver medal, Mr. A. E. Isaac. Class C: silver medal, Mr. H. Maclean; bronze medal, Mr. A. J. Sargeant; certificates, Mr. G. H. Elliot and Mr. C. E. Whittaker. Class D: prize winners, Mr. C. F. Oakley; highly commended, Mr. A. W. Hirst.

**Croydon Micro.**—An ordinary meeting was held on the 3rd inst., Mr. Edward Lovett (President) in the chair, when Mr. A. R. Dresser gave a paper entitled "The After Part of the Hand-Camera Negative," illustrated. Mr. Dresser in his remarks gave a brief outline of the method he adopted for developing hand-camera negatives, but entered largely into the intricacies of solar enlarging, and making slides. He also explained and illustrated a simple arrangement for

"Dreaming of the Dreams of Long Ago" is the title of a full-page illustration in the April number of *Old Jonathan*, which has been reproduced from a photograph taken by Mr. Ernest R. Shipton.

enlarging or copying a negative that had been taken askew; the carrier holding the plate to be copied rotating within a turntable. A large number of fine enlargements made from quarter-plate negatives were exhibited, and a good number of slides were passed through the lantern, and were well appreciated by the members.

**Elizabethan.**—On the 2nd inst. the members and their friends spent a very pleasant evening together in the hall of the Boys' Grammar School, Barnet, when Mr. Louis Medland, whose skill in photographing animals is well known, exhibited some 250 slides of animals and birds, to an audience of rather more than 250 people. The exhibitor briefly described the peculiarities and habits of the animals, as the pictures were thrown on the screen. As examples of so-called "instantaneous" photography, pictures were shown of horses in the act of taking a water-jump, a feat more satisfactory to the camerist than the rider. Of the animals in the Zoo the pictures most appreciated were—the lions, the bear on pole, zebra, antelopes, kangaroo with young, pelican, bearded vulture, and "Sally;" many of the pictures, owing to the extraordinary attitudes in which the photographer had been fortunate enough to catch the creatures, provoked much laughter, but one and all of Mr. Medland's own 240 slides excited great admiration. A number of slides painted some thirty years ago were shown, and also some made from Egyptian monumental figures; the sculptors of the Land of the Pharaohs could evidently represent animals far better than the artist (?) of thirty years ago. It is to be hoped that these painted slides will not fall into the hands of some future evolutionist, or his theories will have to be considerably modified to account for such *luses naturee*. Not the least interesting feature of the exhibition was a collection of reproductions of extinct animals, presumably taken from the casts at the Crystal Palace. The lantern was provided and very ably manipulated by Mr. Lambert Matthews. It was announced that a series of *outings* would be arranged for the summer months.

**Faversham.**—The monthly meeting of this Society was held on the 24th ult., Dr. C. J. Evers (Vice-President) in the chair. A very interesting collection of lantern slides was arranged on view in the slide stand, consisting of all the sets of slides sent in for Dr. Evers' Lantern Slide Competition, together with a number of Alpha slides, printed and toned by the Doctor himself, and exhibited as illustrations of the "practical demonstration" he had promised to give. The Hon. Secretary announced that the following members had competed for Dr. Evers' prize, viz.: Capt. Hooper, Messrs. W. C. Stunt, H. Dan, C. Cremer, R. Woodruff, and F. Crosoer; and a letter from the doctor was read, expressing his gratification at the excellence of the competition, and announcing the result as follows: Prize to "Alert," Mr. H. Dan. Highly commended, "Voyageur," Mr. F. Crosoer. Commended, "Vrill," Mr. W. C. Stunt. Dr. Evers then presented his prize, consisting of a volume, the "Dictionary of Photography," by E. J. Wall. The Hon. Secretary said that he had been entrusted by the Editor of the AMATEUR PHOTOGRAPHER with the pleasing duty of presenting to Mr. W. C. Stunt the Bronze Medal for the best print taken at the Society's summer excursions. At the request of the Chairman, Mr. Stunt consented that the medal (which was very handsome and much admired) should be on view at the Society's first annual exhibition, in April. In fulfilment of his promise, Mr. C. Cremer, assisted by Mr. F. C. Jackman, exhibited—by the aid of his excellent Pamphengos lanterns—the competitive lantern slides, together with the examples of Alpha plates, lent by the Chairman. Dr. Evers then proceeded to give his promised "Demonstration on Printing and Toning Alpha Lantern Plates," minutely explaining every detail of the process, in a thoroughly practical manner. Four plates were printed from the same negative but of different periods of exposure, in order to produce different tones of colour. Hydroquinone was the developer used, whilst the combined toning and fixing bath was as follows: Acetate of soda 30 gr.; sulphonycyanide of ammonia, 50 gr.; hyposulphite of water, 1 oz.; water 4 oz. When all dissolved, add chloride of gold 3 gr. The doctor explained that this solution can be used till exhausted, will suffice to tone from two to three dozen plates, and will keep good for a month or two. A hearty vote of thanks was accorded to Dr. Evers for his able demonstration, and Mr. Percy Dan kindly undertook to give a demonstration on "Intensifying and Reducing," at the next meeting, on 21st April.

**Haltwhistle.**—The monthly meeting was held on the 28th ult., Dr. Speirs (Vice-President) in the chair. The evening being devoted to a lantern exhibition, the attendance of members and their friends was large. The next meeting will be held on Monday, the 13th April, when a demonstration on "Lantern-slide Making" will be given by the Secretary.

**Holborn.**—The third annual general meeting was held on the 3rd inst., Mr. T. O. Dear (Vice-President) presiding; over thirty members being present. Before receiving the reports of the Treasurer and Committee, Messrs. G. Luxton and F. Henderson were elected members of the Club, and the Secretary read a letter from the London County Council granting permission for the members of the Club to photograph in Waterlow Park on the 11th inst. The Treasurer then

read a statement of the income and expenditure of the Club for the year ending March 31st, 1891, showing a net balance in favour of the Club of £18 2s. 3½d. The Secretary read the report of the Committee, which showed that during the past year nineteen members had been elected, while eight had resigned. With regard to lectures, they had been very successful, while the various lantern entertainments during the year had proved very attractive. During the summer months the club had made excursions in the neighbourhood of Carshalton, Epping Forest, Greenwich, Highgate, Kew Gardens, Laindon Hills, St. Albans, the Temple, and Wanstead Park, all of which were well attended. Thirty-eight members and friends sat down at the annual supper in November, while 69 were present at the annual exhibition and cinderella in March. On the whole, it was considered that the club had made very satisfactory progress during the past twelve months. The reports having been adopted, the question of raising the subscription was considered. After a long discussion it was decided to raise the subscription to 7s. 6d. Another addition having been made, it was resolved that Rule II. of the club should read as follows: "(2) The annual subscription shall be, for gentlemen 7s. 6d., with entrance fee of 5s.; for ladies 2s. 6d., without entrance fee. All subscriptions and entrance fees shall be paid in advance. Any member who shall have omitted to pay his or her annual fees by the following first of July shall, after having received two applications at one month's interval from the Secretary, cease to be a member of the club, except in special cases to be decided by the Committee." The following officers were then elected: President, Mr. T. C. Hepworth, F.C.S.; Vice-President, Mr. Fred Brocas, Mr. S. T. Chang, Mr. T. O. Dear, and Mr. R. B. Lowe; Hon. Secretary, Mr. J. E. Smith; Assistant Hon. Secretary, Mr. Herbert Thompson; Treasurer, Mr. Albert Pell; Librarian, Mr. H. C. Gay; Committee, Messrs. E. H. Bayston, E. Benest, F. J. Cobb, A. J. Golding, Alfred Hodges, F. Knights, and R. Luxton. Ten members attended the club outing to Richmond and Kingston on Easter Monday, and an enjoyable day was spent in this beautiful neighbourhood.

**Ireland.**—An informal meeting was held on the 3rd inst. A highly instructive and interesting paper was given by Mr. J. H. Hargrave, B.A., Hon. Sec., on the "Optical Properties of Shutters." Mr. Hargrave demonstrated by means of the blackboard, and also by lantern-slide diagrams, the advantages, or disadvantages, of using the instantaneous shutters in every-day use amongst photographers in various positions, viz., (1) in front of the lens, (2) between the combinations of a doublet lens, (3) behind the lens, (4) in front of the plate; and stated that a blind-roller shutter working in the latter position possessed the highest efficiency, as it did not interfere with the rays of light passing through the lens.

**Isle of Thanet.**—A meeting was held on the 1st inst., Mr. Walter Saunders (Vice-President) in the chair. Professor Tweedie gave a practical demonstration entitled "Hints on Lantern-Slide Making," and said he used by preference Alpha plates developed with hydroquinone. Having exposed some plates, he proceeded to develop them in tanks or cells in the oxyhydrogen lantern, the light being passed through ruby and orange screens, which were removed as development proceeded. The process was very clearly shown and most ably explained, and was followed by those present with much interest. After washing, which the lecturer reminded the junior members should be thorough, he proceeded in the same manner to show the processes of fixing, reducing, and toning, that of reducing or clearing being very satisfactorily shown by some slides purposely veiled. Several useful formulæ were given.

**Leeds.**—On Thursday the 2nd inst., Professor E. H. Jacob, M.A., M.D., read a paper on "Winter Photography." Dr. Jacob said that photography in the winter was far too much neglected by amateurs. He dwelt on the greater truth to nature of winter photographs, the values of the almost monochrome pictures being more correct than views which contained a profusion of colours, mostly green, while from an artistic point of view there were a large number of spring and winter views of great beauty. As subjects for pictures, he instanced (1) Buildings, the greater part of which is frequently in summer obscured by trees or foliage, and interiors in the same way are often shaded by trees. (2) Snow scenes, or pictures taken during a hoar frost, which formed some of the most beautiful subjects for the camera. (3) Trees. Here the photographer had a great advantage over the artist with the brush, for the winter trees could be rendered with absolute accuracy. He thought people were unaware of the great beauty of most trees without leaves, especially the birch, the elm, and the oak, besides the artistic value; a collection of good photographs of leafless trees would be most useful from a botanical point of view, and should find a place in the collection of every school of botany. Some of the most beautiful trees he had seen were to be found in Nuneham Park, near Oxford, and in Studley Park. (4) General winter landscapes, where interest was given mostly by the conformation of the land, hills, buildings, or by contrast of bare trees with evergreens. Seaside views were better in winter than in summer, as the waves and skies were more varied. Dr. Jacob illustrated his paper throughout

by a series of lantern slides of winter scenery, including a number of fine forest trees from the parks referred to above. Mr. J. W. Addyman, B.A., brought before the members an account of the recent investigations of Col. J. Waterhouse, S.C., Assistant Surveyor-General of India, respecting electro-chemical reversals with thiocarbamides, in which the members were much interested.

**Lewisham.**—The annual general meeting was held on the 3rd inst., and the following gentlemen were elected officers for the ensuing year: President, Rev. J. Morley Wright. Vice-President, Mr. Alfred H. Miles. Committee: Messrs. E. Eastwood, R. W. James, M.I.C.E., M. Stodart, and Prof. Lambert, M.A. Hon. Secretary and Treasurer, Mr. B. Davidson, 62, Manor Road, Brockley, S.E.; and Assistant Hon. Secretary, Mr. H. M. C. Sprunt, 192, New Cross Road, S.E. Previous to the election, the meeting was made special for alteration of rules. The next meeting will take place on April 17th, when Mr. A. R. Dresser will give a lantern exhibition and demonstration.

**Morley and District.**—The last meeting of this session was held on the 24th ult., the President (Mr. S. Atkinson) in the chair. The formal business being disposed of, the President gave a lecture on the "Optical Lantern," illustrating his remarks with several diagrams and his own lantern.

**North Middlesex.**—On the 4th inst. a well-attended meeting of the members and friends of the Society was held to bid farewell to the President, Mr. J. Humphries, F.S.A., who is about to leave London for Glasgow, where he will in future reside. A smoking concert was organised, Mr. W. T. Goodhew, Vice-President, in the chair; and the following gentlemen gave songs, instrumental solos, and readings:—Messrs. Hiscock, Cherry, Harper, Hewson, Marshall, Mummery, Saville, Baker, Beale, Stuart, Pithes; and a friend of Mr. Cheney presided at the piano. The event of the evening was the presentation of an illuminated address, bearing the signatures of the members, to Mr. Humphries. In making the presentation, the Chairman said that the success which had always attended the Society had been to a very great extent due to the business abilities and amiability of Mr. Humphries. He had ever shown himself ready to support and advance the Society, regardless of the sacrifice of his own time and convenience, and in bidding him farewell the members felt that they were losing an officer whom they could not replace. Mr. W. H. Walker, Vice-President, in endorsing Mr. Goodhew's remarks, said that Mr. Humphries' amiability was the velvet glove that covered an iron hand ever ready to direct and firm to control. He thanked him in the name of the members for his valuable services, and wished him God-speed wherever he might be. Mr. Louis Medland, as a visitor and an old friend, joined in wishing Mr. Humphries success in his future career. The first photographic meeting he had attended was a lecture by Mr. Humphries. He had been impressed then with a respect for him which had deepened and strengthened ever since. Mr. Humphries, in reply, said that the work he had done for the Society had brought its reward in the kindly feelings it had generated. Although he could no longer attend the meetings, he would always remain a member, and cherish the warmest feelings of friendship for those with whom he had worked. The address, with its signatures, would be one of his most favoured possessions. It would be a source of constant pleasure to him, and would be, he felt, an "open sesame" to any photographic society he might wish to join. The North Middlesex would advance and prosper, for he knew the value of the officers who formed its council. The meeting continued to a late hour.

**Photographic Society.**—At the technical meeting held on the 24th ult., Mr. W. Bedford being in the chair, the Assistant Secretary read a letter from Mr. G. Houghton accompanying two works entitled "Excursions Daguerriennes," containing a large number of plates drawn from daguerreotypes taken prior to 1841, and an advertisement from "Fraser's Advertiser," dated 1840, relating to them. The subject for discussion was "Hand-Cameras." Mr. Chapman Jones showed and explained his quarter-plate hand-camera, and Messrs. Smith and Sons' Memorandum camera. Mr. Leon Warnerke brought three cameras for exhibition. The first was a camera made in Russia ten years ago; the second, a camera of French make, with a hemispherical front; and the third Stirn's hand-camera. Mr. T. F. Hoban exhibited Loman's Reflex camera, for which Messrs. Mawson and Swan are the English agents. Mr. Percy Hargreaves described Messrs. Houghton and Sons' Automatic camera. Mr. F. J. Moulton, on behalf of the Eastman Company, showed seven forms of Kodak cameras; the shutters attached to the larger sizes were much admired. Mr. J. Pettingall exhibited two forms of Messrs. Robinson and Sons' Luzo camera. He also laid before the meeting an enlargement from a negative taken with a larger sized camera. Mr. R. C. Murray explained Dines' hand-camera brought out by Messrs. J. J. Griffin and Sons. The Assistant Secretary showed on behalf of Messrs. Griffiths, their guinea and guinea and a half cameras. He also explained the Graphic camera of the London Stereoscopic Company. Mr. E. W. Parfitt described Hume and Parfitt's camera, made by Messrs. Humphries. Mr. E. A. Cade exhibited and described

Messrs. Marion and Company's Radial camera. Mr. J. A. Sinclair, on behalf of Messrs. Adams and Co., described their Ideal and Adams' cameras. Mr. C. Cusworth showed his very simple and ingenious Repeater camera. Mr. W. B. Parker described Messrs. Parker and Company's Companion camera. Mr. J. F. Shew showed two forms of his camera, and an ingenious method for focussing the lens. Mr. C. C. North exhibited a new camera he has devised. Mr. T. Samuels pointed out what he considered were the essentials of a hand-camera, and described two of his instruments, and explained their numerous adjustments. On the motion of the Chairman a hearty vote of thanks was passed to the above-named gentlemen for bringing cameras with them. Mr. Leon Warnerke then described some experiments he had been making upon colours produced by interference, and showed that the colours obtained when a negative, prepared by the powder process, mentioned in his collotype lecture, was collodionised was due to interference, produced by the reflection of light from the graphite. He also showed some coloured images on albumenised paper obtained by printing through a negative composed of strips of coloured glass on albumenised paper, the sensitised surface of which was in contact with mercury. The colours were strong and distinct and were visible both by reflected and transmitted light, but the colours disappeared on fixing. At the technical meeting on March 31st, Mr. Chapman Jones, F.I.C., being in the chair, the minutes of the previous meeting having been read and confirmed, Mr. T. E. Freshwater showed his miniature lantern. A lantern display then took place; slides were contributed by Messrs. S. T. Chang, H. M. Hastings, Mawson and Swan, E. W. Parfitt, H. Chapman Jones, H. R. Hume, S. Ashburner, W. England, and A. Mackie. Mr. T. E. Freshwater then exhibited some slides in his miniature lantern. The exhibition was greatly appreciated by the members and friends present.

**Richmond.**—The first field-day of the season took place on Easter Monday, when nine members visited Cobham and Ockham, and, in spite of the wintry weather, succeeded in getting some good negatives. The 3rd inst. was a lantern night. Mr. Faulkner presided. Mr. Ardaseer showed and explained the new pneumatic shutter of Adams' "Ideal" hand-camera, an ingenious and beautiful bit of mechanism. Mr. Cembrano again lent his lantern; and slides by the following members were shown:—Commander Tudor, Messrs. Ramsay, Hunter, Ardaseer, Richardson, Faulkner, Perry, Bickerton, Garrett, and Cembrano; as well as a very beautiful set of views at Windsor Castle by Mr. Brooks of Reigate.

**South London.**—The second annual meeting was held on the 3rd inst. At the last annual meeting the strength of the Society was sixty-three. During the past year there had been an influx of forty-four members, the present strength thus being 107. It was resolved to impose on all who enter after May 3rd an entrance fee of 2s. 6d., and to change the meeting night to the first and third Mondays in the month, such change to take effect on and after May 17th. The following election took place: President, F. W. Edwards. Vice-Presidents, M. Howell, Dr. Munyard, W. Rice, H. G. Banks. Committee: Messrs. Boxall, Farmer, Fellows, Fitness, Groves, Herbert, Kelly, Lyon, F. Webb. Hon. Treasurer, A. E. Whitby. Hon. Secretary, S. W. Gardner, 7, Barry Road, East Dulwich, S.E. The balance-sheet showed a balance in favour of the Society of £4, and the fixtures account to the value of £3.

**Southport Social.**—On the 25th ult. at 15, Cambridge Arcade, Mr. Cross gave a very instructive demonstration on "Intensification and Reduction." Several negatives made by members were treated, with very gratifying results. On the 1st inst. was the usual monthly "social," when various novelties of a most interesting nature were exhibited, and a very pleasant evening spent.

**Tunbridge Wells.**—The ordinary meeting was held on the 2nd inst., when there was a large muster of members, Mr. A. Marshall being in the chair. Mr. G. W. Cuming was duly elected a member. Dr. Prince was to have given his experiences of photography forty years ago, but, unfortunately, through indisposition he was unable to be present, his paper being postponed till the May meeting. Mr. Dresser sent over a hundred slides from pictures taken with his hand-camera, including wave studies, scenes in Brittany, animal studies, amongst which were "Zoo" pictures, and the climbing dog series, all of which were much admired. Mr. Pierson manipulated his lantern on the occasion, and also contributed a few of his own slides, as did also Mr. Cornell. The chairman brought prints and negatives which were handed round and criticised. Samples of Marion's Britannia plates and Mawson and Swan's pocket diaries were handed round.

**Wakefield.**—A general meeting was held on the 3rd inst., Captain Norwood in the chair, when A. W. Stanfield, Esq., J.P., was unanimously elected President, and J. Briggs, Esq., J.P., and Captain Norwood Vice-Presidents. The following gentlemen were elected to form the Committee, along with the officers of the Society: Messrs. Eldridge, Townend, H. Hall, H. Chaplin, Webster and Williams; Messrs. G. F. Firth and H. A. Halliwell as Hon. Secs., and Mr. Richardson as Hon. Treasurer. The Committee of the School o

Art are willing to find a meeting-room and dark-room for the use of members in their new building, if the authorities at South Kensington give their assent. The subscription for lady and gentleman amateurs or professionals is 4s., and for juniors, 2s. 6d., from now until Oct. 1st, when a new year will commence. The first meeting is to be on April 15th, at 8 p.m., in the Old Town Hall, when an exhibition of lantern-slides will be given.

**Woolwich.**—On the 12th ult. Mr. Calder gave a demonstration on "Lantern Slide Making," successfully exposing and developing a dozen slides, which he distributed amongst the members present; and on Saturday evening, 21st March, a public exhibition of the AMATEUR PHOTOGRAPHER Prize Slides was given in St. Andrew's Hall, Anglesea Hill. The President, Rev. J. W. Horsley, occupied the chair. During the evening a short programme of vocal and instrumental music was ably performed. The high standard of quality of the slides was much appreciated by those present, and especially by the members of the Society. The annual meeting was held on April 9th.

**"Fallowfield's Remembrancer"** for the March quarter keeps up its character for usefulness, and contains several novelties, including the "Parallel Trimmer," referred to in our pages a short time ago. It makes a most useful illustrated catalogue for the amateur, and contains a long list of "job lines," which are being sold off at considerable reductions. We recommend the perusal of it to all who are about to purchase apparatus.

**The "Dutchman."**—The *Boy's Own Paper* for April contains a very interesting article by the Rev. A. H. Malan, M.A., on "Photographing the Dutchman," meaning, of course, the Great Western Railway express train, the Flying Dutchman. The article is illustrated by three process blocks of express engines—"No. 2,001," "The Lord of the Isles," and "Tornado," and a woodcut of an express train going towards Exeter at the rate of fifty miles an hour.

**Eikonogen.**—Eikonogen or amido-B-naphthol-B-monosulphonate of sodium is made according to Dr. Andresen's patent by heating naphthaline with sulphuric acid to 150 degs. The mixture is then poured into twenty times its weight of water, saturated by the addition of chalk, then filtered and precipitated by the addition of carbonate of sodium. On evaporation the crystals of B-naphthol-monosulphonate of sodium are obtained.—*Photographic Gazette*.

## To Correspondents.

THE insertion of **QUERIES AND ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4600. **Watkins' Exposure Meter.**—Would any reader oblige me by saying if a Watkins exposure meter is suitable for timing exposures in carbon printing, and if so, how it is to be used?—R. E. SHAWCROSS.

4601. **Matt-Surface Paper.**—Will some one kindly advise me which is the best matt-surface paper (not platino), and give me a reliable formula for a toning bath, or, if it can be recommended, a toning and

fixing bath in one? I find, with the papers I have tried, that, although I print very deep indeed, by the time the print has got through the toning bath it has lost too much, and becomes practically quite washed out in the fixing. Besides, I can get no tone except a blue purple, which I don't like. All the formula I have seen recommend washing before toning, but I find that I can get a much better tone by omitting the preliminary washing, which seems to take too much out of the prints. Is there any harm in omitting it?—SUTTON.

4602. **Intensification.**—In intensifying, how can a sky be protected from intensification?—HENRY CLARK.

4603. **Hand-Camera.**—Re adapting quarter camera for hand purposes. Will some one say where a suitable case can be had?—I. H. W.

4604. **Winchester, Changing Plates at.**—As I intend having a day's photographing in Winchester, I should like to know if there is a "society's" dark-room or a kindred spirit who would allow me to change my plates.—J. J. T.

4605. **Washing Soda Developer.**—I shall feel much obliged if some reader will give me a reliable formula for developing with soda crystals and dry pyro, my idea being, when from home, to carry a bottle of dry pyro and purchase washing soda in small quantities as I go along.—NOVOCASTRIENSIS.

4606. **Rapidity of Lenses.**—I have a Watson half-plate R.R. lens, 8 in. focus. For taking portraits, should I do better to have a portrait lens, and what beyond rapidity should I gain? How much quicker would lenses working at  $f/4$  and  $f/6$  be than the above-mentioned R.R. lens, supposing all to be of same quality, that is, costing about the same in cash?—ONE YEAR'S AMATEUR.

4607. **Mounting Prints.**—Will some brother amateur kindly tell me how to make a solution for above? I mount mine with starch, but when dry they always curl off. Any hints on the above will be acceptable.—A BEGINNER.

4608. **Card.**—Will some one kindly tell me where thin card may be obtained suitable for mounting wet chloride paper on direct from washing? I wish to finish afterwards on ordinary mounts as usual.—YEAST.

4609. **Matt Varnish.**—How can matt varnish be applied to the glass side of negative without some

**Postal Bromide Club.**—Mr. J. Eaton Fearn, of the *Advertise* office, Utttoxeter, writes to us:—"Will you kindly allow me a little space to inform your readers that I am desirous of starting a post photographic club, devoted to bromide workers and enlargers, and that I shall be very pleased to receive the names of any ladies and gentlemen wishful to join such a club? A special feature of the club will be bromide enlargements. Applications for membership should be accompanied by a specimen bromide print, a stamp enclosed for its return where desired, or for reply. It will save perhaps at the outset to state that only good workers will be accepted. Details of working to be arranged by consensus of opinion, when the desired number of members have been obtained."

**"Wheeler's Bromide Printing Register."**—This is the latest useful little aid to photography issued by Messrs. Geo. Wheeler and Co., of 46, King-street West, Manchester. It is useful for recording exposures of bromide and Alpha papers, lantern slides, etc. Instructions are given "how to print bromide pictures," developing formulae for bromide paper, and instructions how "to paint clouds on negatives," and "to add clouds from another negative." In the Printing Register the following headings are given:—No. of negative or date; Subject; Size of Negative; Distance from Light; Exposure given; Extra Exposure to Sky, etc.; Paper; Developer; Result or notes for future guidance. The book will be found most useful; it is sold for 1s.; by post, 1s. 1d.; neatly bound in cloth, and can be had of our publishers, photographic dealers, or direct from Messrs. Wheeler and Co.

**How to Calculate the Amount of Water to be added to a Liquid to reduce it to a Lower Specific Gravity.**—Subtract the specific gravity of water from the required specific gravity, and the result will be the amount of liquid to be taken. The difference between the specific gravity of the liquid and the required specific gravity represents the amount of water. Example: We have a sample of sulphuric acid, specific gravity 1.845, and it is required to use an acid with a specific gravity of 1.3. How much water must we add to the strong acid to obtain the weak?

$$1.845 - 1 = .845 = \text{the amount of strong acid.}$$

$$1.845 - 1.3 = .545 = \text{ " water.}$$

∴ if we add 545 parts of water to 845 parts of strong sulphuric acid, we shall obtain an acid having a specific gravity of 1.3, or if we add 1 ounce 65 minims (fluid measure) of water to 14 drachms (fluid measure) of strong sulphuric acid, we shall obtain about 23 drachms of sulphuric acid, having a specific gravity of 1.3.

of it getting on to the film side? I apply as ordinary varnish and with the greatest care: cannot avoid some running over on to the film. Sponge or brush does not apply evenly.—POWER.

4610. **Bromide Paper.**—How can you tell the right side from the wrong side of bromide paper, ditto matt sensitised paper?—POWER.

4611. **Madeira, Photographing in.**—Can any reader say if there are any restrictions on photography in the Madeiras, also if any dry plates can be procured there, or use of dark-room for changing? Any hints as to scenery, etc., will be very acceptable to—WESTWOOD.

4612. **Dark Slides.**—Will some one kindly inform me whether metal dark slides are reliable and worth buying, where I can obtain same, and price? Wanted for Lancaster's quarter-plate Instantograph. DRUM.

4613. **Barmouth and Neighbourhood.**—What places are most worth visiting with the camera during a week's stay at Barmouth? Is a dark-room available in that town?—G. W. B.

4614. **Eau de Javelle.**—On April 6th I took two photographs, developed one with pyro, the other hydroquinone. Both appeared very good negatives. Living in the country and having no constant supply of water I tried eliminating the hypo by Eau de Javelle. Result, the whole image eliminated and two pieces of clear glass remain. Where lies the fault? Formula as in "British Journal Photographic Almanack."—CLERICUS.

4615. **Shutter.**—I have a Kershaw shutter with pinholes in the blind. Will some one please tell me how to make or where to buy solution to re-coat it with?—SHUTTER.

4616. **Stops for Lenses.**—Having lost the stops for the following lenses, viz., Dallmeyer's Triplet, for half-plate, and also for his stereo double combination lenses of  $3\frac{1}{4}$  in. focus, I shall be obliged if any of your contributors can give me the diameters, that I may make new stops, or tell me how to calculate what they should be?—STOPS.

## QUERIES UNANSWERED.

April 3.—Nos. 4588, 4589, 4593, 4594, 4595, 4597, 4598, 4599.

## ANSWERS.

4582. **Bath, Dark-Room and Scenery at—**"Progress" will find that the most artistic bits in the neighbourhood of Bath are on the river Avon near Bathampton, and at Saltford. Also some good views at St. Catharine's Glen and in Newton St. Loe Park. As to dark-rooms, try Yabeley (dealer), or Walker (photographic chemist), Keynsham.—O. H. OXFORD.

4590. **Pinholes.**—Spot out with a fine water colour brush charged with some transparent non-actinic colour, say, crimson lake or gamboge, or even a mixture. The colour must be used almost dry, or it will settle in a circle round the spot, leaving the place it is intended to cover bare.—WIZARD.

4591. **Dark Slides.**—James Thomson, Lintmill, Portgordon, will supply wood ready grooved for slides, also hinged shutters for same.—JAMES WOOD.

4592. **Developer for Hand-Cameras.**—I fancy "Lensigraph" will find the following work well:

Ammonia (liquid) ... 1 oz.  
Potassium bromide ... 2 dr.  
Distilled water ... 1 oz.

To develop, 3 gr. dry pyro are diluted with 2 oz. of distilled water, and about 8 to 10 drops of the above added. Full density may afterwards be attained by the addition of a few drops of ammonia ("880"). Or a good eikonogen developer is:

(A)  
Eikonogen ... 23 gr.  
Sulphite of soda ... 5 dr.  
Distilled water, to make ... 10 oz.

(B)  
Carbonate of potash ... 2 oz.  
Distilled water, to make ... 10 "  
For development, use A and B in equal parts.—WIZARD.

4597. **Prints Curling.**—I do not know of any remedy for this, but have found that if mounted on some thin backing, such as thin white wrapping paper (tested for acidity), the tendency to curl and crack is considerably lessened. Some papers are more liable to curl than others, which is perhaps accounted for by a difference in albumenising.—WIZARD.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING's post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT.

**NOTE.**—In this column we cannot advise upon purchase of APPARATUS, PLATES, PAPER, or PHOTOGRAPHIC MATERIALS.

Advice will be given upon questions of "Photographic Procedure," negatives and prints will be criticised, and every help given to the worker in photography.

**T. HALL.**—(1) Your best plan would be to develop a plate till it shows quite dark all over except the white spots, if you like to expose a couple of plates and forward them to us, we will develop and send you one fixed and one unfixed plate, to show you just how far to develop. (2) The cause of some negatives taking longer than others to print is due either to some being denser than others or to the colour of some being more yellow than others. (3) When you can see the outline of the negative image against the white paper, probably the plate is insufficiently developed. (4) We are afraid we can hardly put the answer into words; the only thing to do is to see a good negative.

**TONER.**—(1) Although some gold may be deposited, the chances are that there is always some gold in solution which may be further utilised by adding fresh gold. (2) Chloride of gold was first added to the salting of albumenised paper by Hennan, and has been occasionally used without ever coming into general practice.

**ESBROS.**—We should say that the mountant in question is a capital thing to cause fading. Do not use it. The toning bath in question requires saturating with chloride of silver before it will tone. Have you done this?

**P. S. ABERY.**—The rust is probably the cause of the stain, though it would be decidedly advisable to fix longer and wash more. We are afraid your work is hardly up to competition standard yet, though the samples of your work sent may not be the best you have.

**MRS. E. CULVERHOUSE.**—We have received your letter regarding the "Seven Ages of Man," and will give it our consideration. Please accept our thanks **T. W. W. MELBUSH.**—Shall be very pleased to make your acquaintance when you are in London. Will you kindly advise the day you are likely to call upon us, to ensure our being at home?

**F. H. J. REUL.**—Lens received; will forward with report in due course.

**PENDRAGON.**—(1 or 2) Either will answer your purpose. (3) The "Amateur Photographers' Annual"

will be found a most useful book for you to refer to. **STANLEY L. WELTON.**—Certainly do not leave the prints in the toning bath.

**MRS. CLASBY.**—The lens has been sent on approval and duly acknowledged.

**R. S. TRESILIAN.**—The work is progressing, but it will be a week or two before the prints are returned. We thank you for your good opinion of the "Amateur Photographers' Annual."

**REV. G. F. WILLS.**—You can have the "Monthly Competition slides" down if you like conditions:—A packing fee of one shilling, and payment of carriage both ways.

**A. T. NEWINGTON.**—Negative reached us safely. We note your suggestion as to size of plate used, and will, as far as possible, give the size. You might send a few lines descriptive of the scene of your picture, to incorporate with our comments in the Report.

**C. W. BASSANO.**—Your print will quite fulfil the conditions of the last competition.

**RINGROSE ATKINS.**—See our reply to Rev. G. W. Willis, and please let us know which set you would like to have sent.

**J. B. KING.**—No Society nearer than the West London. Write the Secretary, Mr. H. Selby, 42, Ladbroke Grove Road, S.W.

**JAMES WOOD.**—Glad to know that you have such a good opinion of our "Annual." Thousands have been sold!!!

**B. TYDEMAN.**—Many thanks for your letter, which you will note our publishers have made use of.

**A TWO YEARS' SUBSCRIBER.**—There is a Society at Tooting; the Secretary is Mr. G. H. Dollery, Ivythorpe, Vant Road, Tooting; and another at Wimbledon; Secretary, the Rev. H. G. Allfree, 28, King's Road, South Wimbledon.

**A. BACKHOUSE.**—We hope to insert what you want in a week or so; pressure on our space has only prevented us from doing so before.

**F. C. KERDEL.**—We should have been inclined to make your sitters prop one another up, as now they give one a curiously unsafe idea. The plate is well exposed and print well printed and toned.

**MONA.**—The prints are good studies of pretty little bits, and one at least would be much improved by the absence of the human figure, which is quite out of keeping.

**H. F. LINGING.**—(1) It is very questionable, but undoubtedly sulphite was first used as a preservative only, but negatives undoubtedly have a special character when developed with sulphite, which is rather inclined to clear glass shadows. (2) Just the same results can be obtained without it. (3) The meta salt is the more powerful preservative, and may tend to keep back the detail in the shadows if too much is used. (4) The idea of using the ammonia and bromide is to prevent fog, and the developer in question gives very soft delicate results, which is probably why the gentleman you name uses it. Your paper to hand; we will try it and let you have the results.

## Quarterly Examinations in Photography.

## QUESTIONS.

- What is the optical centre of a lens, and how would you determine the position of the same?
- Write a brief note on pinhole photography, and how would you determine the diameter of the hole for a given plate and distance?
- Forward a print from a cloud negative, and state (a) the position of sun with regard to the camera, (b) time of day, (c) method of obtaining the negative.

(Latest Day for Answers—April 20th.)

## RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photo-

graphic matters and contributors to the photographic journals will not be allowed to compete.

**NOTE.**—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"

AMATEUR PHOTOGRAPHER,

1, CREED LANE,  
LONDON, E.C.

## Monthly Competition.

## XXIII.—INLAND SCENERY.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. **Halfpenny Stamps preferred.** A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits** for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

**Advertisements** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

**Backgrounds.**—Six backgrounds in flatted oils, on linen and rollers, new and perfect, work of advertiser during dull business, river scene, cottage doorway, mansion grounds, garden scene, and two interiors, size 8 ft. by 6 ft. 6 in.; price 12s. 6d. each, bargains; price no criterion; photographs forwarded. — William Hare, Photographer, Sutton, Surrey.

**Bicycles.**—Cushion tyre Safety, just new, cost £14, balls everywhere; £7 10s.; approval. — T. Dereham Road, Norwich.

**Psycho Safety,** ball bearings all over, except head, nickel-plated parts, Bowin's adjustable pedals, in splendid condition; cost 19 guineas; price £9; apply by letter for appointment. — Psycho, Hawthorne Cottage, Upper Sydenham.

**Burnisher, etc.**—Marion's cabinet burnisher, cost 30s., price 15s.; or exchange Thornton-Pickard 2½ in. time shutter. — Miller, 23, Highbury Grove, Islington, London.

**Camera, etc.**—Fine half-plate camera, 3 backs, equal new; 75s.—14, Melville Street, Ryde.

**Camera,** half-plate, new, reversing and swing-back, with compound front, one double dark-slide; what offer for cash?—Head, 30, Chapel Road, West Norwood.

**Quarter-plate square camera,** long focus, every movement, three double backs, Lancaster's International stand; 27s. 6d.; approval. — Morse, 7, Baldwin's Place, Gray's Inn Road.

**Quarter-plate portable camera** (by Hare), with changing box, carrying twelve plates, nearly new. — A. Elliott, Holme Lodge, Hereford.

**Lancaster's quarter-plate Instantograph,** fitted in case as hand-camera, can be used with or without case, complete with four metal slides, tripod, finder, etc.; £2; canvas camera case, quarter, 3s.; Tyler's syphon washer, 4s.; Kershaw shutter, quarter, 10s. — Hancock, 5, New Porter Street, Sheffield.

**Cameras, Lenses, etc.**—Instantograph, quarter-plate, 1890 pattern, good condition, lens, shutter, dark-slide and stand, case with strap; 33s.—No. 133, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Camera,** quarter-plate, lens, dark-slide, and stand, complete, quite new; only 14s. 6d.—No. 134, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Watson's half-plate Light Premier camera,** three double dark slides, all brass bound, Ross's 8 by 5 symmetrical lens, solid leather case, with folding tripod, bought last year, cost £19, perfect condition, £12.—Mrs. Dowell, Larkhill Terrace, Blackburn.

**Whole-plate bellows camera,** will extend 2 ft. for copying, square reversible swing-back, three double slides, with half and quarter plate holders, lens, stops, cap, pneumatic shutter, Kennet stand, printing frame, two celluloid dishes, almost new; the lot £10.—L. C., 12, Courthouse Road, London, N.W.

**Whole-plate Stereoscopic Co.'s best light camera,** every movement, three double backs, Optimus 9 by 7 R.S. and W.A. lenses, pneumatic shutter, focus-

sing cloth, tripod, solid leather case, equal new; cost £28 10s. 6d.; price £17 10s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

**Half-plate Instantograph camera,** three double backs, tripod, Dallmeyer's R.R. lens, complete in case; £3.—Robt. Woolman, Stockton-on-Tees.

**7 by 5 box camera,** stand, quarter-plate lens, complete, chance for beginner; 10s.—Mace, Garden Cottage, Cheltenham.

**Tourist whole-plate camera,** all movements, three double backs, R.R. lens, in solid leather case, lock and key, best ash sliding stand, all in good condition, price £7; 5 by 4 bellows camera, four solid backs, view lens, 3-fold stand, fitted into mahogany case, price 59s.—Lewis, 35, Broad Street, Reading.

**Half-plate camera,** mahogany, waterproof, extending bellows body, with achromatic single lens for portraits or landscapes, with stops and cap, removable hood, and double dark-slide, with folding back, carrier to fit quarter-plates, with folding tripod stand, complete; price 34s.; carriage paid.—E. Irwin A. Mills, 35, Manchester Road, Rochdale.

**Collins' Pocket cameras** in cases, 5 by 4 and quarter-plate, each with six double backs, also fixed focus hand cameras, working with above backs, Ross' lenses, Nos. 2 and 3, portable and Shew's Eclipse, above equal to new; no approval.—Mr. H. Miles, 19, Kensington Crescent, W.

**9 by 7 studio camera,** dark-slide, and carriers, good portrait lens, oak studio stand; 40s.; call any evening.—Davis, 6, Lethian Road, North Brixton.

**Coil, etc.**—Large induction coil, 2 in. spark, commutator, cost £6; 4-cell bichromate battery, new, cost £2. Wanted, good camera, or cash offers.—190, Heyside, Royton.

**Developer.**—An amateur, who has first-class developer for hand-camera work, will send formula for six stamps. — J. Brown, 139, Queen's Road, Bayswater.

**Hand-Cameras, etc.**—Adams' Ideal, one movement; specimens free; offers? — A. H. Short, 16, Perryn Road, Acton.

**Gentleman** will let his No. 3 Kodak on hire, if value is deposited with Editor; terms according to length of time required; no cards.—Toulmin, Braeside, Sunninghill, Berks.

**Hand camera,** takes 14 quarter-plates, almost new, cash 45s.; also Presto hand-camera, three dark-slides, chemicals, etc., 10s. 6d., or the lot 50s.—Digan, 123, St. Mark's Road, Notting Hill, W.

**On sale, half-price,** Turnbull's hand-camera, perfect.—Longden, Wharfedale Chambers, Sheffield.

**Hand-camera,** made to order, 15 quarter-plates, focus every picture if necessary, no dark-slides, f/6, worth £10; only £5 10s.; can be seen any evening.—52, Jermingham Road, New Cross.

**Optimus Magazine quarter hand-camera,** nearly new; cost £6 6s.; price £4 4s.—J. M. Turnbull, Rose Street, Edinburgh.

**Franks' Presto detective hand-camera,** lens, slide, developing and fixing solutions; price 6s.—L. Bagshaw, Union Street, Doncaster.

**Lancaster's Omnigraph detective,** best leather, quite new; 21s.—170, High Street, Rimgate.

**Lancaster's detective, quarter-plate,** covered morocco, with extra changing box; cost, last August, £4 12s. 6d.; price £2 10s.—J. Williamson, 14, Church Road, Hove, Brighton.

**Lenses, etc.**—Great bargain, 7 by 5 rapid rectilinear lens, f/8, Waterhouse stops, as new, for 19s. 6d.—91, Slad Road, Stroud, Glos.

**Wide-angle rectilinear (Steinhilber),** 5 in. focus, 50s.; pair of Grubb's single, 6 in., matched for stereoscopic work, 60s.—G. M. Iliff, 11, Martineau Street, Birmingham.

**Perken, Son, and Rayment's Optimus Euryscope lens,** 7 by 5; list 94s. 6d.; highest cash offer accepted; not used half a dozen times.—Whitham, 6, Whalley Range, Padham, Lancashire.

**A c.d.v. lens** (by Ross), £3 3s.; also Lancaster's half R.R. lens, iris diaphragm, £2; approval; deposit.—Clarke, Dentist, Louth, Lincs.

**9 by 7 rapid view lens,** best quality, conical mount, Waterhouse diaphragms, 21s.; rigid sliding-leg tripod, 8s. 6d.—Setacci, 41, Waldemar Avenue, Fulham.

**5 by 4 rectilinear,** wide-angle, splendid lenses; 13s. 6d. each.—D. Hall, Pinfold Lane, Lancaster.

**Lancaster's single wide-angle lens,** half-plate, 9s.; Jeffries' half-plate washer, 7s. 6d.; Vevers' 7s. 6d. burnisher, 4s.; Abney's 2s. 6d. book on silver printing, for 1s. 6d.; all good as new.—E. Avery, 59, Dock Street, Newport, Mon.

**Lenses for sale,** Ross's 5 by 5 R.S., £3 10s.; Wray's 5 by 4 W.A. rectilinear, £3; Wray's 8½ by 6½ landscape, 32s. 6d.; also Kershaw shutter, whole-plate, 15s.; all in first-class condition.—W. Milburn, Brunswick Street, Carlisle.

**Suter's 8½ by 6½ single landscape lens;** £2.—A. Parkes, Ardllea, Dundrum, Dublin.

**Ross No. 5 portable symmetrical lens,** scarcely used; 75s.—Acworth, Sheldmoor, Brondesbury.

**Lancaster's half-plate Rectigraph lens;** price 33s.; deposit.—A. Huddart, Eskdale, Carnforth.

**Lancaster's Special Instantograph lens,** See-saw shutter fitted, new, suit hand-camera, 12s. 6d.; L'Automatique shutter, 12s.; Dallmeyer's whole

plate R.R., 95s.; excellent R.R., 18 by 15, 27 in. focus, 155s.—Hutchings, Hairdresser, Baling Dean Optimus 5 by 4, with diaphragms, excellent; 21s.—14, Melville Street, Ryde.

**Sets.**—Watson's half-plate Acme camera, turntable tripod, brass-bound, Eastman's roll-holder, specially fitted with mahogany shutter, portable symmetrical lens, travelling case, £15; also Luzo detective camera, square pictures, £2 10s.; Lancaster's 12 by 10 enlarging camera, £1; or, together, £3.—E. A. Walker, 102, Lexham Gardens, London.

**Optimus long-extension half-plate camera,** square, with three double dark-slides, Optimus rapid rectilinear lens, 7 by 5, carrying bag, tripod, lamp, zinc washer, nearly new; offers; approval.—H., 11, Lyon Street, Tynemouth.

**Lancaster's quarter-plate Instantograph,** with patent adjustable diaphragms and instantaneous shutter, only used few times, with universal 3-fold stand, two mahogany and three Tyler's double slides; buying half-plate; price £5.—Naylor, 77, Cadogan Square, S.W.

**Slab.**—Glass slab, 34 in. by 28 in., ¼ in. thick; offer wanted.—Ellesmere House, Patricroft.

**Sundries.**—The whole contents of amateur photographic studio, coming down for street improvements, to be sold at half original cost. A 12 by 19 square long-focus camera, two double backs, £5 15s.; a 19 by 8 conic leather bellows camera, 3 double backs, turntables, and all movements, £5 15s. 6d.; half-plate conical leather bellows camera, 3 double backs, £2 15s.; four tripods, six lenses, hot rolling press, 15 in. silver-plated rollers, carved oak chair, swing backgrounds, a mahogany enlarging lantern, 7 in. condensers, and a large quantity of sundries; the whole in first-rate condition, and will be sent on approval; deposit only; write for list.—J. Wm. Heaton, 29, Scott Street, Keighley.

**Will exchange pair young thoroughbred tumblers for complete 1890 AMATEUR PHOTOGRAPHER.** — K. Smith, Hamper Hill, Watford.

**Cassell's "British Battles,"** four vols., unbound, 20s.; Stirn's Vest camera, 13s. 6d. Wanted, three half-plate metal slides for Lancaster's Instantograph.—Robert Hamilton, Ladeside Street, Strathaven, Scotland.

**Violin, etc.**—Valuable bargain. Fine mellow-toned violin, in perfect preservation, suit lady or gentleman for orchestral or solo playing, complete with bow, balza-lined case, and accessories; take 15s. 6d. for the lot; violin alone worth double; money willingly returned if not approved. About 20s. worth of unsold music given in free.—Mrs. Graham, College Buildings, Ipswich.

**Washer, etc.**—Large printing washing tank, about 1 ft. 8 in. by 1 ft. 6 in. by 1 ft. 6 in., with spray and perforated tray (by Marion), in good working order; also Oules' retouching desk (by Marion), scarcely used; what offers? — L. H. Legg, 65, Shooter's Hill Road, B'ackhatch, S.E.

## WANTED.

**Book.**—Robinson's book about the studio.—T. W. Milburn, Battle Hill, Hexham.

**Cameras, etc.**—Second-hand half-plate camera, complete, cheap, good condition.—Particulars to H. Grut, 262, Fenton Place, Newington, London.

**Lancaster's old-pattern Instantograph,** half or whole plate, cheap.—Cain, 2, Orisdale Terrace, Cheltenham.

**Lancaster's or other make half bellows camera and slides,** without lens.—M., 367, Euston Road.

**Cameras, Lenses, etc.**—Good quarter-plate camera and lens; exchange Jubilee envelopes.—Turner, Woodville, Lytham.

**Camera,** three wooden dark-slides, tripod, and wide-angle Rectigraph lens, on approval; will give new hand-camera, or violin and box, etc., and cash.—Jackson, 12, Oldham Road, Failsworth, Manchester.

**Lancaster's 5 by 4 Instantograph camera,** in good condition, with or without lens; approval; cheap.—Robert Banks, Eastlaw, Eccles, Manchester.

**Camera Case.**—Strong leather camera case, half-plate, cheap.—Liversedge, 90, Selborne Street, Liverpool.

**Hand Cameras, etc.**—Swinden and Earp's 5 by 4 detective, No. 4 Kodak, regular or junior; also second-hand lantern slides, sets, stories, etc.—W. V. Morris, Parade, Cork.

**No. 2 or 3 Kodak.**—Particulars and condition to B., 1, Dermody Road, Eastdown, Lewisham, S.E.

**Lenses, etc.**—Good quick-acting cabinet portrait lens, in exchange for Dunkley's 7 guinea reversible handle perambulator, or nearly new lady's gold watch.—Particulars of Cox, Swanley.

**Pair of 4½ in. or 5 in. stereoscopic lenses,** by first-class maker; approval.—A. Huddart, Eusdale via Carnforth.

**Lens, 9 by 7 doublet,** lowest price; state maker.—Duke's, Llangadock, South Wales.

**Roll Holder.**—Eastman's quarter roll-holder.—Longden, Wharfedale Chambers, Sheffield.

**Set.**—Good half or whole set; exchange Facila hand-camera, new, cost 84s.—King, 521, Harrow Road, W.

# McKELLEN'S CAMERAS.

DIRECT FROM MAKER TO USER.

To users of Photo Instruments I will allow a discount of TWENTY PER CENT. for Cash with order OFF McKellen's Photographic Specialities, except the "Detector," from which only 10 per cent. will be allowed.

"Cauldon Place, Long Row, Nottingham, Feb. 27th, 1891.

Sir,—The Camera, etc., came safely to hand this morning. I am very pleased with the improvements made in it since I had my 10 by 8, and I shall find them particularly useful in making architectural studies.

Yours very truly, ARTHUR MARSHALL."

"67, St. Andrew Street, Cambridge, Feb. 27th, 1891.

Dear Sir,—I am very pleased with all the goods you sent me, and will certainly apply to you again if I should ever want anything else in the same line.

Yours truly, W. FAWSSETT."

Place your orders promptly to secure early delivery.

THE "Quarterly Examinations" have given great satisfaction. They are really examinations, and those who enter have practical work, and cannot take their answers from text-books. One student writes:—"Allow me to thank you very much for undertaking this work; it is a step in the right direction. I have learnt a lot, as no doubt my brother competitors have done, from taking part in it. I hope those who can spare time will enter." The winner of the first prize, Mr. L. A. Burrow, selected a 7 by 5 Optimus R. R. lens; the winner of the second prize, Mr. H. Leach, a sundry lot, including Thomas's and Mawson and Swan's plates, Fry's bromide paper, Obernetter paper, chloride of gold, a copy of "AMATEUR PHOTOGRAPHER'S Annual" and "Competitive Papers on Photography." The winner of the third prize has not yet advised us of his wishes.

From the note in last week's issue, it will be seen that the AMATEUR PHOTOGRAPHER "Quarterly Examinations" require steady, sober study and application. The scheme for the current quarter is extensive, and will cover a great deal of very interesting work. We shall be glad to receive the names of intending students, and hope many will be induced to enter for these examinations.

In another column we announce that entry forms are now ready for the following competitions:—

"Photography at Home" .. June 30.

"Public Schools Competition" .. June 17.

"Ladies' Second Competition" .. Aug. 22.

These entry forms will be sent on receipt of stamped addressed envelope. In connection with the "Public Schools" we may add that we shall be pleased to send entry forms to any head-master of schools where the boys (under seventeen) go in for photography. The conditions are not stringent, and we hope the boys will compete in large numbers.

Last year we had a most successful "Ladies' Photographic Competition," and we hope that many of the ladies who enter our "Monthly Competitions," and who send us very capital work, will contribute to the AMATEUR PHOTOGRAPHER Ladies' Second Photographic Competition. We shall hope to be able to arrange for the prize photographs to be reproduced in one or other of the excellent ladies' papers that are now published. It will be remembered that last year the *Lady's Pictorial* was good enough to devote several pages to our competition.

MUCH interest is being taken, as will be noted by our correspondence columns, in the matter of "the explosion of a regulator on an oxygen cylinder." We cannot pretend to clear the matter up, but certainly agree with Mr. Hodges that it is a matter of such importance that those interested, and there are very many, should meet and discuss the matter, after having inspected the damaged regulator. We shall be glad to give the use of one of our rooms for the purpose, if it be thought desirable.

THE second triennial photographic exhibition of the Gloucestershire Photographic Society will be opened at Gloucester on the 20th inst. We understand that there will be an excellent show of photographs. Every evening lantern demonstrations will be given, the demonstrators being Messrs. Paul Lange, W. D. Welford, Charles W. Hastings, G. Embrey, and T. M. Brownrigg. The society's silver and bronze medals will be placed at the disposal of the Judges, Messrs. H. P. Robinson, V. Blanchard, and E. Brightman.

THE Crystal Palace Photographic Exhibition will by the time this paper is in our subscribers' hands be in full swing. Some delay has been caused through the transmission of

photographs from Liverpool. There are a splendid collection of pictures, and a very good show of apparatus, notwithstanding that a section of the photographic trade have chosen to stand aloof and refuse the invitation of the Crystal Palace Company. We are glad to see such thoroughly representative firms as Messrs. Watson and Sons, Geo. Houghton and Sons, D. Noakes and Sons, etc., have extensive stalls. The Crystal Palace Photographic Exhibition should be, in apparatus, as it is in photographs and lantern-slides, the show of the year. The arrangements for the lantern shows are most perfect. Some splendid collections of slides have been received from all parts of the kingdom, and very fine exhibitions will result. The lantern has been specially built from Mr. S. G. B. Wollaston's specifications, and the lenses by Messrs. Taylor, Taylor, and Hobson are, we understand, most perfect. For ourselves, we shall look with pleasure upon the success which must attend the Crystal Palace Exhibition, and we can only regret that a few of the leading firms of apparatus manufacturers and dealers should have thought fit to abstain from exhibiting. The same action was taken by leading firms in the cycle trade upon the occasion of the last Stanley Show, with the result that many small firms exhibited and took large orders, and, in fact, established their business through the absence of better known firms. Next week we shall be in a position to commence our review of both pictures and apparatus. In the meantime we may assure our readers that if they visit the Palace they will have no cause for regret, and, in fact, will find a most excellent collection of photographs by both amateurs and professionals.

THE portrait of Thomas Carlyle, which has just been purchased by the Glasgow Corporation for one thousand guineas, is well worth a visit at the Goupil Gallery. Mr. Whistler has attained a high success in this portrait of the sage of Chelsea. He is seated with his hat on his knee, and his hands resting on a stick. The loving care bestowed by Mr. Whistler on this painting has met with the widest appreciation from those who saw Thomas Carlyle deep in thought. The Glasgow Corporation is to be congratulated on its public spirit in procuring such a valuable picture, which redounds to the credit of its talented artist.

MANY of our subscribers resident in London and the suburbs have possibly not had an opportunity of seeing the AMATEUR PHOTOGRAPHER 1890 Prize Lantern Slides. We have pleasure in stating that they will be shown on Monday evening, the 27th inst., at our offices, 1, Creed Lane, Ludgate Hill, commencing at seven p.m. There will be no charge for admission; the exhibition will be open to all on presentation of visiting card. The first part of the evening will be devoted to the showing of the slides contributed to the last Monthly Lantern Slide Competition this season—"Architecture, Interior and Exterior." We hope there will be a large attendance. Next season we shall arrange to have once a month, a photographic evening, the first part to be taken up with a demonstration upon any new process in photography, and the second part to an exhibition of lantern slides; at the same time the Monthly Competition prints will be on show. We hope by this means to be in more personal touch with, certainly, our metropolitan subscribers. The "Monday afternoons" have become exceedingly popular, and the members of our staff are delighted to welcome those who require assistance or advice upon photographic manipulation and procedure, and to give every help to the worker in photography.

THE Camera Club Conference closed on Wednesday with

a dinner at the "Criterion," under the presidency of Capt. Abney. At the meeting at the Society of Arts, the chief paper was one by Major Nott on "Photography and Illustrated Journalism," in which the reader contended that photographs of historical events were likely to be of more interest than sketches by artists, as they would be absolute records of the facts untainted by any feeling on the part of the photographer, whilst the artist would probably strive after artistic effect rather than historic accuracy. Mr. Sutton's paper on "A New Process of Making Photo-mechanical Blocks" was of some interest to those who like to experiment in the direction of mechanically photographing their own pictures, the plant required not being prohibitive. The other papers, by Professors C. V. Boys and Minchin, were clever and interesting, as was also Mr. Elder's communication with respect to Mr. Carey Lea's new allotropic forms of silver.

MR. LOUIS MELDON and Mr. T. White gave an exhibition of their lantern slides before the Ohne Host Cycling Club, Dublin, on the 7th and 8th inst. Many slides of instantaneous pictures of sporting events, etc., were shown, and great admiration was freely expressed for the work of both exhibitors.

WE notice that Miss Balfour, sister of the Chief Secretary for Ireland, has been using the camera in the course of her tour with Lady Zetland through the congested districts of Ireland. The views will be very interesting, and will have some political importance in the near future, when, no doubt, many persons will have the opportunity of seeing prints from them.

### HOME PORTRAITURE.

ONE of the greatest faults in amateur portraiture is the use of the doublet or rapid rectilinear lens. This is a statement that will surprise many who read it; still it is, we think, none the less true. The rectilinear lens has such a depth of focus and cuts so sharply that we lose that softness and roundness which is obtained by the use of the portrait lens, and it is difficult to compensate for this by any system of throwing the image out of focus; and the rectilinear lens has such an enormous width of angle that we have to get so near the object to obtain an image of any size, that we have consequently an increase of focal length and diminution of ratio aperture, which makes our lens abnormally slow. We may use either a portrait lens or, as these when of good quality run into a heap of money, we may get the next best lens for portraiture, and that is the single lens of fairly long focus, working at rather a larger aperture than usual, viz.,  $f/8$ . There is sufficient spherical aberration present with such an aperture as a rule as to have no baneful influence and yet give us roundness and softness. Personally we have rigged up a compromise, and that is as follows. We managed to get hold of some unmounted single or meniscus landscape lenses, and we use these in a mount specially made for us, and we are thus able by a little calculation to obtain any focal length and any ratio aperture we want. The lenses are of 22, 18, 16, 13, 10, and 8 ins. focus respectively. We had a tube of brass made with a cell to fit in each end; into these cells we can slip any one of the above lenses, and a ring of brass keeps the lens in its place. The tube is  $2\frac{1}{2}$  ins. long, and the cells screw in till there is only two inches between the inner surfaces of the lenses. The diaphragm slot is just midway. Now according to the well-known rule, multiply the foci of the two combinations together, and divide by the sum obtained by adding them together and subtracting the distance of separation, it is

quite possible to reckon out any focus we like. Let us take, for instance, the 22 and 18 in. lenses— $22 \times 18 \div [(22 + 18) - 2] = 396 \div 38 = 10\frac{1}{2}$  focal length. Now the full aperture of our lens is  $1\frac{1}{8}$ , therefore we get a focal length of  $10\frac{1}{2}$  ins. and a ratio aperture of  $f/6.5$ , at which there is sufficient outstanding spherical aberration to give us softness. Or we may use the 18 and 16 ins. lenses, and then we get  $18 \times 16 \div [(18 + 16) - 2] = 288 \div 32 = 9$ , and the aperture will then be  $f/4.8$ , and we must, or may, stop down with advantage; or, if we take the two extremes, we get  $22 \times 8 \div [(22 + 8) - 2] = 176 \div 28 = 6.3$ , and we get an aperture of  $f/3.9$ , which requires a good deal of stopping down. This arrangement is not optically and scientifically perfect, but at any rate it will just do what we want it to, and we have a very convenient and efficient combination lens with which we can obtain any focal length, and consequently any sized image, so that we can actually work our lens at any aperture we like without having to get too near the sitter, and thus decrease the ratio aperture.

The next point to consider is the camera and tripod. This may be the ordinary one we are always in the habit of using; but if we want to avoid any outcry we had better shoe the tripod points with bits of cork to prevent damage to carpets, etc. A swing-back is extremely convenient here. No other point in the camera or its appurtenances requires notice.

The next important consideration is the plate. This is always a burning question, and our advice is to use as sensitive a plate as you can get hold of, isochromatic, orthochromatic, or colour sensitive, commercial or home prepared, in preference, because there is less work for re-touching; freckles, and sallow skins, and yellowish lighting have, therefore, less influence. We prefer personally a bromo-iodide plate, and always give as long an exposure as we possibly can without allowing the sitter to obviously move, and for this reason keep our eye on the sitter, and have the lens cap ready to clap on the instant we note a tremor. The developer we use is eikonogen with hydroquinone, but at present we have only considered the necessary appliances, and consequently the development takes a later place.

### ENGLISH v. GERMAN PLATES.

WE are so accustomed now to see things of all kinds branded with the words "made in Germany," that one sometimes wonders whether anything is ever made in England, except, perhaps, a few political fiascos and verbose speeches in the House of Commons, so that it is really refreshing to find a very high compliment paid to the makers of English dry plates by photographers abroad. In the *Photographische Mittheilungen* for April 1st there is an extract from a letter from a German doctor to a professor in Berlin, which we translate for the benefit of our readers: "I have been in Colombo, Madras, Hyderabad, Puna. Above all also here, I have met with German photographers, who permitted me, in the most friendly manner, to use their dark-rooms, without anywhere being willing to take any remuneration for the same. It was sufficient that I represented myself as a German amateur. Where I desired it, the developer even was placed at my service gratis. At the most I ought to give a gratuity to the assistant where there was one. The gentlemen were . . . all Germans—well-disposed Germans—working exclusively with English plates. All declared that they would rather obtain their plates from Germany, if the German plates were anything like equal to the English. Not one of these gentlemen uses ice; some work even without an alum bath, even in the hot season (most with the pyrogallol developer). The English plates stand such treatment, keep their sensitiveness, probably for years, at any rate more than one year. German plates give

foggy pictures even after a few months, become always more insensitive and worse. All require an alum bath, and will not even then stand in the hot, rainy season long washing." Dr. Vogel, in an editorial note, says, "We know that English plate makers add chrome alum, before coating, to the emulsion destined for India, in order to harden it. We know further that they in England send premeditatedly there less sensitive plates; further, that they always recommend the pyro developer, because this somewhat hardens the plates."

Although we have a very great respect for the opinion of such an authority as Professor Dr. H. W. Vogel, we think that in this case he has spoken without serious consideration and with the bias of a defending counsel. It has been our experience to forward numerous lots of plates of several different makers to friends in India, and the only precaution taken by the makers is to see that the plates were properly packed in zinc-lined cases. Not content with this, however, we communicated with two of the largest manufacturers of English plates, and their replies in both cases bear out the result of our experience. That our English makers specially coat plates for India is absurd on the face of it, as some makers actually receive an order which has to be immediately packed and dispatched to the docks in order to catch a certain steamer. That they send out there plates of lower sensitiveness we know to be untrue from several communications from our correspondents. Further, that the pyro developer is recommended because it has a tendency to harden the film is equally absurd, as pyro has been the developer recommended almost from the very first introduction of gelatine dry-plates.

**"Sans Egal" Paper.**—We have recently received from the London Sensitised Paper Co., of 46, Lawford Road, Camden Town, N.W., a sample of their sensitised albumenised paper, which they guarantee was sensitised five months before it was sent to us. That being so, all we can say is that it keeps remarkably well, for on putting it in the printing frame we found that it printed very rapidly, and toned with ease in the ordinary toning bath, and was in no way deteriorated by having been kept. It is well worth trial.

**St. Petersburg Photographic Exhibition.**—The *Daily News* says:—Though the photographic exhibition is confined to the Russian Empire, the best exhibits, writes our correspondent, are of English goods. This is notably the case with cameras and apparatus. One interesting exhibit is a large series of views taken by the brothers Groum Greshemailo in their recent journey in the Thian Shan and in Chinese Turkestan, and alongside is the camera by which they were taken, and it is of London manufacture. As for the views, enlargements, transparencies, they are fully up to the standard of such exhibits in England, but they show what a great field there is in the Russian empire for the photographer.

**Reproduction.**—As many of our readers are interested in the reproduction of photographs, we cut the following list from the *Lithographic Art Journal*:—

Tissierography.	Heliotype.	Albortype.
Zincography.	Heliocromotype.	Typochrome.
Paniconography (or	Helioglypty.	Collotype.
gillottage, after the	Phototype.	Autotype.
name of its inventor,	Hélioplanography.	Diaphanotype.
Gillot).	Photoglyptie.	Chrysogyp.
Photogravure.	Phototypography.	Gelatinography.
Photozincography.	Photochrome.	Téténotype.
Heliogravure.	Pantotype.	Lencography.
Heligraphy.	Woodburytype.	Chaotype, &c.
	Panotype.	

**A New Focussing Cloth.**—There has always been room for improvement in the focussing cloth, and Mr. T. Manson, of 37, Highgate, Kendal, has certainly invented one of an entirely novel form. This he calls the "Sensible." It is bag-shaped, and covers the camera completely, with the exception of the lens, and a space left in the underside for the tripod screw. The mouth of the bag is, of course, open, and is large enough to admit the head and one arm to rack out the camera. Being well made and of black twill, it is quite impervious to light. It is the most perfect focussing cloth that could be conceived, and we are quite sure that, at 3s. each (half-plate size), Mr. Manson will have an enormous sale. The cloth is a protection to the camera and to the dark slides, and when travelling, the whole can be packed in it and so protect both.

## Letters to the Editor.

### PHOTOGRAPHY IN NATURAL COLOURS.

SIR,—Surely Mr. Lacy is more than “a little hypercritical” when he asks whether an image produced by the action of light is photography. I take it that the meaning of the word photography is “delineation (roughly speaking, drawing, painting, picture taking) by means of the chemical action of light upon certain substances” (Latham’s English Dictionary). Surely the very roots of the word should tell Mr. Lacy what photography is, viz.,  $\phi\omega\varsigma$ , gen;  $\phi\omega\tau\acute{\iota}\varsigma$ , light; and  $\gamma\rho\acute{\alpha}\phi\omega$ , I write. The first use of the word is ascribed to Joseph Nicéphore Niepce, according to Schiendl’s “Geschichte der Photographie,” p. 29, for he says that Nicéphore, in a letter to his brother Claude on May 9, 1816, states that he had used the lens of a microscope, and that he had made the discovery “es sei nicht unbedingt nöthig, dass die Sonne hell scheine, um Gegenstände im Freien aufnehmen zu können, man könnte daher den Namen *Heliographie in Photographie umändern*.” Probably I am “very much at sea as to the meaning of philosophical terms” if the meaning is that as evinced in the letters of Mr. Lacy; but may I ask him whether he is aware that a controversy has raged ever since the first formal use of the terms “noumenon” and “phenomenon” by Anaxagoras, as to whether we cannot perceive more than phenomena? I may be equally as well acquainted with Hegel as Mr. Lacy, as, some years ago he, with others of his school, formed a favourite subject of study with me.

I do not see that there is any benefit to be obtained by continuing this discussion, as I hold, and shall still hold, that photography is the action of light upon certain substances utilised in the production of pictures and reproduction of objects, and further that it is possible by the aid of photography to produce the phenomena of colours, as has been done by M. Lippmann; and as Mr. Lacy will admit neither *fact*, I do not see any advantage in discussing the question further.

I fail to see, further, why a dogmatic statement of a celebrated *physiologist* should be weighty evidence. An eminent *physicist* might prove that a certain effect was impossible, and on being shown this said effect would either have to acknowledge himself wrong, or else say, “It may be a fact, but all the same it is theoretically impossible.” Such authorities as Jannssen, Vogel, Becquerel, and even Captain Abney have had to admit that Lippmann has produced the colours of the spectrum; why then should the bald statement of Professor du Bois-Reymond be “weighty evidence”? <sup>p</sup>

I quite agree with Lient.-Col. Verney that it is impossible to state positively that photographs will never be taken in natural colours. Every year we are making greater and greater advances in photography, as in every other science, and the man will be more than bold who will say, “Thus far canst thou go and no further,” either in photography, electricity, or chemistry.—Yours truly,

FARBENLEHRE.

### THE EXPLOSION OF A GAS REGULATOR.

#### APPOINTMENT OF A COMMITTEE PROPOSED.

SIR,—The letter from your correspondent, Mr. Brandreth, containing an account of the above accident, will, no doubt, cause a certain amount of uneasiness to those who, like myself, are in the habit of using compressed gas. About two years ago I purchased a regulator of a pattern similar to that shown in your illustration for the use of the West London Photographic Society, which has been in constant use both by Mr. Horton, our lanternist, and myself ever since, and in both his hands and mine it has always worked well. I certainly think the subject is one which should receive careful investigation at the hands of experienced men, and I would suggest that, if possible, a committee of such should be appointed. Although I am willing to admit the great convenience of the compressed gas system, yet I confess to feeling much more at ease when using gases.

In regard to the cause of the explosion, I do not think, if you will permit me to say so, the theory suggested in your leader that it was due to the powerful compression of atmospheric air containing carbonaceous matter, etc., can be the correct one, because, owing to the construction of this form of regulator, the quantity of air contained in it before the admission of gas from the cylinder would be practically *nil*. My own opinion is (I admit it is very much a matter of conjecture) that by some mischance the valve

or passages of the regulator became blocked with foreign matter of some kind (possibly a fragment of metal), and that when the gas was turned on the obstructive substance was propelled with great force through the valve of the regulator, the friction so caused generating a sufficient amount of heat to effect the ignition of the inflammable portion of the bellows, the combustion, of course, being powerfully supported by the flow of oxygen from the bottle.

I certainly think, Sir, when we bear in mind the nature of the apparatus used in the production of the limelight by the compressed gas system, and the terrible results which may accrue from the unskilful or careless use of the same, that every possible means should be taken to ensure, as far as possible, the safety of those who use it, and those who profit by its use, and such an investigation as that which I have suggested will, I think, tend to that end.—Yours truly,

JOHN A. HODGES.

87, Chancery Lane, W.C., April 11th, 1891.

SIR,—The account given by Mr. Brandreth in your last issue about the explosion of the governor of his oxygen bottle is most incomprehensible. I have used compressed gases now for some few years past in lantern work, and I cannot but think that, confused by the accident, he has made some mistake as to what he had done before. First, oxygen of itself is altogether incapable of explosion (as is hydrogen also), and, therefore, it is quite certain that it was not pure oxygen that exploded. Then I do not believe that turning the valve of the bottle on and off a hundred times would have ignited gas, mixed or pure. There must have been a light somewhere. He had probably turned on the valve at the hydrogen bottle first, as he ought to have done, before turning on the valve at the oxygen bottle.

But if he had not seen that the jet valves were closed, as they ought to have been, the hydrogen could easily have found its way into the oxygen regulator, especially as he says there was some leakage there to begin with.

Then, when he tried to light the hydrogen gas in the lantern (or else he had it alight before), the mixed gas that was in the tube and the governor exploded with the result related. Of this we may be perfectly certain: (a) that no explosion could have taken place without the presence of mixed gases; and (b) that no explosion of even mixed gases could have occurred without a light. Hence there must have been mixed gas in the governor, and a light must have been applied or alight in the lantern.

The jet valves or cocks should always be turned off before the bottle valves are turned slowly on; then the hydrogen should be lighted in both (or three) lanterns, and after that the oxygen jet valves should be adjusted, one after the other.

When a lantern, too, is turned out for the night, or for a pause, the gases should be turned off at the bottles, and the gases should be allowed to burn themselves out, then you get no pressure left in the tubes, and the gases will not be mixed in them. But if either of the jet valves is turned on when the bottle valves are turned on, you are very likely to get mixed gases in the opposite tube, and this renders you liable to have the tube blown off and perhaps the governor exploded.

Personally I feel convinced that Mr. Brandreth was so astonished and confused at the accident, that he does not properly remember what he did to produce it.—Yours truly,

April 10th, 1891.

WERNER H. E. SOAMES.

SIR,—Being a frequent user of regulators for controlling gas at high pressures, I am naturally much interested in matters relating to their safety, and reading, in the current number of the AMATEUR PHOTOGRAPHER an account of the explosion of Mr. Brandreth’s regulator, gladly availed myself of your permission to examine the remains.

The triangular rubber bellows regulator, in my practice, has always worked very smoothly, leaving nothing better to be desired, but it has the drawback of being readily accessible to accidental damage, and my first opinion as to the cause of explosion was that what Mr. Brandreth thought a leakage at the coupling was really a leak in the rubber bellows, and that a glowing splint of wood, applied for the purpose of testing soundness, caused the accident; an examination of the regulator quickly dispelled the idea, and I apologise to Mr. Brandreth for suggesting it.

From all appearances, the ignition took place directly under the valve of regulator, above the cylinder valve, and your theory, Sir, that the compression of gas between the two valves caused

sufficient heat to ignite an oxidisable substance present, is probably correct. It hardly explains, however, the *explosion* in the bag, unless we suppose that the heated rubber gave off a vapour which formed an explosive mixture with oxygen, but there hardly appears to have been time for this, and we are faced with the difficulty that the explosion is reported to have occurred first.

Mr. Brandreth does not tell us whether the regulator had been previously used for hydrogen; if it had, the explanation would perhaps be simple. I do not think, Sir, your suggestion that the pressure accumulated between the valves from repeated turning on and off would have taken effect in this case, the leaky coupling preventing it.

The ignition of a few particles of *metal*, although sufficient to explode mixed gases, would hardly of itself be able to start rapid combustion in a large mass of brass, and so one cannot help thinking that some hydro-carbon such as grease must also have been present.

It is to be hoped that the matter will be thoroughly dealt with, and means taken to prevent such accidents, seldom though they fortunately are.

Anyone after seeing the wrecked regulator must admire the presence of mind of Mr. Brandreth; it must have taken considerable nerve to have so promptly turned off the pressure.—Yours etc.,

RICHARD HORTON (Hon. Lanternist, W. L. P. S.)

\*\*\*

#### GELATINE SLIDES FOR THE MAGIC-LANTERN.

SIR,—Permit me to draw your attention to a substitute for glass in lantern slides, and one which is capable of adaptation to the various processes for photo-mechanical printing.

The gelatine slides, a specimen of which I enclose, are clear; show well with lime-light or oil lantern; will stand the heat, having been fully tested by a number of lanternists here; are unbreakable, and light for transit by parcel post.

They may be printed upon from type in an ordinary press—hymns, etc.—or from engraved blocks, or the lithographic stone.

They are noticed in *Help* (Review of Reviews office, 1d.) for March.

They are particularly suited to the various processes of photo-mechanical printing, and thus are likely to revolutionise the slide trade, as they can be turned out by the dozen at a cheap rate. The clear gelatine sheets, slide size, are sold by Messrs. W. Strain and Sons, Great Victoria Street, Belfast, at one shilling per dozen, and they also supply a neat cardboard mount, which serves as a carrier, at eightpence per dozen.

For sketches, diagrams, statistics, and other illustrations needed in a hurry, they will prove invaluable.

I have no intention of securing a patent, but desire to see a more general use of the lantern for recreative, educational, and mission purposes, which is sadly retarded at present by the costliness of slides.

I shall be glad to forward a sample, printed from type or block, to any of your lanternist readers who may be interested, and who care to send three stamps to cover cost.—Yours faithfully,

J. A. NOBLE.

Y.M.C.A., 13, South Parade, Leeds.

\*\*\*

#### A LOST WATER WAY.

SIR,—Under the title of "Where to Go," "A. R.," a week or two ago, describes a most interesting water trip through England, embracing the Severn and the Wye. One of the links in the chain of water communication which rendered this trip possible, viz., the Hereford and Gloucester Canal, is now demolished, a railway usurping its bed in many parts. It is about ten years ago that I, with a companion, travelling in canoes, traversed this route with a camera. Probably we were the last, on pleasure bent, to do so, for a month or two later its filling up was commenced. I think it well to issue this warning, as the canal will be marked on the maps for a long time yet.—Yours truly,

Hereford, April 13th.

ALFRED WATKINS.

\*\*\*

#### THE FRENCH DEVELOPER, CRISTALLOS.

SIR,—I am surprised to find none of your readers seem acquainted with the French developer, Cristallos. It is as rapid as pyro, and first-class for instantaneous and film development. It also works well with bromide paper. I have developed time exposures with it very successfully, and by restraining with bromide and a proper amount of water there is not much fear of

fogging the plate. I sometimes use it as an accelerator for hydro-quinone with an under-exposed plate. Develop as far as you can go with hydro; wash it off, and pour on a not too strong solution of Cristallos, and the detail will come up in a marvellous manner. It is the cleanest possible developer, never staining fingers, cups, or dishes. I buy it ready made up and diluted, but it can be bought in boxes containing the ingredients and mixed at home.—Yours truly,

ETHELRED DILLON.

\*\*\*\*

#### CELLULOID TO FOCUS ON.

SIR,—It was with much pleasure I read in the AMATEUR PHOTOGRAPHER of the 10th inst. that Col. Verney is trying a celluloid film in place of the ground-glass, as I have used it in both half and quarter plate size for about two years, and I shall be pleased to hear Col. Verney's report on his experiment. I have shown mine to three or four camera makers, and they all thought it good, but it is almost impossible to get manufacturers out of the old groove.—Yours truly,

EDWARD BARNES

(Late Capt., 27th Inniskillings).

SIR,—I read in your issue of to-day a note on "Celluloid Sheets to Focus On." As it may be supposed to be a novelty, I may say that I have manufactured several cameras with celluloid focussing screens, with the result so far of securing a success. I have at present a whole-plate camera in stock with such a screen.—Yours truly,

J. R. GORTZ.

19, Buckingham Street, Strand, April 10th, 1891.

#### RULES FOR THE CONVERSION OF ENGLISH WEIGHTS AND MEASURES INTO THE METRIC SYSTEM.

To CONVERT either

Grains per 20 fluid ounces to grammes per 500 c.c.,

or " 10 " " " " 250 "

or " 1 " " " " 25 "

multiply the grains by 0.057 in each case.

To convert

Grains per fluid ounce to grammes per 1,000 c.c., multiply by 2.29

" " " " " 500 c.c., " by 1.14

" " " " " 100 c.c., " by 0.229.

Examples:—

Quinol... 40 grains  $\times 0.057 = 2.28 = 2.3$  grammes

Potassium bromide... 20 "  $\times 0.057 = 1.14 = 1.15$  "

Ammonium carbonate 480 "  $\times 0.057 = 6.84 = 6.9$  "

Water... 20 oz. 500 c.c.

Or,

Pyrogallol... 2 grains  $\times 2.29 = 4.58 = 4.6$  grammes.

Sodium sulphite... 8 "  $\times 2.29 = 18.32 = 18.3$  "

Bromide... 1 "  $\times 2.29 = 2.29 = 2.3$  "

Water... 1 oz. 1,000 c.c.

**Walking Stick and Tripod.**—Mr. J. M. Turnbull, of Rose Street, Edinburgh, has sent us for inspection a very well made and handy walking-stick tripod, which is as rigid as could possibly be expected, having regard to its extreme lightness and portability. The illustration

shows the form of tripod, and the following is Mr. Turnbull's description:—"The tripod itself is made of a specially drawn thin and hard telescope tube, of a section of one-third of circle, so that when the three tubes forming the tripod are placed together they form a circle. Inside each of these three tubes are two tubes of a section of one-sixth of a circle. These draw out of the outer tubes to double their length, and form a complete sliding tripod of the usual height. When not in use, the three legs of the tripod are placed together, and form a circle about three-quarters of an inch in diameter; these in turn are placed inside the walking-stick case, which is made in a special and entirely novel manner, of special thin steel and wood. When the tripod is inside, the cane can be carried and used as an ordinary walking stick, and is little heavier." The price is 22s. The tripod is, of course, most suitable for small cameras.

## Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

### CHAPTER VI.

#### CONTINUITY AND CURVATURE.

By the law or principle of *continuity* is meant the very opposite to anything bordering on disconnection. It also includes the idea of general order or plan, and so conduces

to unity. Everyone is conscious of an indescribable pleasure experienced in such bodily motion as in that of skating, swimming, and the like; while dancing has been called the poetry of motion. Without stopping at this point to discuss the probable basis for this pleasant sensation, it is enough for present purposes to say that it is just as pleasant and satisfactory as the jolting motion of a "bone shaker," or broken-sprung "four-wheeler" is unpleasant.

Let it be clearly understood that by continuity we do not mean simply monotonous repetition; but, on the contrary, a gradual transition, or, as it might be expressed, *continuity with variety*, not

so sudden as to produce *shock* but sufficiently varied to keep up interest, or even at times bordering on pleasant surprise.

In this as in all other matters, our foundation must be laid in the record of natural fact. Turn for a moment to the sea, and plan out in your mind the chief lines of the

wave crests—you cannot fail to observe a continuity of parts, sometimes tending towards symmetry, sometimes towards a radiate distribution of lines, sometimes as one great and leading line with all surrounding others in marked subordination; or it even may at times appear

to all but the closely obser-

vant as distinctly monotonous repetition. We may transfer our attention to the distribution of sand dunes or waves, or to cloud waves, or to the open panorama of hill and dale. We may follow out this principle in the receding pillars and arches of the cathedral, as they

gather themselves closer and closer together in the perspective distance.

We may subdivide the thought, and apply it to *lines*—noting the contours of very nearly all natural objects. True that the world of crystals is a world of straight lines and plane surfaces, but for the rest of the natural world before our eyes, nature works in curved lines of gentle continuity, in the leaves, flowers, stems, etc., of the vegetable world, and also in the forms of very nearly all animals.

We may apply the thought to *light and shade*, noting how one melts into the other through a thousand subtle steps for those who have eyes to see. Look at the continuity of line, and also of light and shade in cloudland alone. We may apply it also to the *planes* as they melt one into the other in the growing distance, and in that way contributing to our notion of space.

We may apply it to the component parts of the *subject*, the arches upon which we are building the sentiment, the story, the *raison d'être* of the picture, so that each part shall be a necessary and duly disposed part; just as in a properly orchestrated composition, each instrument is a support to and in good tune and harmony with all the others, each and all contributing to the exposition of the theme.

From the idea of continuity we may very naturally pass to that of *curvature*. It is a matter of common observation that any curve—even the circumference of a circle—is more pleasing to the eye than a straight line, and hence where we have parts of two or more circles in continuity, the total effect is more pleasant than two or more straight lines meeting each other.

A momentary glance at fig. 10 will make this point clear.

In the curve *a* we have parts of three different-sized circles in continuity, and going in the same direction (*i.e.*, the line joining the centres of two contiguous arcs, does not meet at the juncture until produced). The eye follows with placid interest the curve from *a* to *b*, when a variety is introduced (by a difference of radius) at the point *b*; this is continued up to *c*, where another change takes place. Compare this with the three straight lines *mn*, *np*, *pq*. At the point *n*, the monotony of the straight line *mn* is suddenly replaced by an unexpected change of direction along *np*, and similarly along *pq*, so that *n* and *p* are points of surprise rather than agreeable interest.

Consider fig. 11. Here we have a curve made up of two arcs of circles in opposite directions (*i.e.*, the line joining their centres passes through the point of contiguity). We see at a glance that the eye receives a pleasanter impression

when following the curve *a b d* than when following the broken lines *mn*, *np*, *pq*, *qr*, although the general path in

FIG. 10.

FIG. 11.

FIG. 12.

FIG. 13.

both cases is approximately the same. It may be as well here to notice a physiological matter. The eye in following the circular arc from *a* to *b* has had time to acquire a certain degree of muscular co-ordination, and the tendency is to continue in the same monotonous curve along the dotted line *bc*, but at *b* the variety is introduced—the part along *bd* soon becomes monotonous. If now, at *d*, we imagined the part *ab* to be repeated and so on, although there would in this way be built up a continuous curve with points of variation, and therefore of interest at intervals, yet the eye would very quickly acquire the power of anticipating the recurrence of these points at regular intervals, and so very soon the evenly wavy curve would become (as we know it to be from experience) distinctly monotonous.

Thus while nature shows us continuity and curvature as great laws of growth and form, it is to be observed that the curvature is *very* seldom monotonous. The outline of any leaf or feather will show this at once, and also illustrate the great charm of this modulation of curvature, all the more when it is applied to what we might unobservantly think was rigid symmetry; note this especially in the contour of feathers. The most uncultured eye will see at once that the curve *b* (fig. 12) is much more interesting than *a*, which is the monotonous arc of a circle. The careless observer may be disposed to say that the upper part of *b* is straight, and it is only towards the hook end that there is a curvature. Let him hold the paper up to the eye and look along it, and so dispel that idea at once.

Finally, the hasty reader may be disposed to jump to the conclusion that the above is simply a plea for having everything in a picture bounded by curved lines. This inference is entirely unwarranted. For, on the contrary, I hasten to say that a picture all curves more often than not conveys the feeling of weakness, instability, and even monotonous, whereas a few straight lines judiciously introduced gives firmness, solidity, and even adds a refinement to the more subtle parts of the neighbouring curves. This latter point may be seen in fig. 13, where we have *a*, a straight line, and *b* a gently modulating curve. The straight line is an undoubted assistance in appreciating the curvature of *b*. This is even more evident in the case of *c*, a curve made up of numerous minor curves. This we see in nature, where we unconsciously avail ourselves of the horizon line wherever visible when endeavouring to analyse the more subtle curvature of the waves. In landscape, too, here and there a freshly exposed cleavage plane of rock is of great assistance in feeling the finer curves of more denuded parts. The mast is of the utmost importance in perceiving the finer subtleties of the belly of the sail, or the catenary of suspended ropes, chains, nets, etc. But here, as in all other matters of fine art, it is not so much the existence of this, or presence of that, which makes it a work of fine art, but just that one perfect and correct admixture of this and that in due proportion, that enables it to yield the maximum of refined pleasure with the minimum of fatigue.

(To be continued.)

The Astronomical Congress met on the 31st ult. at the Paris Observatory, which was ornamented for the occasion with French and foreign flags. The chief object of the Congress is to enable the various members representing distant observatories to exchange their views with regard to work that has been done in preparing a photographic map of the heavens. The celestial space has been broken up into a great number of parts, which are distributed among the various countries. From 4,000 to 5,000 plates have already been obtained, and will be carefully examined during the sittings, which will last to the end of the week. Admiral Mouchez took the chair. There were twenty-six members present, representing France, Italy, England, Russia, Holland, Chili, Germany, the Cape of Good Hope, and the Vatican. The English delegates were Messrs. Abney, Knoben, and Plummers.

## Instantaneous Photography.

BY W. JEROME HARRISON, F.G.S.

### CHAPTER XIV.

#### LENSES AND LIGHT.

ALTHOUGH it is quite possible to photograph a perfectly black kettle in a perfectly dark room, yet it need scarcely be said that plenty of light, and of the right quality, is practically essential for success in *instantaneous* photography.

*White Light not Pure.*—We have used the expression “light of the right quality.” Probably every reader of this article will be acquainted with the composite nature of white light. A beam of sunlight is composed of an infinite number of colours—which are displayed in the rainbow, or when a sunbeam is caused to pass through a prism—but of these we usually recognise seven only, viz., red, orange, yellow, green, blue, indigo, and violet. There are also invisible (heat) rays which lie beyond the red, and other invisible (actinic, or chemically acting) rays which extend beyond the violet.

The important fact to the photographer about these differently coloured rays is that only the blue, the violet, and the ultra-violet have any practical effect upon ordinary gelatine-bromide plates, during the rapid exposures necessary in instantaneous photography. With isochromatic plates, the green and the yellow rays also produce some effect; though even in their case the blue and the violet rays act more powerfully.

*Optical and Chemical Effects of Light.*—Now, the effect of the variously coloured rays upon our eyes is very different to their effect upon our plates. Yellow is the most luminous, or makes objects which reflect it seem the brightest. The comparative effect upon the eye and upon an ordinary dry-plate is shown in the following table, where the maximum effect is represented by the number 1,000:—

Colours.	Luminous Intensities.	Chemical Intensities (upon ordinary Silver Bromide).
Dark red ..	Just perceptible ..	0
Red ..	32 ..	5
Bright red ..	94 ..	10
Orange ..	640 ..	50
Yellow ..	1,000 ..	100
Green ..	480 ..	200
Blue ..	170 ..	500
Indigo ..	31 ..	1,000
Violet ..	6 ..	650
Ultra-Violet ..	0 ..	450

Thus the effect of yellow light upon the eye is ten times greater than it is upon the dry-plate; while the effect of indigo light upon the plate is thirty-two times greater than it is upon the eye.

*Use of Exposure Tables and Meters.*—The table just given causes one to doubt the recommendation so often heard from the “old hands,”—“Cast exposure-rules away; and rely upon the appearance of the image as seen upon the ground-glass.” Now, as the rays which (mainly) cause the visibility and brightness of the ground-glass image are *not* those which are principally instrumental in producing the invisible or “latent” image upon the dry-plate, and as it is impossible (by sight only) to judge the correct relationship between them, it would appear that exposure meters or tables based upon correct and scientific principles may, and ought to be, of great service, especially to the beginner or to those who, like many amateurs, practice photography only at irregular intervals and for brief periods of time.

But the "old hand" may proudly reply, "Yet I carry no 'tables,' no 'meters,' and my exposures are generally correct!" Well, this reminds one of a great (and candid) oculist who, when congratulated upon the success of a difficult operation, replied, "Ah; but I spoiled a hatful of eyes learning how to do it!" And in gaining the experience which enables him *now* to expose correctly, the "old hand" has probably paid no small tribute to the plate-makers. But even in such cases it is probable that it is the general impression produced by the scene upon the practised eye, together with memories of time of day, time of year, etc., as compared with successful exposures on former occasions, which influence those who dispense with "tables," more than the seeming brightness of the image upon the ground-glass. There are, indeed, certain states of the air when the atmosphere appears quite luminous with yellow light, and when the focussing-screen image shows no diminution in brightness, yet when exposures have had to be lengthened ten or twenty times. There are now at least two excellent exposure meters upon the market—Watkins' and Hurter and Driffield's. We have used both of these for the same purpose, and in the same way, as a calculator uses a slide-rule, viz., to render more certain, more easy, and more correct one's results. If we were in the habit of doing landscape or general out-of-door work *all day and every day*, we might possibly dispense with such aids; but as it is, we feel grateful to those who have placed such convenient instruments at our service. There are, besides, many books of "exposure tables" which will render good service. No doubt the man of long experience and constant practice finds his memory to act as the best "exposure meter" of all; but to the great body of "lovers of photography" we are convinced that such aids are useful.

In connection with instantaneous photography many a plate will be saved, and much time and trouble also, if the following rule is borne in mind: *When meter, or table, or experience shows that an exposure of more than one-tenth of a second is necessary with stop f/8, LET THE SUBJECT ALONE—DON'T ATTEMPT IT.* Of course, this rule wants applying with discretion, and under circumstances which we shall explain when treating of exposures; but in the meantime it may be taken as a pretty fair stand-by.

**USE OF LENSES.**—A lens is a contrivance for concentrating the rays of light. The pupil of the eye is only one fifth of an inch in diameter; but when the astronomer at Mount Hamilton places this narrow optic opening at the focus of the great Lick telescope, his pupil is expanded, virtually, to a diameter of three feet, that being the breadth of the magnificent object glass which peers heavenward at the other end of the sixty-foot tube.

It is, as we well know, quite possible to dispense altogether with a lens in photography, and to use simply a pin-hole, through which the rays of light enter to form an image upon the plate. But our exposures must then be very prolonged, from ten minutes to an hour; and to employ pinholes in place of lenses for instantaneous photography would require plates six thousand times more sensitive than those which are now at our service.

**Matt-Surface Obernetter Paper.**—We have recently had the pleasure of trying some of this paper as supplied by Mr. Gotz, of 19, Buckingham Street, Strand, and were very pleased with the results we secured. The paper prints very quickly, and is so sensitive, in fact, that it is unsafe to open it except in the dark-room. It can be toned by any of the ordinary processes, but the best results are certainly obtained by using the solution supplied by Mr. Gotz for the purpose. It is sold in concentrated form, in bottles sufficient to make 36 ozs. of toning solution. The range of tone procurable is great, ranging from soft warm greys to purple black, and we should imagine that the new paper will be largely used in the coming season on account of its many advantages.

## Our Contemporaries.

*Wilson's Photographic Magazine* gives the following "Process to Restore the Primitive Tone to a Deteriorated Print:—A silver print, rendered yellow by time, may very easily be brought back to its primitive tone by plunging it in a bath composed of—

Distilled water .. .. .	500 gram.
Saturated solution of bichloride of mercury in	
Chlorhydric acid .. .. .	8 to 10 drops.

The print should be removed as soon as it acquires a strong purple tone, and washed with the greatest care in several waters. Dry and mount. If a warmer tone is desired, tone afterward in a bath composed of—

Distilled water .. .. .	125 gram.
Chloride of gold and potassium .. .. .	1 "

This bath may be used until exhausted. For getting prints on silk make the following solution:—

Gum benzoin .. .. .	0.80 gram.
Gum mastic in tears .. .. .	0.50 "
Chloride of cadmium .. .. .	3 "
Alcohol .. .. .	100 c. c.

Filter, then immerse the silk, and afterward hang up to dry. Sensitize in a silver bath at twelve per cent., slightly acid. Again dry, and iron the silk before placing it against the negative. Toning and fixing are the same as for albumenised paper. Again iron after careful washing.

The *International Journal of Microscopy* says—"Mr. Nelson puts the limit of magnification for photo-micrography at 1,000. He has reached 1,500, and in special instances even 1,650, but he regards 1,000 as a useful limit. This can be obtained by an inch objective, with an eye-piece giving twenty times the initial power of the lens."

*Anthony's Photographic Bulletin*, speaking of "The Amateur as a Specialist," says:—"As a teacher in an English literature class said when asked to plan out a course of reading, 'If you are interested in anything, read about it, and one book will lead you to another.' So if one is interested in any particular subject, or has had some small modicum of success, let him follow it up on the same line. Time and money will both be saved if one concentrates, for a while at least, on a special branch, be it portraits, interiors, landscapes or animals. One kind of shutter, one make of lens, one brand of plate, one style of camera will usually suffice; and if by skill or luck one happens to make a great hit while working on one class of subjects, the temptation to return to indiscriminate view-taking will be lessened, while the desire to reach technical perfection will be stimulated by each successive effort in a single direction."

The *St. Louis and Canadian Photographer* gives the following printing process in India ink:—"Float the paper on

Water .. .. .	600 parts
Chloride of iron .. .. .	15 "
Citric acid .. .. .	15 "

Dry in a dark place, and print under a negative until a picture becomes visible. The print is now developed in a solution of gelatine containing India ink (or any other colouring matter). The coloured gelatine adheres in those places where the light has acted, more or less, and when fully developed, it is simply washed in cold water."

The *Lithographic Art Journal* gives the following method of transferring a photograph from chromate paper to zinc:—"Place the chromate paper containing the photo for ten minutes between two sheets of paper which have been saturated in a 1-5 solution of nitric acid in water. Upon the zinc plate place a piece of paper which had been previously soaked in nitric acid, and pull through the hand-press, which will cause a slight etching of the surface of the zinc-plate; the sheet of paper is taken off and all traces of nitrate of zinc are carefully removed from the zinc-plate by means of a blotter. The photo is then transferred upon the plate, gummed over, etc.; it is then rubbed in with ink, which has to be thinned with olive oil, and when all details appear sufficiently strong the plate is etched with a preparation made by adding a small quantity of phosphoric acid to a gum solution. When a drop of such a preparation placed upon a polished zinc plate discolours the same and affects its purity, then it is of sufficient strength."

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

THERE is in Edinburgh a body which calls itself "The View-finders' Club." It is small, being limited to twenty-one members, and is not confined to photographers, though probably these are more numerous than any other class of members. The club gets its name from the fact that a subject is chosen, and every member who attends the succeeding monthly meeting is required to find a view illustrative of it. If they cannot find a view, they, of course, stay away, and this has the effect of limiting attendances. That the club has not been very successful is shown by the fact that the roll of members is not complete, and an effort is being made to fill it up. The idea is a fairly good one, were it not for the drawback that it does not work well in practice. The intention is to educate the members in art principles by criticism of their work. Now, that is a rather difficult thing to do. One is tempted to ask why so much energy is wasted in Edinburgh over small affairs like this, when the same amount, if concentrated, might be able to produce an institution of some merit, such as the projected Scottish Camera Club. Talent for such an undertaking is not a-wanting. All that is wanted is direction, and it is to be hoped, in the interests of photography, that this may be forthcoming soon.

A slight fire occurred on the premises of Mr. Wm. Hume, the maker of the "Cantilever" enlarging and other photographic apparatus, in Lothian Street, Edinburgh, on Wednesday morning. The outbreak was trifling, but it had been found on the previous day that a gas pipe in the premises was cut, as if by a sharp instrument, in several places. The police are endeavouring to discover if there was a malicious intention in this incident.

The other day in Prince's Street an excited crowd might have been seen round a cart which was standing in front of a photographer's premises. The photographer was clearing out his stock of superfluous negatives, and as they were tumbled into the cart the crowd helped themselves, not a few getting some choice specimens. The operation was surely being carelessly carried out, as it is scarcely fair to sitters that their negatives should afterwards be picked up on the streets.

Newspapers are gullible articles. A few days ago an Edinburgh daily paper announced with the air of one who has discovered something which is really important, that a prominent photographer in this city was about to introduce the practice of taking photographs by the flash-light, a method of photographing which would enable photographs to be taken at night. The writer had apparently never seen the late photographic exhibition in Edinburgh, in which there were several excellent flash-light photographs by Mr. Slingsby, of Lincoln.

Mr. A. S. Watson, a late assistant to Mr. Marshall Wane, photographer, George Street, Edinburgh, has acquired the business which has for a number of years been carried on by Mr. G. Shaw, at View Park, Bruntsfield Links, Edinburgh. Mr. Watson is an accomplished photographer.

Among the many uses to which photography is put, one of the most common is the representation of "facts" in connection with cases in the Law Courts. Recently a photograph came under my observation which I cannot help thinking was intended more to assist the side which produced it than to show the object as it really was. The subject was an architectural one. It was averred on the one side, and denied on the other, that a building was off the perpendicular, and the photograph was handed in to show that it was off. The portion so represented was, however, shown at the very margin of the view, where distortion might very easily have crept in, or might as easily have been produced by tilting the camera. This was not observed, however, the legal, quite as much as the general, mind apparently being still under the impression that in a photograph it is not true to say that "things are not what they seem," and the photograph was allowed to pass. When it comes to be known what can be done in a photograph one can imagine how such productions will be looked at askance by the gentlemen of the Bar, and what severe cross-examinations there will be of the artists, as to what description of lens they employed, whether they tilted the camera, and if so, whether they made use of the swing-back, etc. The first photographer who gets "jumped upon" in that way will open his eyes with astonishment. It is apparent that a little knowledge of photography would be a useful adjunct to both the bench and bar.

## Exhibitions.

### LIVERPOOL INTERNATIONAL PHOTOGRAPHERIES.

No. VI.

(By our Special Correspondent.)

As no doubt would be expected, both by those who have and those who have not visited the Liverpool Exhibition, the scene at the closing last Saturday was interesting and significant. There was an enormously crowded house, and the liveliest concern was manifested in the proceedings during the concluding hours. Everybody seemed to be in an anxious state of mind to "see the show all over again." Many did so, others could not for the crowd. Had it been possible to extend the season, the extension would have proved profitable at least for several more weeks. One of the most conspicuous circumstances in connection with the show was that it steadily grew in public favour from the opening night. The excellence of the exhibition in all departments conduced to this end. As a whole—and a very large and comprehensive whole—the exhibits have afforded delight to photographers and the general public alike. The series of superb lime-light demonstrations have drawn thousands of visitors, and the musical adjuncts have been light and pleasant seasoning to the more substantial fare. It is not too much to say that the enterprise and vigour of the Executive would have commanded success under much less favourable conditions; as it is, these gentlemen have made what was comparatively a foregone success into a lasting triumph.

#### HINTS FROM A RETROSPECT.

Looking back on the exhibition, some valuable hints may be picked up. It was, indeed, by benefiting by their own experiences in 1883, and those of promoters of subsequent shows, that the executive of the Liverpool International 1891 Photographeries were enabled to do so much and so well. First, they entered upon the project unanimously and energetically; then they carefully and anxiously considered and determined upon the schedule of conditions, striking out several new and original lines in the matters of classes and prizes. These are well-known now in the world of photography, and need not be further dilated upon. A large number of medals, between thirty and forty, were offered to competitors in all departments of the photographic art, beginners not being forgotten. Having thus got the preliminaries arranged, schedules of conditions, application forms, and the other necessary documents were printed in three languages—English, French, and German—and despatched to societies scattered pretty nearly all over the world, advertisements at the same time appearing in all the prominent photographic journals. This was many months ago. The response was beyond all expectation; exhibits came from far and near. Encouraged by their success up to this stage the exhibition executive moved faster and further at home, one of their first steps being to secure two more rooms at the Walker Art Gallery for the reception and hanging of the pictures. They left no stone unturned to command support. Not a detail was forgotten, or, once thought of, hurried over. Everything was given a due amount of consideration and discussion. The hanging and arrangement of the exhibits was, consequently, begun under favourable conditions, and being conscientiously carried out, the opening arrived with the whole exhibition in readiness. The subsequent progress of the show has been detailed week by week in the AMATEUR PHOTOGRAPHER, so that little further need be said on this head. About the smallest attendance on any one day was a few figures under 1,000; the largest attendance reached was on Saturday last, when 2,530 people passed through the turnstiles, the shillings taken totting up to nearly £100. In all 53,000 or 54,000 persons have visited the exhibition during the run. Up to the time of writing the exact figures have not been made out, but a very substantial balance to the Liverpool Association, under the auspices of which society the show was promoted, is assured. This is the more praiseworthy when it is taken into consideration that the advertising and other expenses of the scheme have been on a lavish scale. In addition to handsomely repaying the promoters, the exhibition has been made entertaining—one of the very best features from the public point of view, perhaps. The "rounds" of the exhibits have been enlivened by admirable selections of music ably given by prominent instrumentalists and vocalists; if the expense of these has been heavy, the outlay has, nevertheless, been money

well spent. There was not a dreary five minutes at the Walker Gallery from one end of the show to the other. I point these things out simply as a guide for promoters of photographic exhibitions in the future. Seldom, if ever, has a more enjoyable and instructive resort than the Liverpool International 1891 Photographeries been offered in "the dark spot on the Mersey." This is as it should be. The transactions of the British Association of 1854 record that Professor Phillips, speaking of the labours of Lord Rosse and Dr. Robinson—both of whom possessed the most perfected telescopes then in existence—in photographing the room, said:—"That nothing that they had to show in the shape of photographs of the room was at all to be compared with the results obtained by the voluntary efforts of the photographers of Liverpool." For the past thirty or forty years Liverpool photographers have done a very great deal for photography in general and their fellow townsmen in particular; the laymen of Liverpool have at last done something in return by supporting the now defunct International Photographeries as no similar exhibition was ever supported before.

#### THE FINAL RUSH.

During the last week there were enormous crowds, as already stated, and in no section of the exhibition were these more noticeable than at the lime-light demonstrations. Foremost among the lecturers who were called upon twice a night to give their demonstrations were Mr. Paul Lange—"Iceland," "Norway," "Scotland;" Mr. Lamond Howie, "Ober-Ammergau;" Mr. G. E. Thompson, and others. Almost without exception, the demonstrations have proved phenomenally successful, the lecture rooms in some instances, notably for "Iceland," "Norway," "Ober-Ammergau," "Northumbria," "Italy," "Florence," etc., being filled long before the time of commencing. In one or two cases people took their seats soon after six o'clock for lectures which commenced at eight. Towards the close four packed lecture rooms a night were the rule. Among the demonstrators, in addition to those named above, Mr. J. Pattison Gibson, Mr. Fred Clibborn, Mr. John Hargraves, Mr. S. G. Harrison-Dearle, Mr. Wm. Tomkinson, Mr. A. F. Stanistreet, Mr. T. S. Mayne, Mr. A. R. Dresser, Mr. Brownrigg, Mr. E. M. Tunstall, Mr. A. J. Cleaver, and Mr. Timmins should be mentioned. There are several others which I forget at the moment.

#### TWO MORE PRIZE WINNERS.

One of the classes of the exhibition, the "General Collection," in which two silver medals were given, has probably been somewhat overlooked by the great bulk of visitors. The pictures in this class were distributed over different parts of the show, and consequently were somewhat isolated. However, had they been kept together they would have made an unusually fine display—particularly several superb architectural interiors and exteriors, large size, sent from abroad. The two prize winners in the "Generals" are Mr. Charles Scolik, of Vienna, and Mr. H. S. Redfield. Both gentlemen show very fine work. Mr. Scolik, the editor of the leading amateur photographic journal in Germany, is a distinguished worker who has turned out many really excellent studies. One of his pictures entitled "The Happy Compromise," shown in the exhibition, is also reproduced (No. 12) in the official catalogue, and is a pronounced work of art. By the way, the later catalogues of the show are, I see, being bound in morocco, and are a souvenir of the big show which in future will be of some value.

#### FINALE.

The Ladies' Social, conversazione, dance, and distribution of prizes, arranged as the finale to the show, came off on Tuesday night in the City Hall, and were very successful. Many tickets were sold for the function; and the curtain could not have been rung down on the exhibition more happily. It now only remains to heartily congratulate the executive and the members of the Liverpool Amateur Photographic Association on their splendid success. The names of the executive are:—Chairman, Mr. Paul Lange; Hon. Secretary, Mr. T. S. Mayne; Hon. Treasurer, Mr. A. F. Stanistreet; Committee, Messrs. A. J. Cleaver, C. O. Ellison, P. H. Phillips, and W. Tomkinson. All these gentlemen have worked together with marked unanimity and enthusiasm.

#### NEW ENGLISH ART CLUB.

By LOITERER.

THE candid critic, departing from the Sixth Annual Exhibition of Modern Pictures, held by the New English Art Club, at the Dudley Gallery, can do no more than sigh. Genius disguised under veils of obtrusive crudity is to be seen on every wall of this exhibition, but genius nevertheless. Can anyone really admire Mr. E. A. Walton's expensive "Sisters" (3)? If so, we will lead such a person gently up to survey Nos. 9, 11, and 12. Mr. George Thomson's clever sketch of "Olympia as a Skating Rink" (4) deserves some praise, although its neighbour, "The Road to the New Forest," is a pleasanter theme. Mr. Theodore Roussel's "Brighton" (20) has been already reproduced in the pages of the *Pall Mall Budget*. "Counting the Flock" (23) is terribly vivid, but then there is hardly a landscape in the exhibition which is not. "Old and New Battersea Bridge" (30), by Mr. Sydney Starr, is clever; but the same cannot be said for "Pastoral" (34), where one could imagine that a non-sympathetic person had sat on the newly finished picture, before the colours were dry. We are painfully reminded of Reckitt's blue on looking at "An Old French Peasant" (38). Mr. George Davison might find a suggestion in Mr. Fred Brown's "Sunset at Sea" (41). "A View of Diaple" (42) shows Mr. Walter Sickert almost at his best. "Nature Morte" (44) is good. We suspect a London fog in Mr. Arthur Thomson's clever "Regent's Canal" (46). A boy reading by the light of a stove is well depicted (51) by Mr. E. Sichel. "Mother and Child" (39) is not pleasing. "The First Bawbee" (70) is capital, and some fruit (72) is quite a relief, especially as the picture is excellently painted. Mr. J. J. Shannon's portrait of the "Duchess of Portland" (79) is admirable. The little picture by Mr. Otto Scholderer, entitled "Oysters" (80), is very true to nature. Its neighbour, "The Common," by Mr. F. Bate, is not at all pleasing. Mr. J. E. Christie's "The Pixies' Ring" (83) is decidedly clever. Mr. W. Estall's "The Autumn Sun" (92) is impressionistic and good. "In an Orchard at Finistère" (93) is another example of vivid greens and yellows. Neither of the pictures sent by Mr. Maurice Greiffenhagen (96, 97) appears to us to be worthy of the artist.

#### Thursday Evenings at the Camera Club.

(By ONE OF OUR STAFF.)

ON Thursday, April 9th, the day following the ending of the annual Conference, there was a large gathering at the Camera Club to attend the "Flash-light Demonstration" given by Mr. Cade (of Messrs. Marion and Co.) The Slingsby apparatus was used, and some very successful negatives were taken of the room and the company. Mr. Stromeyer showed some prints from negatives taken with magnesium ribbon placed in the ordinary pendant lamp of a room, the lamp being in the picture. One of these showed very picturesque lighting. Dr. Crocker handed round some photographs of medical cases, showing the service rendered by flash-light on such subjects.

On Thursday, April 23rd, Mr. Frank Howard will read a paper on "Photography in Bye-lanes and Field-lanes." The paper will be illustrated by the lantern.

Mr. Fred. J. Prouting, of Tilehurst, writes:—"The AMATEUR PHOTOGRAPHER appears to be a good medium, even thus early in the season, and I have been astonished at its ubiquity. The enquiries for my lawn tent and studio come from the remotest districts, are businesslike and to the point, and generally lead to satisfactory results. I shall certainly increase my demand upon your space if business and the season advance apace."

**Pearlines.**—Mr. Ernest W. Perry, of Shakespeare Road, Herne Hill, S.E., has sent us a photograph mounted in optical contact with a neat border which is an improvement on the commercial "opalines." He undertakes to mount any photographs as "Pearlines," and the cost is, we understand, eight shillings per dozen for half-plate size. Those who wish to have the views they have taken mounted in an effective manner on glass cannot do better than send to Mr. Perry. A photograph so mounted may be seen at our offices.

Mr. T. H. Taylor, L.D.S., writes:—"I never failed in an advertisement in your paper yet, and consider it the best medium out."

## Camera Club Conference.

THE Conference was resumed, under the presidency of Capt. Abney, at the Society of Arts, on Wednesday, the 8th inst.

The first paper was "Photography and Illustrated Journalism," by Major Nott, in the course of which he said: "It has to be admitted that the retaining, keeping up to date, and handing on the nation's history, not only in its grander phases, but in its humbler domestic life, are inherent obligations we owe to ourselves and to posterity. Now, the part photography can take in this work will undoubtedly soon be one of its most appreciated powers, and elevate it into a position in the art world, where it can be made to stand without a rival. Hitherto, the work that has been done in this connection has largely been in the hands of artists who have learnt to work with the pencil or the brush in some of the various schools of art. Hence, to a great extent, the work has had but little value when regarded from any other point of view than the artistic. Even the most æsthetic portion of the public, who have a keen appreciation of all artistic work, must, in common with that portion which possesses a less keen susceptibility to æsthetic pleasure, prefer, in work of the class to which we are now referring, accuracy of detail, and exactness to facts rather than "pictures" wherein essential features have been sacrificed in order to conform to certain rules which dominate art. The camera par excellence for this class of work is, of course, the one now known as the hand-camera, but many forms of hand-cameras are utterly unsuitable. The great desideratum is simplicity of construction. The camera for the purpose should be light in weight, and its working manipulation be confined to two simple operations: setting the shutter before exposure, and removal of the exposed plate or film afterwards. There should not exist any complicated mechanism liable to get out of order at times, or that cannot stand a certain amount of rough usage. To do the work we are now considering it is absolutely necessary for the faculties to be concentrated upon the scenes themselves, and this is hardly possible if the manipulation of the camera at crucial moments calls for any attention, such as would be required in one where a plate-holder had to be inserted, a shutter drawn, focus adjusted, or the camera had to be treated after the manner required, I am told, in dealing with a naughty girl, well shaken to make it behave, which in one camera I lately possessed was absolutely necessary. The shutter ought to work slowly, and under ordinary circumstances be so used, but possess the means of being readily given increased speed. The character of the lens is all important. It should be of as long a focus as its use in a hand-camera will permit when the considerations regarding definition, focal adjustments, and other questions of like nature have been given the attention their importance demands. The lens should be one that will work at the very largest aperture optically possible. This feature I have come to regard as essential, for it enables photographs to be taken possessing sufficient detail for the purpose we are considering on dark or even foggy days. By using a lens of this character I have procured fairly good views of scenes enacted in a November fog, not, of course, a London particular, but one of the class usually selected by our Lord Mayors for their peripatetic shows. It will also enable the camera to be used in well-lighted interiors, and under many other circumstances utterly impossible if  $f/11$  or even  $f/8$  is the largest aperture permissible." Proceeding, the reader said that films were better than plates for that particular purpose. Above all things, it was necessary that the picture taken should tell its own tale, and for that end the photographer's whole attention and energies should be devoted to studying the scene and selecting the best point of view. In concluding, Major Nott handed round a partially engraved block to which a photograph had been transferred, and which was to appear in the *Daily Graphic*.

The President said it would be very interesting if Major Nott would tell them how the photograph was transferred to the block.

Mr. Debenham pointed out that one of the great drawbacks in the use of reproductions of photographs hitherto had been that they could not be printed on a rotary machine, but the more recent Marinoni machines were more perfect, and the blocks could be worked well on them.

Mr. Welford said he could not see how films were better for newspaper work than plates. On one occasion he took a view for a newspaper, and in an hour a bromide print of the subject was on its way to London.

Mr. Carmichael Thomas, of the *Graphic*, said the photo-

graphers must not abuse the artists too much, and take too much credit to themselves. The illustrated papers benefited greatly by photography, and they now found that there were many occasions on which they need not send artists to places of interest, as they knew there would be plenty of cameras there, the owners of which could send in photographs.

Mr. Hepworth said he had tried, but unsuccessfully, to discover the secret of the transfer of photographs to wood. The best attempt he had made was in the case of a chloride emulsion with very little gelatine, which he rubbed into the block with his finger. The engraver found one sample too hard, and another made the wood too soft.

Mr. Maskell asked for some information about the cheaper methods of reproducing pen and ink sketches in such a way as those often seen in *Pick Me Up*.

Mr. Warnerke said he had made experiments in the same direction, and he found that the best ground for engraving on was an ink transfer made by his simplified collotype process.

Mr. G. Davison said it was quite possible to put any sentiment they saw in a view into the photograph.

Major Nott, in reply, said that the process of transfer was a trade secret. The point in which films had the advantage over plates was that they could be developed at the place where they were exposed, rinsed under the tap, and put in the pocket. When the train was reached, they could be pinned to the sack to dry, and printed before town was reached. That could not be done with plates. There was an advantage in engraving the blocks, as anything not artistic and not necessary to the truth of the picture could be left out.

The President said that if the films could be developed on the spot, it was due to the action of the Camera Club and the AMATEUR PHOTOGRAPHER in awakening the interest of the local photographers and causing them to give such facilities to amateurs. He, however, looked upon that kind of work as a misuse of photography, though perhaps necessary for illustrated papers. It was getting too mechanical.

Mr. Sutton read a paper on "A New Method of Making Photo-Mechanical Printing Blocks." An ordinary gelatine plate was exposed under a negative and a line screen, and then developed with the ordinary pyro developer. The plate is then washed, care being taken that the image does not absorb too much water during this necessary operation. Next, the plate is heated on an iron horizontal surface very gradually by a Bunsen burner, and while this heating is proceeding, a curious change can be observed extending over the surface of the gelatine. The little dots formed by the line screen remain perfectly insoluble, but the gelatine which has been unexposed between those dots melts to a certain extent, and leaves the exposed dots standing up in high relief; in other words, the image engraves itself by means of heat. The plate is next dried, and, after being dusted over with graphite to give it a conducting surface, is at once placed in a copper solution in connection either with a battery or with a dynamo machine, as in the ordinary electrotyping process, and a metal block is the ultimate result.

Mr. Bolas said the paper was an interesting one, but it seemed to him that it was founded on suggestions made some years ago by Mr. Swan.

Mr. Sutton pointed out that the insoluble dots absorbed the soluble gelatine between them in varying proportions, and so the plate really graduated itself.

Mr. Debenham thought much might be expected of the process.

Mr. Warnerke thought the process was different to the one he described some time ago.

Mr. Sutton handed round some blocks and prints, which were excellent, considering the newness of the process.

The President congratulated the Conference and the Club on having had the subject first brought before them. The process seemed to him different to all the other photo-mechanical processes.

The other papers were interesting but extremely technical: "An Application of Photography," by Professor C. V. Boys, in which the experiment was shown of a series of photographs of a falling drop of water thrown in rapid succession on a screen, so that the drop appeared to gradually form at the end of the tube, break off, and fall; "A Review of Photo-Electricity," by Professor Minchin; and Mr. Elder, M.A., showed and explained some samples of Mr. Carey Lea's new allotropic forms of silver.

In the evening the annual dinner was held at the "Criterion," under the presidency of Capt. Abney.

## Quarterly Examinations in Photography.

**Question 1.**—What is meant by ripening an emulsion? Give the different methods.

**ANSWER.**—The ripening of an emulsion is the increasing in size the particles (or crystals) of bromide of silver held in suspension to a size more sensitive to the action of light. It is probably caused by the nitrate of potassium (formed by the chemical exchange) or some other solvent present and the gelatine dissolving and transferring some of the particles and thus building up the larger ones according to the law of crystals. Eder has measured the size of the particles when freshly formed and also when ripened, but in practice the change is noted by the colour of a gas flame when viewed through a thin film of the emulsion, being ruby when first formed and changing through yellow to a blue-gray, beyond which the silver becomes reduced and gives "general fog."

There are two methods in use—(a) cooking, (b) ammonia. (a) The original method of cooking was to keep the emulsion liquid at a comparatively low temperature for several days, but it is now found that boiling at a high temperature for a short time gives the same result. (b) Adding a small quantity of ammonia to the emulsion and ceasing just short of the fogging point. Each maker has his own formula, and uses some modification of either one or both of these processes.

**Question 2.**—A plate has been specially coated with a film of emulsion  $\frac{1}{4}$  in. thick, and is exposed on a brilliantly lit object for one-tenth of a second, yet on development an image is seen on the back of the film. To what action would you ascribe this—the light not having been able to penetrate through the film? And state any other instances where such action may occur.

**ANSWER.**—The phenomenon referred to is caused by the action of the nascent silver formed by the developer from the sub bromide of silver (or whatever the reduction product is) on the silver bromide which is in immediate contact with itself. First the developer reduces the silver sub-bromide to the metallic state, then the silver so formed acts on the bromide of silver behind it, though the latter has not been acted on by light, and reduces it also, and so the process goes on till the back of the film is reached. Captain Abney proved the fact that nascent silver so acts, by coating an exposed plate with a silver bromide collodion film over half its surface. On development, the half so coated was denser than the other portion, the extra silver having clearly been obtained from the imposed film which had not been acted on by light. The reason for this action can, as yet, only be conjectured, but it is probably caused by micro-electrolytic decomposition. If particles of silver are pressed into a gelatinobromide of silver film, and the film is developed without exposing to light at all, black spots appear, each particle having acted as one element of a galvanic couple, and reduced the bromide with which it is in contact.

Similar action takes place in developing a wet-plate negative, and whenever silver intensifiers are used, and very possibly causes the difficulty of getting line engravings copied.

R. C. M.

**Question 3.**—Write an answer to the letter of "E. A. D." on page 224, AMATEUR PHOTOGRAPHER, March 27th, giving your experiences and opinions on the views expressed.

**ANSWER.**—Sir,—Some eighteen months ago I had arrived at the stage to which your correspondent "E. A. D." states he has come, and being directed by a good friend, made some experiments with the different developers, using some two dozen quarter-plates, and cutting each in three (for pyro, hydroquinone, and iron). I learned more than any amount of reading could teach, the result of which experiments were that, in spite of the nasty brown finger, I stuck to pyro, finding that you have so much more control over it than either hydroquinone or iron. Lately, however, I have seen some hand-camera exposures developed with a mixed developer of hydroquinone and eikonogen in proportions of one-third and two-thirds with the alkaline carbonates, which were so superior to mine taken at the same time developed with pyro ammonia (though in the prints there is less difference) that I have been giving it a thorough trial, and find that the mixture gives the advantages of both developers without their faults, as far as under-exposed negatives are concerned; but still you have not so much control as with pyro. Possibly further experiment may show that using the developers in different proportions may give the desired result. I strongly recommend "E. A. D." to sacrifice a few plates as recommended by Mr. A. Clark in experiments.—Yours, etc.,

S. N.

The following gentlemen have entered for the second competition:—"Lindum," "Yxol," "R. C. M.," "Photo-Maniac," "S. N."

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Ashton-on-Lyne.**—The Hon. Sec. writes: "You will no doubt be pleased to hear how the above society is progressing. We have secured excellent premises in Henry Square, which comprise a dark-room (now being fitted), reading and smoke rooms; also large room for lantern and other demonstrations, which will hold about 200 people, and the rooms throughout are splendidly furnished. We have a man and his wife who live on the premises as caretakers to keep the place clean, etc. The rooms are open from 9 o'clock a.m., and our membership is steadily increasing."

**Birkenhead.**—The usual monthly meeting was held on the 9th inst., the President (Mr. G. E. Thompson) in the chair. Mr. W. A. Norrish was unanimously elected a member. A paper was read by the Hon. Librarian, Mr. J. A. Forrest, on "Orthochromatic Photography," a paper which displayed a considerable amount of research. Mr. Forrest, who in the course of his remarks referred to the fact that he was a photographer of upwards of fifty years' standing, had experimented with several different brands of plates, both isochromatic and otherwise, treating the latter with various solutions to increase their colour sensitiveness; the results of his experiments he exhibited and explained at some length. The paper throughout was listened to with evident enjoyment by all. This was followed by a practical demonstration of the printing, toning, and manipulating of Obernetter and Aristotype papers, by Mr. E. M. Tunstall, the Hon. Secretary of the Liverpool Amateur Photographic Association. Mr. Tunstall dealt with the treatment of the prints from their removal from the printing frame to their being ready for mounting, practically demonstrating the various processes throughout. He also exhibited numerous finished results, showing the difference in tone attainable by different toning baths. These results were much admired by all present, special praise being given to those having a matt surface, having been dried in contact with ground-glass. A hearty vote of thanks having been accorded to Mr. Tunstall, the meeting was dissolved.

**Birmingham.**—An ordinary meeting was held on the 9th inst., Mr. W. J. Harrison, F.G.S., in the chair. Five new members were elected. The Hon. Secretary, Mr. A. J. Leeson, exhibited Wray's aluminium mounted lens fitted with Iris diaphragm; the lightness was remarkable and in point of finish perfect. The programme for ensuing session was read as follows:—April 23rd, "Exposure and Development," W. J. Harrison; May 28th, "Stereoscopic Photography," Walter Griffiths; June 25th, "Cameras and their Management in the Field;" July 23rd, conversation meeting and exhibition of survey photographs; August 27th, development competition; September 24th, "Lantern Slide Making," S. H. Fry. The Hon. Secretary (J. T. Mousley), Excursion Committee, read the list of excursions for the year. The Chairman remarked that he was glad to see the Excursion Committee had arranged for many of the outings to interesting spots in the Hundred of Hemlingford, which would greatly help the survey section in that important work. A demonstration on "Alpha Paper" followed.

**Brechin.**—The ordinary monthly meeting of the above was held on the 7th inst. On the invitation of the Committee, about one hundred ladies and gentlemen—friends of the members—were present. Through the kindness of the Editor of the AMATEUR PHOTOGRAPHER, the Prize Lantern Slides of the 1890 Competition were exhibited. They were arranged in four classes: (1) landscapes, (2) figure subjects, (3) animals and instantaneous, (4) architecture. The whole of the pictures shown were much above the average. Some, indeed, if not perfection, approached very close to it, notably the pictures of Mr. Austin, the winner of the Gold Medal in Class 2. Mr. A. R. McLean Murray occupied the chair, and read the notices on the various pictures, and the Treasurer, Mr. Wm. Stewart, jun., attended to the lantern, etc.

**Brixton.**—An ordinary meeting was held on the 9th inst., Dr. Reynolds in the chair. The general business having been disposed of, Mr. Bevins, one of the members, gave a lecture on "Light," illustrating his remarks by diagrams and experiments with the aid of the club lantern, giving instructions for testing the safety of glass for dark-room lamps by means of a prism. The annual club exhibition of members' work will be held at Gresham Hall, Brixton, on Friday and Saturday, the 17th and 18th inst. Lantern shows will be held each evening, and a concert on Saturday.

**Croydon.**—The ordinary meeting was held on the 13th inst. The following gentlemen were elected members: Messrs. Nathaniel Waterall, W. E. Samson, J. Baldock, and W. H. Brown. The prize winners at the late exhibition explained in detail how the winning marks were produced; the explanations inducing much profitable

discussion. The first of the weekly Saturday afternoon excursions of this season will be on the 25th to Dorking, in charge of Mr. G. R. White. The next ordinary meeting will be held on the 27th, subject: "Carbon Printing Processes," by the Autotype Company. The chair was filled by the President in the first part of the evening, but later on, in consequence of Mr. Maclean's indisposition, by Mr. C. F. Oakley. The negative of the view which took the President's medal for the best picture, irrespective of size or subject, was taken on one of Thomas's plates.

**Croydon Micro.**—An extraordinary meeting was held on the 10th inst., Mr. J. H. Baldock, F.G.S., in the chair, when Mr. J. Weir-Brown explained and demonstrated his system of producing "Warm Brown Tones and Sepia Tones on Bromide Enlargements," particulars of which were contributed by him to the *British Journal of Photography* in January last. He had slightly but not materially altered his mode of procedure since the first publication of the process. A number of landscapes were handed round showing both brilliant and soft effects in rich brown and sepia. A discussion followed. Mr. W. Low-Sarjeant exhibited and explained a novel hand-camera which he has recently constructed for his own use. The camera measured externally  $8\frac{1}{2}$  by 7 by 6 in., and was composed of two chambers, the upper one being used for focussing and acting as a view finder, which gives a full-sized view of the picture which is being taken in the lower compartment. The picture was seen and focussed at the moment of exposure. The lower chamber, or camera proper, was fitted with a swing-back and focussing screen for ordinary work. It was also fitted with a specially constructed focussing eye-piece which entirely dispensed with the necessity for using a focussing cloth. Double backs of very light pattern were used, and the camera had a range of focus from 3 to 12 in. A very ingenious shutter was fitted behind the lens flange, giving a range of exposure from extreme rapidity to hours if required, and was pneumatically released, giving an equal exposure to every part of the plate. A novel feature in the shutter was that whatever speed the shutter was set to work at (even at its fastest) at the moment of exposure, without any alteration whatever to it, a time exposure of any length could be given. The camera, was also fitted with a black glass reflector for taking clouds, and when not in use folded into the front; a false bottom with arc struts facilitated the necessary tilting angle for cloud photography. The camera, though so small and compact, was capable of doing every class of work. The next meeting will be held in the old School of Art-room on Friday, 17th inst., at eight, when there will be an exhibition of hand-cameras. The first excursion of the photographic section of the club took place on Saturday the 11th, when, through the kind permission of His Grace the Archbishop of Canterbury, Addington Park was visited, the weather being nice and fine; some good work was done.

**Darlington.**—The usual monthly meeting was held on the 10th inst. There was a good attendance. Mr. J. S. Sinclair read a paper on "Platinotype," and developed several prints by means of the hot-bath process, which were a great success. This paper and demonstration was of especial interest, as very few members have hitherto worked in platinotype.

**East London.**—A special general meeting of this newly formed society will be held in the coffee-room of the "London Apprentice," 333, Old Street, London, E., on the 20th inst., at 8.30 p.m., when the rules drawn up by the provisional committee will be submitted for approval, etc. All photographers and other gentlemen are cordially invited to attend.

**Glasgow.**—The sixth general meeting of the session was held on the 3rd inst., Mr. William Lang, junr., F.C.S., President, in the chair. Mr. James Gardner gave a practical demonstration of the application of the air-brush for working up bromide enlargements, and prints were shown illustrative of the method. Mr. William Hume, Edinburgh, explained the construction and uses of his Cantilever enlarging apparatus, and by its means showed a series of physical experiments projected on the screen. Mr. William Lang, junr., F.C.S., read a paper on lantern slide making by the Woodbury process, and gave a demonstration of its working. Thereafter a number of members' slides were passed through the Society's lantern.

**Hackney.**—An ordinary meeting was held on the 9th inst., Mr. J. Hubert in the chair. The Hon. Secretary drew the members' attention to their new book-case, and hoped to receive books from the various members towards filling it. This being an evening set apart for hand-camera work by Mr. Walter D. Welford, some hand-cameras were shown, among them being the "Radial," which was explained by Mr. Dickenson, and the "Repeater" shown by Mr. Cusworth. Mr. Gosling showed his, a home-made one with dark-backs. The Chairman then introduced Mr. Welford, who preferred to illustrate the uses of a hand-camera by means of the lantern by nearly 200 slides.

**Holborn.**—The usual weekly meeting was held on the 10th inst., Mr. T. C. Hepworth, F.C.S. (President), in the chair, when Mr. J. Traill Taylor gave a short lecture on "The Art Composition of Photography," illustrating his lecture by various photographs. Two new

members were elected. On Saturday twenty-five members attended the club outing to Waterlow Park and, in spite of the unfavourable weather, an enjoyable afternoon was spent on this estate at Highgate. The club is commencing its fourth year of existence in a very spirited manner, no doubt actuated by the success of the past year, its members having been increased to over seventy. Arrangements for the ensuing twelve months are being completed, and special attention is being given to the outings during the coming summer months. Outings to Richmond and Waterlow Park have already been attended, and during the months of May and June excursions have been arranged to Pinner, Panshurst near Tunbridge Wells, Purfleet, Hastings, and London Colney. Arrangements are also being made for a garden party in July. Another special feature of the year's arrangements is a monthly competition. During each of the summer months one print is to be sent in, and during the winter two lantern slides per month. Special subjects will be set by the Committee, and at the end of the two seasons prizes will be given to the members whose prints and lantern slides have received the best average of marks. The club meets every Friday, and one night a month is devoted specially to the instruction of beginners. Full particulars of membership, etc., can be obtained of the Secretary, Mr. J. Smith, 97, Tabley Road, Tufnell Park, N.

**Keighley.**—Under the auspices of the above association Mr. A. A. Pearson, of Leeds, delivered a lecture on "Photographic Chemistry," on Tuesday, 7th inst., before a good attendance of members and friends. Mr. Samuel Bairstow, President of the association, briefly introduced the lecturer. Mr. Pearson said the whole science of photography depended on the fact that certain substances are acted upon by light. They all knew how the sunlight faded the colours of their carpets, curtains, and upholstery, though very slowly; the bright aniline dyes with which many silk ribbons were dyed lost their colour more quickly. The green colouring matter of vegetation was a compound called chlorophyll, which was formed in the presence of white light, so that they had colours formed by light; whereas in the case of dyes the colours were destroyed by light. Those processes were very slow, extending to days and weeks, but there were certain metallic salts, notably some of the salts of silver, which showed a visible colour-change in sunlight in a few seconds, and furthermore underwent an invisible change (which could, however, be rendered visible by the action of certain chemicals, termed developers) in less than the 5000th part of a second. He had a photograph which he had taken of a single spark from a high tension electrical machine, which could not possibly have lasted the 5000th part of a second. It was a wonderful thing that a substance which would keep indefinitely in the dark and remain unaltered a considerable time in a red or yellow light, should have its nature changed by exposure to white light for a shorter time than it would take a person to wink. It was his purpose that night to investigate that change and explain its theory. In order to do that he would perform several experiments in visible changes, and argue from the visible to the invisible. As he previously mentioned, the substances most useful to the photographer were certain salts of silver, and those most readily altered by light were the compounds of that metal with three halogen elements: chlorine, bromine, and iodine. The lecturer fully demonstrated the properties of the halogen elements by several lucid experiments. The lecturer went on to explain, first the chemical changes that took place, and secondly the action of light in bringing about these changes.

**Leicester.**—A regular meeting of the Society was held on the 8th inst., Mr. Frank G. Pierpoint, V.P., in the chair. The ballot was taken for one gentleman, who was unanimously elected; one gentleman was proposed and seconded for ballot at next meeting. The excursions committee was then elected, consisting of Messrs. Pierpoint, Porritt, Bankart, and Wilson, who were requested to make a recommendation to the next meeting of places and dates for the Society's outdoor meetings for the coming season. Mr. Porritt then proceeded to read his paper entitled "Photography, Past and Present with notes on the quality of dry-plates and lantern-slides, and a few remarks on the object of our excursions." During the course of his remarks Mr. Porritt in a very able manner reviewed the practice of photography, from the earliest date of collotype and wet plate processes, describing, in passing, the modus operandi of each process, which was quite new to the greater part of the members; from thence he traced the gradual transition through the various dry processes to the almost perfect condition attained by the present dry-plate. Lantern plates were then treated, the lecturer betraying a considerable leaning towards the collodion-made slide, some excellent specimens of which were passed round. Some very good advice to the members with respect to the management of the forthcoming excursions was then offered by Mr. Porritt, who concluded a very useful, crisp, witty paper, which will remain as an excellent pattern for imitation for the members of the Society. The President, Mr. Pierpoint, in proposing a hearty vote of thanks to Mr. Porritt, traversed at some length some of the points advanced by him with reference to the use of rapid v. slow plates for landscape.

**Lewes.**—An ordinary meeting was held on the 7th inst. Certificates for success in the quarterly competition were presented to Mr. Percy Morris and the Hon. Secretary. The slides sent in to the quarterly competition were passed through the lantern, the Vice-President, Mr. J. Tunks, being awarded the certificate. A number of members' slides were then passed through the lantern.

**Liverpool.**—The second monthly meeting was held on the 8th inst. After a few words from the Secretary upon the objects and programme of the club for the session, a committee was formed to arrange for the afternoon excursions. Mr. W. A. Brown then gave a demonstration on "Hand-camera Work," and exhibited his home-made camera and many of his negatives and lantern slides. Several other members had brought hand-cameras and negatives, which were handed round for inspection. It was decided to have a Wednesday afternoon at Southport and a Saturday afternoon about Sefton during the next fortnight. The next meeting will be held on May 13th, when a demonstration will be given on "Contact Printing."

**Morley.**—A meeting was held on the 7th inst., the Vice-President, Mr. J. Sanderson, in the chair. Members passed round work, done during holidays, which was duly criticised. It was then resolved to have a ramble to Adel on Saturday afternoon, the 18th.

**Newcastle-on-Tyne.**—The next meeting will be held on Tuesday, the 20th inst. Paper and demonstration on "Carbon Printing" by J. Hedley Robinson.

**North London.**—A meeting was held on the 7th inst., the Rev. E. Healy in the chair. Mr. A. P. Wire, Hon. Librarian to the Essex Field Club, gave his new and interesting lecture upon "The Great Road from Aldgate to Colchester," illustrated by views in the optical lantern, many of them being copies of very rare prints. This lecture was a great treat to the society in more ways than one. Not only is Mr. Wire a most enthusiastic and accomplished historian and archaeologist, but he is also an excellent amateur photographer, so that he was able to illustrate his lecture by slides, most of which were his own work, either being copies of rare old prints, lent him by friends, or direct from his own negatives, and consequently many hints were given, in the course of his two hours' lecture, upon the manufacture of the slides, and the lecture was enlivened by anecdotes of the adventures of an amateur photographer. Mr. Wire is brimful of historical, geological, and geographical lore, and had spared no pains in preparing this lecture. The information which accompanies the exhibition of the slides has been gathered from all sources—the British Museum, the libraries of old country houses, and personal investigation—and, in fact, the lecture was a model of what an industrious amateur photographer, with a taste for research, can do by devoting his energies to some particular subject, and following that conscientiously and earnestly. Mr. Wire has an excellent chatty way of delivering his lecture, which, being interspersed with anecdotes, cannot fail to interest and instruct all who may have the pleasure to listen to it. A hearty vote of thanks was accorded to Mr. Wire for his lecture and the exhibition of his new tinted slides.

**North Middlesex.**—The last meeting was held on the 13th inst., Mr. J. W. Marchant in the chair. Mr. Birt Acres read a paper on the "Monochromatic Rendering of Colours by Photography." He said the subject naturally divided itself into two portions—the historical and the practical. He gave a chronological resumé of the growth of photography, and of the researches into colour-sensitive dyes for the photographic plate. The early workers had attempted to secure the colours seen on the ground-glass screen in various ways. Some had tried to obtain reproductions of the colours separately, and to combine them into a whole, and had used glasses of various tints to separate the colours. A difficulty met with was the reflections from every coloured object of white light. He then dealt with the colour-sensitive dyes which had been tried—eosine, erythrosine, chlorophyl, etc., etc.—and said that the addition of ammonia, discovered and patented by Tailfer and his colleagues, had been the factor necessary to secure success. By means of a prism the lecturer projected on the screen a spectrum of the oxy-hydrogen light, showing the colours in great brilliancy. He pointed out that the ray which was lightest in tone to the eye was yellow, the others following in the order of light blue, green, orange, red, and deep blue and violet. The rays when photographed upon any ordinary plate were more or less reversed, the blues and violets showing brightest. He then interposed coloured screens of various tints, showing how they cut off various rays. A series of monochromatic bands were then thrown on the screen, showing the spectrum photographed on ordinary and colour-sensitive plates with and without coloured screens. The series showed clearly that a very pale yellow screen, necessitating about a triple exposure, gave results in monochrome, most nearly approaching the effects of colour as seen by the eye. Copies of paintings, portraits, and views taken in duplicate on ordinary and isochromatic plates were then thrown on the screen. The lecturer said that the difference in the cases of the portraits and the copies of oil paintings was so marked that he found it necessary to state that no retouching had been done.

The views taken on ordinary plates were so good that it seemed nothing better could be wished for, yet when the duplicate taken on the isochromatic plate was shown, the improvement was strongly visible. Mr. H. Smith reported that he had tested the "Barnet" plates sent by Messrs. Elliot and Sons, and had found them of good quality. He also exhibited prints upon "Celerotype" paper, the fineness of the image obtained being much admired. Samples of plates, instantaneous and ordinary, sent by Messrs. Marion and Co., and samples of Dr. Jacoby's chloride of silver emulsion paper sent by Mr. O. Scholzig were distributed to be tested and reported upon.

**Oxford.**—At the meeting on the 17th inst., Mr. A. F. Kerry, M.A., Exeter College, gave a very instructive lecture on "Bromide and Kallotype Paper Printing." The lecture, which was illustrated by various chemical experiments, was accompanied by the making, development, etc., of several prints; there was also a large number of bromide prints, representing under and over exposure; different developers used, thin and dense negatives. After this, the lecturer explained, rather briefly, as it was getting late, the working of the kallotype process. There were twenty-two members present. Mr. Claude Rippon (Merton College) and Mr. H. H. Isons were elected members. One name was proposed.

**Paisley.**—On the evening of the 6th inst. the Society gave a lantern exhibition in the Good Templar Hall. There was a large audience, the chair being occupied by Mr. Stewart Clark, of Kilnside. In his introductory remarks the Chairman referred to the great advances made in the science and art of photography. He remembered about forty years ago seeing his father making his first attempts at photography. The apparatus he used was very primitive indeed, being, in fact, an old camera obscura about the size of a cigar box. He had besides to manufacture his own lenses and prepare his chemicals. Photographers nowadays escaped all the hard and dirty work which the old wet process entailed. The Society in Paisley had done wonders, and it was much to their credit that they had enlisted so many young men, and he hoped young ladies also, into the practice of photography. It was a most entrancing art, and every person who engaged in it became a perfect enthusiast. The exhibition of slides was then proceeded with. The slides in competition by the members of the Paisley Society for silver and bronze medals were shown. This competition included slides by Messrs. Mure, Kilpatrick, Dunn, Thomson, Taylor, Easton, and Jack.

**Peterboro.**—The monthly meeting was held at the Museum on the 6th inst., when Mr. A. C. Taylor read a paper on "Artistic Photography," based on Robinson's works on the subject. There was a good attendance, and the paper was earnestly discussed by most of the members present.

**Putney.**—A meeting was held on the 8th inst., the Rev. L. Macdona in the chair. The set of American slides were exhibited to members and friends. They were greatly admired, those of the ruins of Johnstown being of special interest. It was suggested that had particulars as to plate and developer used, etc., been given in each case, instead of the maker's name, it would have been of greater interest to photographers on this side. The ingenious method of packing was also commented upon.

**Richmond.**—The meeting on the 10th inst. was made an extra lantern night for the purpose of exhibiting the American slides, and for deciding the slide competition. Mr. Horrihan presided, and there was a large attendance of members and friends. The American slides were first shown, and evoked much interest, after which voting on the competition slides took place. Each competitor was required to submit one contact slide from each of three negatives supplied for the purpose by Mr. Cembrano, and the result of the voting was to place Mr. Ardaseer first and Mr. Garrett second; while Messrs. Davis and Ford tied for third place. The Society were again indebted to Mr. Cembrano for the loan of his lantern.

**Sheffield.**—The ordinary monthly meeting of the Photographic Society was held at the Masonic Hall, Surrey Street, April 7th, Mr. B. J. Taylor in the chair. After the ordinary business of the meeting it was arranged to have Saturday afternoon excursions, commencing May 9th to Oughtybridge, also that the first monthly excursion should be to York early in June, date to be arranged. After which Mr. Alleyne Reynolds gave his lecture "A Tour Round Iceland," which was illustrated by a large number of slides, the negatives and slides being made and taken by that gentleman after having made four trips round that island, which was greatly appreciated by the large number of members present.

**Staff. Potteries.**—A lantern exhibition and entertainment was given by the Society, assisted by the Sneyd Recreation Society Amateur Minstrel Troupe, several of whose members are also members of the Society. The exhibition consisted of a number of slides from the Society's collection, together with some made specially for the occasion, including slides of the master and matron, groups of the inmates, some of the guardians, etc. The minstrels gave a very good performance of the usual minstrel order. The whole entertainment was much appreciated and enjoyed by the inmates and a number of visitors who were present.

**West London.**—An ordinary meeting was held on the 10th inst., the President, Mr. W. A. Brown, in the chair. The President invited the co-operation of all the members, with the object of making the annual smoking concert, to be held on the 8th of May next, a success. Slides were then put through the lantern by the Hon. Lanternist, the following members showing slides: Messrs. Bennett, Chang, Dixon, Hodges, Kellow, Lamley, H. Selby, L. Selby, Varden, Whitear, C. Whiting, and H. F. Wilson.

**West Kent.**—A special meeting was held on the 8th inst., Mr. A.

R. Dresser (the Vice-President) in the chair. Mr. W. J. E. Clarke was elected a member. The club monthly outings were then discussed and dates fixed, the first being arranged for Saturday, 9th of May, to Rochester and district under the leadership of Mr. Jones. Mr. W. R. Reffell was then called upon for his paper on "Lantern Slide Making," which was illustrated by the lantern, and listened to with great interest, and contained many valuable hints to the practical worker. Slides by Messrs. Court, Foy, and Grant were also passed through the lantern.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4817. **Antwerp and the Hague.**—(1) What is the average cost per day at middle-class hotels in Antwerp and the Hague, and can ten days be spent profitably in these cities? (2) Are there any good interiors, woodwork especially, and is there much difficulty in obtaining permission to photograph same? (3) Can any reader say from experience which is best—to go by Cook's or on your own independent tour?—**WOODPECKER.**

4818. **Adhesive Mounts.**—Can any reader tell me who now manufactures Wolff's patent adhesive mounts? Messrs. Harold Senior and Co., of Norwood Road, write that they no longer do so.—**SCOTIA.**

4819. **Development.**—Can any kind amateur inform me how to develop a bromide print in which local development has to be resorted to, for, owing to the print not lying quite flat in the developing dish, the developer is apt to spread over portions that are fully developed?—**W. R. P.**

4820. **Curled Mounts.**—I mount my prints whilst wet, which causes the mounts to curl up when dry. Can any one inform me how to prevent this?—**W. R. P.**

4821. **Development.**—A short time ago there was a letter in the **AMATEUR PHOTOGRAPHER** advising tourists when away from home to develop their negatives (but without washing beyond laying them in methylated spirit) or fixing them. Will some one kindly give the number of the paper or the formula?—**R. C. S.**

4822. **Photographing Sunsets.**—Would any of your readers kindly tell me if it is possible to photograph sunsets, and if so, what plate, exposure, developer, etc., is best?—**NOSTAL.**

4823. **Stained Negatives.**—I have some negatives that were intensified with mercuric iodine nine months ago, and now they will not print well, as there is a copper-coloured stain all over them. Can any one tell me the cause, and cure, if any?—**NOSTAL.**

4824. **Changing Bag.**—Can any one give me the directions for making a half-plate changing bag which is very strong and portable?—**S. J. LAWRY.**

4825. **Density.**—How can I, with Ilford pyro developer, increase density, after details are out? Must I add more of solution III.?—**FOREIGNER.**

4826. **Ilford Pyro Developer.**—Must the pyro developer, according to the Ilford formula, be made up fresh for each plate? Mine turns quite black after the first plate and seems not to work properly with a second one.—**FOREIGNER.**

4827. **Partial Intensification.**—How can I intensify part of a negative?—**FOREIGNER.**

4828. **Negative, Film Inside.**—I put a plate by mistake film inside into the dark slide; how can I get the original picture?—**FOREIGNER.**

4829. **Permission to Photograph.**—Is photography permitted in the South Kensington Natural History Museum and the Zoological Gardens, and if

so, whom should I apply to for permission, and what are the rules to be complied with?—**LUX.**  
4830. **Godstone's Print Washer.**—Can any one give me Mr. Godstone's address? Where can I get Houghton's test dark-room?—**C. C. MACKLEY.**

## QUERIES UNANSWERED.

April 3.—No. 4536.

„ 10.—Nos. 4602, 4604, 4608, 4709, 4611, 4615.

## ANSWERS.

4588. **Developer for Bromide Paper.**—Avoir-dupois weight.—**EDYLLION.**

4588. **Developer for Bromide Paper.**—I should say that they were apothecaries', but if not, it will not make much difference.—**ALPHA.**

4589. **Developing.**—Drop a card to Messrs. Edwards and Co.—**EDYLLION.**

4589. **Developing.**—The same proportions which you use for ordinary plates will do. You may please yourself which you use. As for me, I like quinol.—**CHESTER.**

4589. **Developing.**—Of 10 per cent. solutions take the following for Edwards's plates:

10 per cent. pyro solution ... 21 minims.  
" " brom.-amm. solution ... 5 "  
" " ammonia solution ... 20 "

to the ounce of water. Pyro is far the best for any negatives.—**ISIS.**

4590. **Pinholes.**—Prevention is better than cure. A well-known maker of plates states that a fertile cause is soaking the plate first in water. He advises pouring on developer straight away.—**ISIS.**

4593. **Lenses for Hand Cameras.**—The Club lens, made by Adams, is a very good one. Get their "Annual," and see for yourself.—**PORBUS ACIUS.**

4593. **Lenses for Hand Cameras.**—Taylor's (Taylor and Hobson, of Slate Street, Leicester) have a splendid reputation. Well-known workers use them. Their 6 in. detective and other lenses of same kind are to be recommended for fixed-focus work. Write for their catalogue; prices very reasonable.—**ISIS.**

4593. **Lenses for Hand Cameras.**—Undoubtedly the two best lenses are Ross' Universal Symmetrical and Optimus wide-angle Kuryoscope, the former 4½ in. focus, working at about  $f/5\frac{1}{2}$ , price £5, and the latter, 4 in. focus, working  $f/8\frac{1}{2}$ , price £3 3s. I prefer the latter, as I have a similar lens which answers admirably and gives a wide angle when required, which is a great advantage at times. The Ross would require stopping down to cover a quarter-plate, there would then not be much difference between them.—**EDYLLION.**

4595. **Lighting Backgrounds, etc.**—There is a capital article in last week's number on "Home Portraiture." For exposure, on a fairly bright day near window, I find 1 second, working  $f/8$ , on an Ilford extra rapid plate developed with two grains pyro with ammonia gives all detail and plenty of density.—**EDYLLION.**

4598. **Houghton's Tent Atelier.**—Houghton's address is 89, High Holborn, London, W.O.—**CHESTER.**

4599. **Lens and Shutter for Detective Camera.**—See answer to 4593.—**ISIS.**

4599. **Lens and Shutter for Detective Camera.**—See answer to 4593.—**PORBUS ACIUS.**

4599. **Lens and Shutter for Detective Camera.**—Shew's Eclipse repeating shutter, made by Shaw and Co., 87, Newman Street, W., would suit you, as it never requires setting. For lenses, see Answer 4593.—**EDYLLION.**

4600. **Watkins' Exposure Meter.**—Capital meter for camera exposures, but no use for printing. The Autotype Company will provide you with a suitable one for use with silver paper, or any firm will get it for you.—**ISIS.**

4601. **Matt-Surface Paper.**—Scholzig's is first-class; address, 31, Binfield Road, Clapham. On the contrary, he at all events says do not wash in more than one water. Use his toning formula. Detail is lost in all matt papers to some extent.—**ISIS.**

4601. **Matt-Surface Paper.**—Obernetters make a good and reliable matt-surface paper. Almost any toning formula will do. You must in all cases print deeper than ordinary paper. It is possible your fixing bath was too strong; 20 per cent. is quite strong enough. It is better to give a little washing before toning. If you do not care for the purple tone, print under green light.—**IKKO.**

4601. **Matt-Surface Paper.**—I should advise "Sutton," if he wants silver paper, to try the Blackfriars Co.; but why not try bromide? I find the following a very good bath;—

Chloride of gold ... 1 gr.  
Acetate soda ... 30 "  
Water ... 8 oz.  
To be prepared one day before use. Or, toning and fixing:—

Chloride gold ... 1 gr.  
Phosphate of soda ... 15 "  
Sulphocyanide ammonium ... 25 "  
Hypo ... 240 "  
Water ... 2 oz.

The prints ought to be washed before toning.—**FRIDA.**

4601. **Matt-Surface Paper.**—J. R. Gotz, of 19, Buckingham Street, Strand, sells a very good matt-surface paper. A combined toning and fixing bath is not so likely to produce such permanent results as when used separately, on account of the liability of a certain amount of sulphur toning. Why not use the uranium bath? It is cheap and gives capital results. I give the instructions from Wall's "Dictionary" in case you are not able to refer to it.

Chloride of gold ... 4 gr.  
Nitrate of uranium ... 4 "  
Chloride of sodium (salt) ... 60 "  
Acetate of sodium ... 60 "  
Distilled water ... 32 oz.

Neutralise the gold and uranium previously dissolved in a little water with bicarbonate of soda. The prints should be rather deeply printed and washed free from silver and then toned. This bath gives fine blacks and with plain or matt-surfaced papers the results can hardly be told from bromide prints. The following is the best fixing bath for this, and the prints should be washed in salt and water after toning:

Hyposulphite of soda ... 2 oz.  
Salt ... 1 "  
Bicarbonate of soda ... 1 "  
Water ... 1 pint.

—**EDYLLION.**

4603. **Hand Camera.**—If your camera is Lancaster's Instantograph, he supplies, I think, a case for it. I daresay it would fit any other quarter-plate camera.—**FRIDA.**

4603. **Hand Camera.**—Re adapting quarter-plate camera for hand purposes. If "J. H. W." will write me, through the Editor, I will give him particulars of a box I used with one of Underwood's quarter-plate Instantos, which I wish to dispose of.—**SHOTS.**

4605. **Washing Soda Developer.**—I should prefer to use pure anhydrous carbonate of soda, which does not give such yellow negatives as "washing" soda; and take enough with you on starting, about 5 or 6 gr. to the ounce of developer is sufficient unless the exposure has been very short, when it can be considerably increased.—**EDYLLION.**

4605. **Washing Soda Developer.**—Try formula recommended by Mr. Paul Lange, which is:—

Washing soda ... 2 oz.  
Bromide ammonium ... 20 gr.  
Water ... 16 oz.

For use take ½ oz. of above, make to 2 oz. with water, and add, for landscape, 4 gr. dry pyro, portrait, &c. 2 gr. The colour is a yellow on completion, and gives negative a thin look, but, on printing, will be found different. Would strongly advise you to use Powell's pyro developoids, which are accurately weighed to 2 gr. in each pellet. His advertisement appeared in last week's **AMATEUR PHOTOGRAPHER**.—**IKKO.**

4606. **Rapidity of Lenses.**—I think you will get better results with a R.R.; they are frequently used by professionals in preference to a portrait lens. Watson's half-plate R.R. works at  $f/8$ ; a lens working at  $f/4$  will require one-fourth and at  $f/6$  one-half the exposure of the R.R.—**EDYLLION.**

4603. **Rapidity of Lenses.**—The rapidity of a lens depends on the size of the aperture at which it is worked. If your lens has a full aperture of  $f/8$  you would find a portrait lens working at  $f/6$  twice as rapid, and one of  $f/4$  four times faster. For heads and half lengths you would do better with a good portrait lens.—**ISIS.**

4606. **Rapidity of Lenses.**—Portrait lenses for amateurs who only take them for amusement is quite a mistake. Your R.R. lens, working presumably at  $f/8$ , ought to be fast enough for such work, and, beyond rapidity, nothing gained. Then landscapes cannot be taken with them, and they are a sort of white elephant.—**IKKO.**

4607. **Mounting Prints.**—A beginner will find a weak solution of gelatine cleaner and in every respect better than starch. Soak the print for ten minutes and apply gelatine with flat brush.—**SCOTIA.**

4607. **Mounting Prints.**—I should advise "Beginner" to purchase a bottle of Percy Lund and

Co.'s professional mountant. I got some the other day from the firm, and I consider it one of the best, if not the very best, mountant in the market. It never curls the mount, nor does the print leave its position after being squeezed on to it.—**EXPERIENCE.**

4607. **Mounting Prints.**—Do not give up starch. Nothing to compare with it. But make it right. Cover the bottom of a tea-cup with knobs of starch, pour on a very little cold water, just enough to make a thin paste like cream, get all the lumps out of this with a spoon, then with a kettle of boiling water pour on with one hand and stir rapidly with the other till it turns to a jelly; after cooling a little it is fit for use. Don't make the jelly too stiff or the reverse. Damp the prints first, apply with a flat brush (camels-hair), and don't use too much. When laying on the mount, curve it down from the middle and with a clean handkerchief smooth away any bubbles from the centre to the edges.—**ISIS.**

4610. **Bromide Paper.**—Cut a little strip off and expose, and then develop, but you can generally tell by the coated side curling inwards; the same applies to plain paper.—**R. E. S.**

4610. **Bromide Paper.**—If "Power" will apply the tip of his little finger to the corner of the paper he will find that the sensitised side in each case is adhesive.—**SCOTIA.**

4910. **Bromide Paper.**—Has a tendency to curl inwards on the sensitised side. Matt paper is harder to judge, but examine it carefully by reflected light and look along the surface. The sensitised side will show of a more dead white, the reverse side showing more the texture of the paper.—**ISIS.**

4610. **Bromide Paper.**—If "Power" will feel the edges of any ready-cut paper, he will find it slightly curled by the cutting machine; the concave side is the sensitive side.—**A. J. SMITH.**

4610. **Bromide Paper.**—Hold it by the corner for a minute, when it will slightly curl. The inside is the sensitive side. Matt paper is generally rolled sensitive side inside; if flat, cut off a small strip and expose it.—**EDYLLION.**

4612. **Dark Slides.**—Tylar's are reliable, and well worth buying.—**EIKO.**

4612. **Dark Slides.**—Try Tylar's metal slides; they are, I think, the best. A set of six quarter-plates will cost 15s., to be had from W. Tylar, 57, High Street, Aston, Birmingham.—**THE SHARP 'UN.**

4612. **Dark Slides.**—Tylar's dark slides are the best; they are quite reliable and light tight, so far as my experience goes. Price for six slides with adapted screen, 15s. Tylar's address is 57, High Street, Aston, Birmingham.—**EDYLLION.**

4613. **Barnmouth and Neighbourhood.**—If "G. W. B." likes to write to me (address with Editor), I shall be pleased to tell him all I know about the district, as I stayed for some weeks in the neighbourhood last summer. I don't know about a dark-room, but I should think the local photographer would allow the use of it as it would not be a very busy time just now.—**EDYLLION.**

4614. **Eau de Javelle.**—This is really of little use; in fact, all hypo eliminators are delusive. If there is a choice, peroxide of hydrogen is the better, but it must be used very weak (*vide* Wall's "Dictionary"). If your water supply is deficient, print by platinum-type method, as less washing water is thus required.—**EIKO.**

4616. **Stops for Lenses.**—To get the diameter of your stops, divide the focal length of your lens by the focal number of your stops.—**R. E. S.**

4616. **Stops for Lenses.**—Focus sharply with full opening; then measure the exact distance from the diaphragm slot to the ground-glass, then make your stops with apertures bearing the following proportion to that distance, viz.:  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ ,  $\frac{1}{6}$ ,  $\frac{1}{8}$ ; these will then represent the following numbers of the uniform system of the Photographic Society: 16, 32, 64, 128, and 256.—**EDYLLION.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED: AM: PHOT.**

**NOTE.**—In this column we cannot advise upon purchase of APPARATUS, PLATES, PAPER, or PHOTOGRAPHIC MATERIALS.

Advice will be given upon questions of "Photographic Procedure," negatives and prints will be criticised, and every help given to the worker in photography.

H. H. COBB.—(A) Yes, the papers are the same, we believe. (B) Pour it back into the bottle and add fresh gold in the proportion of 2 gr. to every sheet. (C) Yes. (D) Certainly, the results are more brilliant and decidedly superior. (E) We do not think there is much choice in the matter; 3, 2, 1, 4, perhaps.

MONTAGUE.—Can you not call upon us one Monday from two to five, when we could explain more fully

to you? If not, send us a stamped directed envelope and repeat your query and we will write you.

OBERKREITER.—You did not carry your toning far enough. For purple tones it is necessary to carry the toning till the print shows no sign of red in the shadows when held up to the light and looked through.

J. W. HUNTER.—We have no prints from you now. The bromide prints are over-exposed and over-developed.

R. HARTLAND.—Letter by post.

C. J. EVANS.—Your negative is well exposed and we should say slightly under-developed, consequently the print is slightly wanting in contrast.

TE WIRIMU.—Let us know what lenses you have. The print you enclose would certainly have been much improved by stopping the lens down, and we think you have used a little too much reducing agent (pyro or hydro) in the developer, so as to make the petals too white in some cases. In photographing such a near object, have you taken into account the increase of focal length and consequent decrease of ratio aperture, a very important point in calculating exposure? On hearing from you we will write or answer next week.

J. H. HARDY.—We always prefer the bench breast high, so that we can sit at our ease on an ordinary office stool or high chair and develop without getting tired, or breaking our backs by stooping over a low bench. We would also suggest a folding flap underneath the window, which can be supported, when used, by two iron rods, for the support of camera and easel for enlarging. Two or three shelves for bottles, plate boxes, etc., would be handy, and a small bench opposite the developing bench, to be reserved solely for filling dark slides, etc., thus obviating any chance of contamination from chemicals; this might also be a flap to drop down. We shall be pleased to give you any further assistance.

YXOL.—(1) You entirely omit any mention of the acid boiling method, and also the cold emulsification process, both of which are specially suitable for amateur workers. (2) You hardly grasped the fact that the examiners wanted particular instances of such action. (3) Why no answer to this question?

PHOTO-MANIAC.—(1) See answer to YXOL.

S. N.—(1) See answer to YXOL.

R. C. M.—See Rule 4, please. (1) See answer to YXOL.

J. W. HAIGH.—The paper is made from Captain Pizzighelli's formula, with, we fancy, an arrowroot sizing. We do not know, of course, whether it is English make, but the sizes lead us to believe not, as the measurements agree with those of another paper of foreign make. The paper is always less sensitive in winter than in summer, and the veiling flat images are due to general reduction of the platinum by damp and atmospheric influences. Could you not undertake the preparation for yourself? It is by no means difficult.

MUWA.—The correct amount of water for the citrate of soda restrainer mentioned in Wall's "Dictionary," second edition, page 219, is two and a-half ounces. There is no absurdity about it. The solution is recommended to be kept in this concentrated form to avoid the growth of mycelium, which always occurs, and is extremely annoying in more dilute solutions. You will be pleased, no doubt, presently, to see your dilute solution grow well. If you follow out the directions given, you will find it correct in action. In the formula given on page 50, the correct quantity is ten ounces, the idea being to make a so-called 10 per cent. solution. The index to vol. ii. of the *Reporter* will be issued with the June number.

ABORIGINAL.—(1) You give us no idea of aperture of lens. Can you not send us up a negative, and then we will try and help you? Or if you will send us a negative and an exposed and undeveloped plate, we will see what we can do for you. (2) We should choose a No. 2 of 6 in. focus. (3) We prefer 3.

VEROX.—The best formula we can give you is Chapman's, of Manchester:—

Hydroquinone ...	...	...	40 gr.
Bikomen ...	...	...	120 "
Sodium sulphite ...	...	...	480 "
Citric acid ...	...	...	20 "
Distilled water, to	...	...	20 oz.

Potass. bromide ...	...	...	5 gr.
Sodium carbonate ...	...	...	60 "
hydrate ...	...	...	30 "
Distilled water, to	...	...	20 oz.

Mix in equal parts for use.

JOHN JAMES.—You may disregard the small blemishes in the lens; practically, they will have no ill effects on the image.

R. E. S.—Platinum toning is rarely successful on albumenised paper. No. 1 is bad. No. 5 is better, but looks as though you used too much acid. No. 6 strikes us as being from a poor thin negative; you can get blacker tones than this. No. 2 is all right. No. 3. Bath too strong. No. 4. Fair, but still it hardly comes up to what can be done. Try a plain paper, print deep from vigorous negatives, and then try. If your prints were well toned they certainly might stand a chance, especially 4 and 5. Do you want to sensitise albumenised or plain matt-surface paper? Our Competition prints are sent to individuals as well as societies. The amount of liq.

ammon. fort. should be 4 or 5 minims. Do you want your prints back?

AFRICANUS (Natal, S. Africa).—(1) Print rather deeply, and then use the following bath after well washing the prints:

Chloride of gold ...	...	...	15 gr.
Carbonate of soda ...	...	...	60 "
Acetate of soda ...	...	...	1 oz.
Distilled water ...	...	...	7 1/2 "

Dissolve your gold in half an ounce of water, add the carbonate of soda, and allow to stand for an hour; then add the acetate and remainder of the water. Keep this stock solution well corked in the dark and cool if possible. When required for use take half an ounce and mix with half a pint of hot water; when about 70 degs. to 80 degs. F., tone the prints and carry the toning till, on looking through them, there is no sign of red in the shadows, then fix in a solution of hypo at the same temperature (1 part of hypo to 5 of water), to every pint of which 1/2 oz. of carbonate of soda is added. The paper you are now using is a very good kind. (2) The mixture of ox-gall will keep almost any length of time and the peculiar, well, we'll call it smell, is characteristic of this preparation. Purified ox-gall, which also smells badly, may be obtained from any chemist, the trade name being *Fel Bovinum Purificatum*. (3) The three methods of marking diaphragms are—(a) the Ratio or *f/x* system, (b) the U.S., uniform standard, system of the Photographic Society, and (c) the Decimal, known as Dallmeyer's. The ratio system numbers are obtained by dividing the focus by aperture of diaphragm. The U.S. numbers take *f/4* as the unit and call it 1. The decimal system numbers are obtained by dividing the focus of lens by aperture of diaphragm, squaring the result, and dividing by ten. Thus focus of lens = 8 in., aperture of diaphragm = 1 in. =  $f/8$ ,  $8 \times 8 = 64$ ,  $64 \div 10 = 6.4$ , the number in Dallmeyer's decimal system. Always pleased to help you, especially as you are so far off.

BEGINNER.—"Experimental Photography" (Leaper), 1s.; "Amateur Photographer's Annual," 1s.; both to be had of our publishers.

X. Y. Z.—We have no knowledge of such a firm. All photographers for the Government service are, we believe, appointed from the Chatham School of Engineering.

H. S. W. E.—We know of no one who loans hand-cameras, but you might send up a query for our "Queries and Answers" column. Certainly 5 by 4 is a better size. Finders should be on top and side of a hand-camera.

FLETCHER HILL.—Will reply next week.

DEVELOPID.—Thanks for your letter. We will see what can be done about the certificate.

ANCELL.—(1) With books the copyright holds good for forty years. (2) At the copyright office, Stationers' Hall Court.

## Quarterly Examinations in Photography.

### QUESTIONS.

- What is the meaning of the terms "Isochromatic" and "Orthochromatic," and which is correct? State the theory involved in orthochromatic photography.
- What is the action of a mixture of bichromate of potash, hydrochloric acid and water on a dry plate before exposure, after exposure, and after development and fixing?
- Define the terms stop, diaphragm, F/8, U.S. No. 2; and give Dallmeyer's system of numbering the aperture of diaphragms?

(Latest Day for Answers—April 27th.)

### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
- All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
- A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.
- Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.
- Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and

practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; and all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. **Halfpenny Stamps preferred.** A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits for goods** to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

**Advertisements** can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc. — AMATEUR PHOTOGRAPHER, October 6th, 1888, to present date, clean, perfect; who offers? — Miss Hands, Llanberis, North Wales.

**Backgrounds.** — Backgrounds for sale, two (exteriors), rustic stile, garden terrace, distemper on calico, price 6s. 6d. each; also Scholzig's graduated background, for bust. — Baxter, Bramley, Leeds.

**Bicycle.** — Safety, celebrated Ormonde, first-class machine, cushion tyres, balls all over, including pedals, condition good as new, and warranted faultless; take 8 guineas; very genuine bargain; approval. — Safety, 2, Tower Street, Ipswich.

**Camera, etc.** — Whole-plate camera (Rouch's), 3 double backs, tripod stand, two fronts, good order, only two years' old, excellent instrument; only £8. — H. Holt, Conservative Club, Liverpool.

Underwood's half-plate Instanto, five double backs, turntable, and tripod, new; 90s., or offers. — R. T. Walker, Balance Street, Uttoxeter.

Half-plate Instanto, no lenses, quarter-plate, folding tailboard, Instanto lens and shutter; offers; or exchange half wide-angle lens. — A. Rowe, Brighouse, Yorkshire.

Lancaster's half-plate Merveilleux, new, 1890; cash price 31s. — Smyth, 27, Gower Street, Peckham Rye. Whole-plate box camera, polished, new, with two double slides, swing back, adapted for quarter-plate lens, or using front lens of same, taking whole plate portraits or views; 15s. — Hooper, Cumberland Road, Hanwell.

Keynolds and Branson's 7½ by 5 parallel, long-extension, double pinion camera, three book slides, Eastman's roll-holder, Funnell's shutter, black leather bag for camera, and solid leather case for slides, only used once; cost £17 17s.; price £10 10s. — Smeeton, 13, Broomfield Road, Leeds.

**Cameras, Lenses, etc.** — Quarter-plate Lancaster's Instanto, with superior rectilinear lens, two double backs, and stand, complete, 26s.; very superior dark box for 7 by 5 plates, 2s. 6d.; strong lead-lined developing sink, cost 20s., price 10s. — J. D. Pearson, Chilwell, Notts.

Lane's improved 5 by 4 camera, three double backs, reversing frame, stand, Ross' lens; £4; or separately. — Searle, Walmers.

Lancaster's half-plate Instantograph camera, 3 double dark-slides, tripod, lens with instantaneous shutter, offers? Ross' half-plate portable symmetrical lens, 55s. — R. Heitcheus, 34, Longcross Place, Cardiff.

Hare's 5 by 4 new long-extension camera, reversible holder, three double slides, Eastman roll-holder, tripod stand, focussing cloth, view-finder, solid leather case, cost over £13, price £10; Dallmeyer's 5 by 4 rapid rectilinear, and Thornton-Pickard shutter, cost £5 8s. 6d., price £4 10s. All the above are absolutely new, bought last month, and sold on account of owner purchasing larger set; approval. — Apply to Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C.

Whole-plate Instanto camera, with three dark-slides, Ashford stand, Beck's R.R. lens, bag, etc., complete; will sell together or separately. — Crossley, Rodley, Leeds.

Lancaster's half-plate International camera, lens, dark-slide, and stand, 70s.; quarter wide-angle Rectigraph, 20s. — Cain, 2, Orrisdale Terrace, Cheltenham.

Lenses, cameras, printing frames, mounts, tripod stands, all surplus, less than half cost; list on application. — 1A, Lansdowne Road, Tottenham, N.

Lancaster's quarter Instantograph (1890), three double backs, rapid Rectigraph lens, tripod, and waterproof cases; cost £4 10s.; price £3 5s. — Arthur Hogwood, Plough Road, Rotherhithe, London, S.E.

Half-plate Lancaster's 1891 Instantograph camera, dark-slide, tripod, fitted rapid rectilinear lens, as new, for 70s. — 2, Hawthorn Villas, Slad Road, Stroud, Glos.

Collins' Pocket cameras in cases, 5 by 4 and quarter-plate, each with six double backs, also fixed focus hand-cameras, working with above backs, lenses, Ross' Nos. 2 and 3 portable and Shew's Eclipse; above equal to new; no approval. — Mr. H. Miles, 19, Kensington Crescent, W.

**Condenser.** — 12 in. condenser (by Ross); cash offers, or exchange good hand-camera. — Harry, 22, Ashton Street, Brighton.

**Hand-Cameras, etc.** — No. 2 Kodak, not a mark on it, in leather carrying case, cost £5 9s. 6d., cash £5 5s.; reason for selling, having larger size same make; three half-plate spools Eastman's stripping films, half-price. — Hibbert Bros., Norfolk Street, Sheffield.

Abraham's Ideal, cost £6 10s.; will exchange for quarter-plate camera and cash, or offers; gives good results, and nearly new. — Can be seen at AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

No. 4 Luzo quarter-plate hand-camera, with special R.R. lens, stops, and focussing arrangement, loaded for 50 exposures; cost £10 10s. three months ago; will take £6 10s. — Address Camera, Photographic Society, 15, Dawson Street, Dublin.

Hand-camera, made to order, 15 quarter-plates, focus every picture if necessary, no dark-slides, f/8; worth £10; only £5 10s.; can be seen any evening. — 52, Jermingham Road, New Cross.

Shew's quarter-plate Eclipse hand-camera and four double backs, tourists' case and sling, complete, in first-class condition, £4; stand to match, 10s. — A. Welch, Crossgate, Cupar.

Automatic hand-camera, for 12 quarter-plates, lens, shutter, and finder, complete, thorough working order, a bargain; 40s. — A. Mercer, 16, King Street, Sparkbrook, Birmingham.

Adams' Ideal, one movement; specimen free; offers? — H. Short, Perryn Road, Acton.

**Lenses, etc.** — Optimus 7 by 5 R.R. lens, good; 39s. — No. 135, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Optimus 5 by 4 wide-angle doublet, new; 23s. — Hawkins, Lorne Villa, Farnham, Surrey.

Hare's whole-plate changing box, in solid leather case, £3 5s.; Wray's whole-plate landscape lens, with Iris diaphragm, £2 8s. — Baird, 15, Lothian Street, Edinburgh.

Ross' No. 5 portable symmetrical, new last season. — H., 55, Val Plaisant, Jersey.

Wide-angle rectilinear (Steinhilf's), 5 in. focus, 50s.; pair of Grubb's single, 6 in., matched for stereoscopic work, 60s. — G. M. Iliff, 11, Martineau Street, Birmingham.

Wide-angle Wray's half-plate, scarcely used, splendid instrument; £2 5s. — Paterson, Victoria Crescent, Barnsley.

Half-plate lens, with Iris and shutter, as supplied with Instantograph; 15s. — No. 136, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Laverne's new celebrated 5 by 4 defective lens, as fitted to Ideal, 25s.; automatic shutter, for time and instantaneous exposures, never requires setting, fitted with pneumatic release and adjustable flange, 18s.; both nearly new. — Meadway, Vestry Hall, Church Row, Bethnal Green.

**Roll-Holder.** — Eastman's quarter-plate roll-holder, new, perfect; wanted offers. — Lingard, Draper, Bradford.

**Sets.** — Lancaster's quarter-plate International camera, leather body, lens, shutter, double slide, back and side swing, reversing back, horizontal or vertical folding stand, all complete in deal case; cost £2 10s. a few weeks ago; price £2; exchange

and cash for Lancaster's half-plate Instantograph set; approval; deposit each way. — Mace, Garden Cottage, Cheltenham.

Lancaster's quarter-plate Instantograph, with patent adjustable diaphragms and instantaneous shutter, only used few times, with universal 3 fold stand, two mahogany and three Tylar's double slides; buying half-plate; price £3 5s. — Naylor, 77, Cadogan Square, S.W.

For sale, an absolutely new photographic outfit, consisting of a 15 by 12 Spanish mahogany long-extension camera, with vertical and horizontal front, reversing frame at back, rack and pinion focussing, morocco leather bellows, three double dark-slides, very best construction, Black Band rapid rectilinear lens, solid leather camera case, lock and key, carrying straps, tripod, stand, and focussing cloth; property of a nobleman. — Can be seen at the Stereoscopic Co.'s, 108, Regent Street, London, W.

NOTE.—Entry forms now ready. Send stamped addressed envelope, endorsed "Competitions," The Editor, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, London, E.C.

Latest date August 22nd.

# "AMATEUR PHOTOGRAPHER" COMPETITION. PHOTOGRAPHY AT HOME.

**PRIZES FOR PAST WINNERS.**

One Gold, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal.

One Silver, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal.

One Bronze, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal.

**OPEN TO GENERAL COMPETITORS.**

Two AMATEUR PHOTOGRAPHER Gold Medals.

Two AMATEUR PHOTOGRAPHER Silver Medals.

Two AMATEUR PHOTOGRAPHER Bronze Medals.

Certificates will be placed at the disposal of the Judges should they see fit to award them.

**SUBJECTS.**

Any photographs are eligible which will come under the description of "Photography at Home"—portraits, figure studies, groups, tennis parties, etc.

Each competitor shall send in not less than four or more than eight photographs, and they will be judged upon their merits as a whole.

The prize pictures will remain the property of the Proprietors of the AMATEUR PHOTOGRAPHER, and for every photograph that it may be decided to reproduce in the "Photography at Home" Album (which will be published as soon after the announcement of the awards as possible) an unmounted print must be forwarded at once upon application.

No photographs that have been awarded the AMATEUR PHOTO-

GRAPHER medal, or obtained an award at any open competition or exhibition, will be eligible.

No name must appear on the face or back of the prints, but the title must be legibly written on the front of mount, together with the number referred to on the entry form. Prints may be by any process, or on any paper, and must be mounted.

All competitors will be required to sign a declaration that they are bona-fide amateur photographers, and that the whole of the work of the exposure, development, retouching (if any), printing, and toning has been done by them.

The competition is open to both ladies and gentlemen.

Each parcel must contain a stamped addressed envelope or label for the return of the photographs, otherwise they will be added to those collected for hospitals.

All Photographs must be endorsed "Photography at Home," and sent addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., on or before Tuesday, the 30th of June, 1891.

NOTE.—Entry Forms now ready. Send stamped addressed envelope endorsed "Competition."

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.*

OUR VIEWS.—Glasgow Photographic Exhibition—1890 AMATEUR PHOTOGRAPHER Prize Slides—Photographic Portfolio Club—Gas Regulator Explosion—Home Portraiture—Quarterly Examination—Jena Glass—Crystal Palace Exhibition.

LEADER.—Home Portraiture.

LETTERS.—Answer to Query 4,617, Antwerp (Jack o' Lantern).

COMMUNICATED ARTICLES.—Additional Remarks on Photography without a Lens (Maskell)—The Construction and Use of Photographic Lenses (Leaper).

NOTES.—Thursday Evenings at the Camera Club—Edinburgh Centre—Liverpool Centre.

REVIEWS.—Die Osthoskiographische Photographie, Bemerkungen uber Misserfolge und deren Abhilfe und Sammlung von Recepten (David and Scolik).

CRYSTAL PALACE EXHIBITION.—Apparatus—Awards in the Art Division.

APPARATUS.—The Parallel Trimmer—Walking-Stick Stand—Wood's Improved Washer.

SOCIETIES' MEETINGS.—Brighton—Cornish—Croydon Micro—Devon and Cornwall—Ealing—Guildford—Holborn—Haresden—Ilkeston—Jersey—Lewisham—Manchester—Richmond—Stockton—Toynbee—Wakefield—Wigan—Woolwich.

WE have before referred to the Photographic Exhibition which is to be held in Glasgow in September under the auspices of the Glasgow and West of Scotland Amateur Photographic Association. We have now before us the prospectus. It is intended to open the Exhibition on the 1st of September, and for it to remain open until October 3rd. We note that although the Association has followed very closely upon the model of the prospectus issued by the promoters of the Liverpool Association, in one particular there is a very marked difference, viz., "No restrictions will be imposed as to the date of production, or as to previous exhibition of any picture." The conditions then provide that pictures which have gained first award in any class at any open exhibition can compete only in the Champion Class. We also note that "only medals from the die of the Association will be awarded, and no medals for advertising purposes will be accepted." Classes are reserved "open to professionals only," and to "amateurs only," in the following subjects: Portraits, whole-plate and over (set of four); Portraits, under whole-plate (set of six); Enlargement, any size, portrait only (one only); Enlargement, any size, other than portrait (one only); Lantern slides, any subject, professional (set of twelve), amateur (set of six). All other classes are open alike to professionals and amateurs, and include Landscape, Marine and clouds, Animals, Outdoor groups, Architecture, Interiors, Still life (flower studies, etc.), Flashlight, Instantaneous—in all the above subjects sets of four are to be entered. In Hand-camera, sets of twelve; Stereoscopic transparencies, sets of six. Genre—

groups or figure studies to form principal part of the picture—one only. Scientific, Microscopical, Astronomical, Geological, Botanical, Zoological, etc., not less than four photographs to be entered.

In all there are to be twenty-five classes, and in each class a silver and bronze medal will be placed at the disposal of the judges, as well as two gold medals to be awarded for special merit. In the Champion Class, open to professionals and amateurs, two gold medals will be given. In the Lady's Competition a silver and bronze medal will be given for the best set of four pictures, any size or subject.

The executive are very anxious to make a good show in the photo-mechanical section. Sets of six pictures must be sent in, and the name of process must be distinctly stated. It may be interesting to give the condition referring to the "production of picture;" except in Classes 1, 2, 3, 4, and 5, which are open to professionals only, the whole production of the picture—including exposure, development, retouching, printing, and toning—must be solely the work of the exhibitor. In Classes 1, 2, 3, 4, and 5 these operations may be the work of employes, but must be done on the exhibitor's own premises. All entry forms must be sent in on or before the 10th of August addressed to the Hon. Secretary, Mr. W. Goodwin, 3, Lynedoch Street, Glasgow.

The Exhibition will be held in the Institute of the Fine Arts, the finest suite of rooms in Glasgow. There is no doubt that the Exhibition will be a great success. Any of our readers wishing for prospectuses may send us a stamped and addressed envelope, and we shall be pleased to forward a copy.

WE would remind our readers that the 1890 AMATEUR PHOTOGRAPHER Prize Slides will be shown at our offices, 1, Creed Lane, E.C., on Monday evening, the 27th inst., commencing at 7 p.m. Admission free on presentation of visiting card.

MR. F. G. READER, of 173, Hemingford Road, Barnsbury, N., asks us to state that he has vacancies for two members in the Photographic Portfolio Club, for which ladies and gentlemen are eligible.

WITH reference to the suggestion of Mr. Hodges that a committee should be formed to investigate the causes of the explosion of Mr. Brandreth's gas regulator, it is suggested that such meeting shall not be held for another month, in order that Mr. Brandreth, who is at present in America, may have the opportunity of attending. He is

very much interested in the matter, and, like ourselves, thinks that, for the safety of all lanternists, the cause should, if possible, be found out, and that it should be the subject of a most searching enquiry. We shall be glad to receive the names of any gentlemen who would be willing to meet and discuss the subject.

Our brief notes on "Home Portraiture" seem to have fairly caught on, we are pleased to see. On Monday afternoon last the influx of novices with questions and negatives was decidedly striking, and we have several letters this week from correspondents on the same subject, one suggesting that "your leader on 'Home Portraiture' is certainly an eye-opener." Our notes will be continued for some little time yet, and we shall be pleased to assist anyone by giving special directions as to the placing of sitters, etc., if they will forward us a plan of the room they propose to work, with dimensions of window, etc. Those of our readers who intend to enter the "Photography at Home" competition will perhaps obtain a few useful hints from the later articles.

THE gentleman who was successful in obtaining the third prize in our Quarterly Examination has intimated to us that he wishes to apply his prize in the purchase of some prisms of Jena glass, as he intends entering the interesting but rather laborious field of spectro-photography. He is the Hon. Sec. of the North Kent Amateur Photographic Society, and has for some time been anxious to enter the higher scientific branches of photography.

It is a little amusing to read the following note on Jena glass by a well-known photographic writer:—"Patents have been recently taken out by Drs. Abbé and D. Rudolph, of Jena, for the manufacture of a new glass for lens making. This new Jena glass, as it is called, has not yet been placed on the market, but lenses have already been made of it by English as well as foreign opticians." It would probably be of service to this writer if we inform him that this glass has been on the market since 1884, and since 1886 German opticians have manufactured lenses of it, and that we have had in our possession a price list with a sample of the glass since 1887. Drs. E. Abbé and D. Rudolph have merely patented special combinations of the new Jena glass, which give lenses far superior to the old ones. English manufacturers are naturally conservative, but they are slowly waking up to the fact "that this new Jena glass" which has been on the market since 1884 is a wonderful aid to them, and enables lenses to be devised much superior to the old glass. We shall presently have a note on this new glass, and hope to be able to show our readers practically the advantage of the new over the old.

THE explosion of the regulator referred to in our two last numbers is still occasioning considerable discussion, and several visitors have called to see the remains. The writers of most of the letters in last week's issue assume that the explosion occurred in the india-rubber regulator, whereas it appears to us that the explosion occurred first in the gun-metal connection above the bottle, and from there attacked the india-rubber. We may, of course, be wrong, but from the appearance of the relics this looks correct.

THE exhibition at the Crystal Palace is drawing large numbers of visitors, and Mr. Wollaston must be gratified to find that, notwithstanding somewhat adverse circumstances, it is such a success. The show of apparatus—which we

refer to at length on another page—is small in quantity, but excellent in quality, and includes all that the amateur wants, from the dark-room (Messrs. Houghton and Co.) to mounts for the finished prints, all the intermediate stages being well covered, the Platinotype Company even giving demonstrations of the hot-bath process. Amongst the pictures there are truly some which might have been relegated by their owners to the obscurity of a distant attic or elsewhere, but, on the other hand, the pictures which have received rewards (which we hope to refer to in detail next week) are in many cases pictures in the true sense of the word, and all give evidence of much care, skill, and artistic taste. The lantern shows have drawn large audiences, and the slides were on the whole very good, and the exhibition generally will, we think, hold its own with any of its predecessors.

### HOME PORTRAITURE.

EVERY amateur who wants to start portraiture will generally place his sitter as close as possible to the window, and is astonished to find on developing his plate that he has obtained a wonderful and fearful hybrid, with one side of the face black and the other white. To such a novice we propound the startling theory that the further he puts his sitter away from the window the softer and more harmonious the lighting and the better the results obtained. If he does not believe this, let him set to work to prove it optically and practically on himself, for which purpose all that is necessary is a decent-sized hand-glass or mirror, a chair, and the would-be operator. Now let him seat himself in the chair close to the window and hold the glass so that he can see his face plainly, and yet so that the glass shall not cast the reflection of the light on to the face, and he will find that one side of his face is brightly illuminated, but the other has a heavy black nose shadow, and the one ear is hardly to be seen. Now let the chair be moved back from the window about five or six feet, and the same operation be gone through, when it will be seen that there is less contrast between the light and shade, and we know we can further reduce this contrast by the use of reflectors. More is to be learnt by thus figuring about and admiring yourself and features in various attitudes and positions as regards the window than any amount of reading how to do it; but still, for the instruction of those who like everything illustrated, the following diagram, taken from the *Dictionary of Photography*, will be of some assistance.

A and B are two windows; B should be blocked out entirely by blinds or curtains, etc. The softest and most harmonious lighting may be got by placing the sitter about S, and the camera placed about C or H, according to whether profile or full face be required. For full lengths the camera will have to be placed about E.

Now for a few general hints on lighting, etc. Never put your sitter at F, in the above diagram, or directly opposite the window and the camera in the window recess: full-front lighting makes any face look like a plain, flat piece; there is no relief, no roundness, no shadow. Another important point is the character of the face, and the way this can be

altered by varying the position of the camera and lens. Let us take, for instance, a long, thin, cadaverous face, with abnormally long upper lip, and sharply-defined septum of the nose, with rather receding nostrils. Now let us place the lens level with the nose, and what do we see? Why, the lip and nostril natural, it is true, but too long and too prominent. Placing the lens so as to slightly look down on the nose and lip reduces these to pleasing proportions, whilst if we place the lens level with the breast, so as to look up to the nose and lip, the abnormal length is intensified. We might go on multiplying instances in this fashion, but must leave the operator to find these things out for himself.

Some people, especially those who do much head work or who have experienced great troubles or worry, have very marked furrows or furrow at the root of the nose between the eyebrows, and on either side a protuberance more or less marked, which give great character to the face, and which the possessors are sometimes very proud of. The face should be so lighted that these, or at least one, is distinctly visible, and a very good position is the profile just showing a little of the further eye. Another important point to be considered is the presence of scars, moles, and other marks; when these are present, it is of course absolutely necessary to take the other side of the face, unless, in the case of a fair sitter, when sometimes a small mole or beauty spot is very effective, giving piquancy to the face. A very good example of the effectiveness of a mole is to be seen in the frontispiece of the *Photographic Reporter* for February last, "My Sister," by F. W. Smedley, as fine a piece of artistic work as ever turned out by amateur or professional. All professional photographers and all authorities upon portraiture state that one side of the human face is better or more perfect than the other. Thus H. P. Robinson, the best known authority, in his excellent little book, "The Studio, and What to Do in it," p. 50, says, "The first thing to decide when you see your sitter should be, 'Which side of his face will make the best picture?' This consideration seldom gives an experienced operator any trouble. To one who is in the habit of observing, the sides of every face differ so much and in such a definite manner, that a glance is all that is necessary to settle the question; but the young photographer will want to know how to select and have some rule for the selection. If you will look critically at a full face (or the photograph of a full face would be better, as it would enable you to measure), you will find that the eyes are not level—one is higher than the other. This is almost invariable, and is one of the peculiar instances in which nature insists on variety, even where uniformity would seem to be proper. . . . I keep an illustrated catalogue of all the portraits I take, and on looking through several volumes . . . I found that about four out of five of the portraits were taken looking to the right, showing that I had in these instances chosen the left side as the best."

## Letters to the Editor.

### ANSWER TO QUERY 4,617—ANTWERP.

SIR,—Leaving Leeds yesterday for this place, I bought a copy of the *AMATEUR PHOTOGRAPHER* to read in the train, and found the inquiry of "Woodpecker" about Antwerp and the Hague. He can make a delightful round trip through these and other Dutch and Belgian cities in ten days, with one of the very cheap round trip tickets sold by the Great Eastern Railway Company, and will find all necessary information in the guide books published by that company. I usually stay at the Hotel de Hollande in Antwerp. The proprietor speaks English well, and my expenses there never exceeded 8s. a day. A man who knows the country well would do best to travel independently, as I have done for

thirty years; but for a ten days' tour with a view to using the camera, the tour Harwich, Antwerp, Brussels, Rotterdam, the Hague, Amsterdam, and back, by a Great Eastern Railway ticket, would be as much as could be managed. I found here a nice dark-room and large supply of English dry plates with Mr. Van Neck, Klapdorf, who also speaks English well. But for so short a tour it would be most convenient to bring all the photographic supplies needed from England, where I have found everything relating to photography cheaper and better than either in America or on the Continent of Europe. For lantern slides which cost me 1s. a dozen in England I have paid 1s. 9d. in Berlin and 3s. in San Francisco, and for Ilford dry plates 8 by 16 c.m., for stereoscopic purposes, I paid to-day 4½ francs or 3s. 7d. per dozen. In Berlin the same quality of German make cost me 2s. 7d. Goods of undoubtedly high quality—like, for instance, the excellent cameras of Dr. Krugener, of Frankfort—are quite as expensive as in England, and the cheap goods are "nasty."—Yours truly,

JACK O'LANTERN.

Antwerp, April 18th, 1891.

**Wakefield.**—On the 15th inst. the first meeting of the above newly-formed Society was held in the Old Town Hall, when an exhibition of lantern slides was given. Upwards of 140 members and friends were present. Mr. A. W. Stanfield, J.P., the President, explained the objects of the Society, and said he thought ladies as well as gentlemen should learn the art of photography. Fully 200 slides, lent by the Editor of the *AMATEUR PHOTOGRAPHER*, Captain Norwood, and Messrs. Hall, Eldridge, Webster, G. Parkin, H. A. Halliwell, Campbell, Day, and H. Parkin, were thrown upon the screen. The lantern was the property of Mr. Eldridge, and was manipulated by him in conjunction with Mr. Webster. The pictures, which included many local views, were much admired. The Editor of the *AMATEUR PHOTOGRAPHER* sent with the slides a collection of competition prints, and a special meeting was devoted to them on the night following, the members evincing great interest in the capital work so kindly sent for their inspection. The next meeting will be on May 12th, at 8 p.m., in the Market Cocoa Tavern.

**Woolwich.**—The first annual general meeting was held on the 9th inst. Mr. Harbour in the chair, and upwards of twenty members being present. In consequence of the rooms at present occupied being required by the Y.M.C.A., it was decided to hold the meetings in future at the schools adjoining Rectory Place Congregational Church, Woolwich, and to change the day of meeting from Thursday to Tuesday, the first evening in the new quarters being May 12th, when it was decided to hold an exhibition of members' work. The following officers were elected for 1891-2: President, Rev. J. W. Horsley; Vice-Presidents, Messrs. Harbour and Calder. Council: Messrs. Ince, Southin, Kemp, Aspinall, and Cregan. Hon. Secretary, Mr. G. K. Harris; Hon. Treasurer, Mr. Desforges; Auditors, Messrs. Brandon and Dering. Messrs. Hammant and Lumley were elected members. The Hon. Secretary then read the financial statement for the year, which showed a balance in favour of the Society of £1 3s. 11½d., which he considered very good when taking into account the various difficulties they had had to contend with. Arrangements were then made for the first outing on May 16th.

**Wigan.**—At the meeting on the 16th inst., the President (Rev. G. F. Wills) read a paper and gave a demonstration on the "Production of Lantern Slides by Reduction and Contact." The making of slides by contact with the negative was first dealt with, each operation being described in a very exhaustive manner. In dealing with reduction slides, the lecturer introduced to the notice of the members the apparatus made and used by himself, which is very simple; a few pence would cover the cost of the apparatus, excluding the camera and lens. It is made to screw on to the tripod, and may be pointed to the sky or any other position desirable, every necessary movement of the negative being provided for. After dilating upon the merits and demerits of the various brands of transparency plates, the lecturer gave a list of all the best known developing formulae, pointing out which he considered the best, and why. At this point several plates were exposed behind a negative, and developed with different developers by several members, the results obtained being afterwards compared, the general opinion being that the plates used (Thomas's) gave the best results with their own hydroquinone formula. It has been decided to form a lending library in connection with the Society. The books will be loaned to the committee by the members, and will remain the property of the latter, so that they may be withdrawn at any time. By this means the members will have most of the best works on photography at their disposal, without the expense of purchase, and without any outlay on the part of the Society. Already about thirty books have been promised, including all the standard works on the art-science.

## Additional Remarks on Photography Without a Lens.

BY ALFRED MASKELL.

PHOTOGRAPHY without a lens or, as it is popularly known, *pinhole* photography is a branch of the art which I think interests a sufficient number of people to warrant a few additional remarks being made to my paper in the *Photographic Quarterly* of October last. Although at present the examples which we meet with at exhibitions are contributed by one or two only, I know that many others are impressed with the merits of this method, and are working steadily in the same direction. I propose in this paper to give shortly some practical hints regarding the best way of working, more especially as to apparatus, quality of definition and duration of exposures.

*The Pinhole Plate.*—Various makeshifts will readily suggest themselves for the construction of the plate which carries the necessary aperture, but when we consider that the accurate piercing of this opening and the relation which it should bear to the focal length employed have an important bearing on the results obtained, it is undoubtedly convenient, if not indispensable, that this portion of our simple apparatus should be constructed in the best possible manner.

The most handy form of instrument for the purpose which I have come across has been brought out by MM. Deshors and Deslandres of Paris, and may shortly be described as follows. In the back view (fig. 1) we have a circular metal plate pierced with six apertures, viz.,  $\frac{1}{16}$ ,  $\frac{1}{8}$ ,  $\frac{1}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ , and  $\frac{1}{2}$  millimetre in diameter (corresponding, roughly to  $\frac{1}{16}$ ,  $\frac{1}{8}$ ,  $\frac{1}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ , and  $\frac{1}{2}$  of an inch). Any one of these apertures is brought by the milled head A (fig. 2) to the opening B, above which appears at the same time in the opening C the fraction denoting the size of aperture in use. The square metal plate is easily adapted to the square lens holder with which cameras are usually furnished. The

FIG. 1.

apparatus appears to me to answer all requirements, except that of view finding, for which an addition, I think, could be made which I shall presently suggest.

I have already mentioned (*Photographic Quarterly*) that the diameters of the apertures to be employed vary according to their distance from the sensitive plate or, as we may call it, according to the focal distance, and I gave then a table showing a certain number of convenient distances and apertures. It may be as well to add that the theoretical rule upon which that table is based is as follows:—To obtain

the diameter of aperture to be employed which shall give the best definition possible, multiply the square root of the focal distance to be used by  $\cdot 008$ . Thus, at a focal distance of 25 inches,  $\cdot 008 \times 5 = \frac{1}{125} = \frac{1}{125}$  in. as the proper diameter of the aperture. I have no intention of entering into the abstruse calculations bearing upon this important part of our subject which have been given to us by Lord Rayleigh and by Captain Abney. But I am bound to say that while I accept the theory I cannot absolutely reconcile it with

FIG. 2.

practice, so far at least as my own practice is concerned. As I understand the papers contributed by these two eminent men of science, the conclusions arrived at vary considerably. Lord Rayleigh finds that the retardation from the centre to the margin of a pinhole should be taken as  $\frac{1}{4}$  of a wave length, whereas Captain Abney gives it as  $\frac{1}{2}$  a wave length  $\lambda$ , consequently doubling the necessary diameter of the aperture in relation to the focal length. I should not presume to offer an opinion upon a matter upon which scientifically I know so little. The question of extremely small or comparatively very large apertures no doubt affects the manner in which the theories are to be applied; but so far as I have been able to form a practical judgment from the exposures which I have made, I cannot say that I am convinced either that the application of the rule stated just now gives the greatest possible amount of definition, or that if the theoretical diameter is exceeded on either side very much less defined results will follow. What are scientifically called discs of confusion may not, however, pictorially speaking, have a corresponding meaning, and it may be useful to refer to Captain Abney's paper, read before the Camera Club (*Cam. Club Journal*, June, 1890), where he says that to use a pinhole much smaller than that which should give the sharpest results, produces much greater gradation, and if much larger makes it what may be called lumpy. I may perhaps be permitted to refer, as illustrations, to two pictures of mine at present in the Camera Club Exhibition, and to the etched plate in the *Photographic Quarterly* for October, 1890. The last-named was taken with an aperture in tinfoil, which I have not been able to measure accurately, but which is certainly not greater than  $\frac{1}{16}$  in., and a focal length of 9 inches. The river view at the Club (exhibited from a technical, rather than artistic standpoint) was taken with the same aperture and a focal length of 14 inches, and in both the definition is extremely fine. For the larger picture at the Club, "Landscape, with reeds and rushes," the focal length was 25 inches, and the aperture according to the rule above stated, viz.,  $\frac{1}{125}$  in., the definition in this case

not being by any means so great, although to my mind preferable, and for that reason I am satisfied to adopt this standard.

*View Finding.*—In the *Photographic Quarterly* I referred to several methods of determining the field of view which would be given on the sensitive plate, many of which have, however, their inconveniences and drawbacks in practical working. For instance, if the camera is swung round, and the eye applied to the pinhole aperture, it is necessary that the camera should be perfectly level; if not so, the results will not correspond. Again, many will prefer to see the view on a large scale on the ground-glass screen of the camera, instead of using a small camera-obscura. I have found it, therefore, more convenient to carry two or three common spectacle lenses, which can be got for a few pence, adapted to the focal lengths I usually employ, and stopped down if necessary to say  $\frac{f}{32}$ . They can easily be fixed into similar square fronts to that which carries the pinhole plate, and are lighter and more portable than an ordinary lens with its mount. I think, however, that if the instrument previously referred to were pierced with, say, three  $\frac{1}{2}$ -inch apertures, and behind these three spectacle lenses of 9, 16, and 25 inches were cemented and the aperture C (fig. 2) made  $\frac{1}{2}$ -in. in diameter, every required purpose of view finding would be conveniently fulfilled.

*Exposure.*—The question of exposure is undoubtedly one which individual experience will best arrive at settling satisfactorily. It may, however, be an assistance to many if I subjoin a few simple calculations as an aid to forming general conclusions, and give a table applicable, under certain conditions, to the brightest month of the year. At the same time I should wish them to be taken rather as sufficiently approximate for practical purposes than as theoretically accurate from every scientific point of view.

Supposing that an aperture of  $\frac{1}{16}$  in., with a focal length of one inch, requires an exposure of one second, what is the exposure required for an aperture of  $\frac{1}{32}$  in. with a focal length of 16 inches?

1. First find the exposure required with the same aperture ( $\frac{1}{16}$  in.) and focal length of 16 inches. The intensity of light being inversely proportionate to the square of the distance

$$1^2 : 16^2 :: 1 : 256$$

The exposure will be, therefore, 256 times as long, that is, 256 seconds.

Next as to aperture of  $\frac{1}{32}$  instead of  $\frac{1}{16}$  of an inch.

2. The amount of light transmitted being proportionate to the area of the aperture, or to the square of the diameter.

$$\frac{1}{16} : \frac{1}{32} :: 2560 \text{ secs.} : x = 23 \text{ secs.}$$

An exposure of 23 seconds would, therefore, be required under the conditions first stated above.

If an aperture one inch in diameter ( $f/25$  for a focal length of 25 inches) requires an exposure of one second at mid-day in June, sun shining, what exposure is required under the same other conditions except the aperture, which is to be  $\frac{1}{32}$  in.? Then

$$\frac{1}{25} : 1 :: 1 \text{ sec.} : x = 625 \text{ secs.} = 10 \text{ min. } 25 \text{ secs.}$$

From the above data and the usual relative proportional exposures to the strength of light, I have therefore constructed the Table (given in next column) of Exposures without lens for the month of June:—

Similar tables can easily be compiled in the same manner for other months of the year. The usual exposure tables generally allow for other conditions of light, termed sun-obscured, cloudy, very dull, gloomy and so on, but these are, to say the least of it, extremely arbitrary distinctions. The only reliable method is the actinometer, and taking ten

seconds of Stanley's actinometer as the standard, equivalent for bright sunshine at midday in June, I should double the exposure in table for 20 sec., treble for 30 sec., and

TABLE OF EXPOSURES WITHOUT LENS FOR THE MONTH OF JUNE.

Focal Length.	Aper- ture.	Morning 4 Evening 8	hours 5 hours 7	6	7	8	5, 10, 11, 12, 3, 2, 1, 12.
4 inches	$\frac{1}{16}$ inch	—	7' 30"	3' 45"	3' 00"	2' 00"	1' 30"
9 "	$\frac{1}{32}$ "	29' 24"	14' 42"	7' 21"	5' 53"	3' 40"	2' 56"
16 "	$\frac{1}{64}$ "	62' 00"	26' 15"	15' 00"	11' 15"	7' 36"	5' 40"
25 "	$\frac{1}{128}$ "	135' 25"	52' 05"	27' 20"	22' 08"	19' 45"	10' 25"

Conditions—Bright sunshine, 30 times plates. Seconds may practically be neglected, or the full minute completed.

so on. Those who do not use the actinometer may be guided by the usual instructions of exposure books, viz., sun-obscured, double; cloudy, treble; very dull, four times; and gloomy, five times the exposures of tables constructed as above. As in all other work, however, judgment must be used and allowances made. For instance, it is evident that for the very long exposures when day is waning, considerable allowance must be made. Few, however, will often commence exposure after four or five p.m. For early morning exposures, when light is waxing stronger, it will not be necessary to take this into consideration. A great point to remember is always to give sufficient exposure. As with interiors, one is not likely to err on the side of over-exposure, when long exposures are given. If exposures are to be fifteen or thirty minutes, it can scarcely make any practical difference to prolong them to twenty or forty minutes respectively. For the shorter exposures less latitude is necessarily allowable.

In concluding, I should like to correct a misapprehension which I think exists with regard to photography without a lens in the minds of those who have not seen many examples of the work produced, and who may have been guided by the hysterical outbursts of denunciation which have so frequently appeared in print. I wish to uphold that, with a pinhole, definition sufficient to satisfy any demand, pictorially considered, may be obtained; in fact that the definition may be too great, and that in some exhibited pictures it has purposely been made less intense than the method could, if it had been so desired, have produced. Pinhole-work does not, therefore, necessarily imply what has been called *fuzziness*. The real and legitimate point at issue is purely a question of taste; it is simply whether uniform diffusion is artistic. On this point I myself am perfectly satisfied, and I have not yet seen results produced by other methods of altering the definition in various planes, or of producing uniform softness, which can compare with the discarding of the lens. They may, and it is to be hoped, will come some day, for the great drawback we have to encounter is undoubtedly the necessity of prolonged exposures; not because we should consider time itself as of consequence in the production of a work of art, but because it often is the cause of limiting our choice of subject and opportunities of work.

**Guildford.**—At the last ordinary monthly meeting (Mr. A. E. Crowe in the chair), held on the 14th inst., Mr. J. Russell read a very interesting and instructive paper on "Lantern Slides." He closed his remarks by throwing on the screen a number of slides made by himself and others, pointing out the different tones attainable, what to avoid, etc.

## The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

Instructor in Photography, City of Dublin Technical Schools.

### CHAPTER IV.—(Continued.)

#### TYPICAL PHOTOGRAPHIC LENSES.

*The Orthoscopic Lens.*—This lens depends (fig. 18) for its construction upon the fact that a negative lens placed behind an achromatic lens, say the front lens of a Petzval portrait combination, will increase the extent of surface covered by the latter, and at the same time render the field much flatter than before. The negative lens consists of a biconcave flint, and a converging meniscus, also of flint, touching at the edges only.

Fig. 18.

they have been gradually replaced by other types.

*The Triplet.*—Although to a great extent supplanted by other lenses, the triplet is interesting as being the first non-distorting lens made. It consists of a pair of achromatic combinations (fig. 19) with a meniscus of small diameter and long focus placed between them. The following data enable a 10-inch focus lens of this type to be constructed:—

#### Front Lens.

Diameter, 1.714 in.

Radii of curvature	Biconvex crown	+ 3.128 in.
		+ 2.386 "
	Biconcave flint	- 2.386 "
		- 20.228 "

Fig. 19.

#### Middle Lens.

Diameter, 1.071 in.

Radii of curvature	Biconvex crown	+ 14.200 in.
		+ 4.528 "
	Biconcave flint	- 4.528 "
		- 3.200 "

#### Back Lens.

Diameter, 2.286 in.

Radii of curvature	Biconcave flint	- 30.3 in.
		- 3.557 "
	Biconvex crown	+ 3.557 "
		+ 4.728 "

Distance from front to back combination, 1.257 in.

Distance from front to middle lens, .955 in.

Indices of refraction, crown, 1.521; flint, 1.593.

*The Antiplanetic Lens.*—As made by Steinheil for portraits. This consists (fig. 20) of three lenses, the front one an achromatic combination of the usual form, the central lens a simple biconcave flint, and the back lens a simple biconvex crown. The combination works at about the same aperture as a portrait lens of the Petzval type (fig. 22), but possess a much greater depth of definition.

The following data will enable a lens of this type of 9½ in. focus to be constructed:—

#### Front Lens.

Diameter, 3 in.

Radii of curvature	Biconvex crown, thickness	+ 2.844 in.	Refractive Index.
		+ 9.488 "	
	Biconcave flint, thickness	- 9.488 "	
		- 22.063 "	1.577

#### Middle Flint Lens.

Diameter, 2 in.

Radii of curvature, - 5.551 in., - 2.437 in.

#### Back Crown Lens.

Diameter, 2½ in.

Radii of curvature, + 4.324 in., + 3.752 in.

Distance from front to middle lens, 1.051 in.

Distance from middle to back lens, .616 in.

As made by Stenheil, the series includes four lens having foci from 1¼ in. to 22 in., and covering from locket to promenade size.

Another type of lens of the same name is also (fig. 21) made by Steinheil. In this case the front combination consists of a biconvex flint cemented to a biconcave crown, and the back combination of a biconcave flint cemented to a very thick biconvex crown.

Fig. 20.

The following are the data employed in the construction of a lens of this type of 9½ in. focus, the glass being the same as that used in the portrait antiplanetic:—

#### Front Lens.

Radii of curvature	Biconvex flint, thickness .193 in.	+ 2.519 in.
		+ 11.299 "
	Biconcave crown, thickness .161 in.	- 11.299 "
		- 3.874 "

#### Back Lens.

Radii of curvature	Biconcave flint, thickness .134 in.	- 3.874 in.
		- 1.355 "
	Biconvex crown, thickness .967 in.	+ 1.355 "
		+ 2.835 "

*The Petzval Portrait Lens.*—This consists (fig. 22) of a cemented achromatic plano-convex or concavo-convex lens forming the front combination used in conjunction with a diverging flint meniscus at a slight distance in front of a biconvex crown.

Fig. 21.

The front combination gives an image free from spherical and chromatic aberration along the axis, but of limited area, as the marginal rays are practically uncorrected. The back lenses lengthen the focal distance and reduce astigmatism to a minimum, whilst the diverging meniscus, forming portion of the back combination, renders the field very flat. To equalise the illumination, the front lens is of slightly smaller diameter than the back one.

Such a lens may be employed full aperture, but the circle of definition does not, under such circumstances, exceed one quarter the focal length of the lens.

By stopping down to  $f/10$  the circle increases to half the focal length, and by reducing the aperture to  $f/25$ , it becomes equal to the focal length.

The following data will enable a half-plate lens of this type to be constructed.

## Front Lens.

Diameter, 2.5 in.			Index of re- fraction.
Radii of curva- ture	Biconvex crown	{ + 5.566 in. }	1.524
		{ + 4.755 " }	
	Biconcave flint	{ - 4.755 " }	1.603
		{ - 6.255 " }	

## Back Lens.

Diameter, 2.75 in.			Index of re- fraction.
Radii of curva- ture	Diverging meniscus	{ + 9.1 in.	1.574
	of light flint	{ - 3.8 "	
	Biconvex crown	{ + 16.333 "	1.524
		{ + 5.000 "	

Distance between lenses of back combination, .065 in.

Distance between front and back combinations, 4 in.

Dallmeyer's lenses of the Petzval type include two series: an extra rapid one including four lenses, viz., 2 C and 3 C for cartes, and a miniature and medallion lens for portraits of smaller dimensions, and a series of ordinary rapidity, including three lenses, 1 B, 2 B, and 3 B for cartes only.

The following are the data employed in constructing one of these lenses expressed as

Fig. 22.

ratio of the focal length of the combination taken as 10:

Focal length of combination, 10.

## Front Lens.

Diameter, 2.977 in.		
Radii of curvature	Biconvex crown	$\left\{ \begin{array}{l} + 5.585 \text{ in.} \\ + 4.755 \text{ " } \end{array} \right\}$
	Biconcave flint	$\left\{ \begin{array}{l} - 3.701 \text{ " } \\ - 102.662 \text{ " } \end{array} \right\}$

## Back Lens.

Diameter, 3.517 in.		
Radii of curvature	Diverging meniscus of flint	$\left\{ \begin{array}{l} + 13.030 \\ - 5.844 \end{array} \right\}$
	Biconvex crown	$\left\{ \begin{array}{l} + 10.195 \\ + 10.195 \end{array} \right\}$

Distance between lenses of back combination, .037.

Distance between front and back combination, 2.424.

Voigtlander adopts different data in the construction of these lenses, which are subjoined for comparison:

Focal length of combination, 10.

## Front Lens.

Diameter, 3.000 in.			Index of R. fraction.		
Radii of curva- ture	{	Biconvex crown	{ + 5.454	1.536	
			{ + 4.318		
		{	Biconcave flint	{ - 4.318	1.602
				{ - 54.545	

## Back Lens.

Diameter, 3.250 in.			Index of re- fraction.		
Radii of curva- ture	{	Diverging flint meniscus	{ + 10.909	1.602	
			{ - 3.833		
		{	Biconvex crown	{ + 4.742	1.536
				{ + 16.366	

Dallmeyer also constructs lenses of this type in which means is afforded of varying the depth of definition at will. The front lens in this case (fig. 23) is practically the same as before, but the back combination is made up of a converging crown meniscus, associated with a diverging flint meniscus, the distance between these latter lens being capable of alteration to suit the depth of definition required.

Fig. 23.

Three series of these lenses are made by Dallmeyer, viz., A, B, and D. Of these the B

lenses are for cartes and cabinets, the A lenses for portraits up to  $20 \times 16$  inches, and the D lens for portraits and views. The B series includes the most rapid, and the D series the least rapid lenses, the A lenses occupying an intermediate position.

## Thursday Evenings at the Camera Club.

(BY ONE OF OUR STAFF.)

DR. C. S. PATTERSON presided at the meeting on the 16th inst., when there was a good attendance of members to hear Mr. J. Howson deliver himself on "Conventionalism in Colour." Previous to the reading of the paper, however, the Hon. Sec. handed round some early prints, sent by Messrs. Marion and Co., from the flash-light negatives taken the previous week; also one of Manson's focussing cloths, which are made in convenient form for covering the whole of the camera. Dr. Patterson showed a Bain's mask-cutter.

Mr. Howson spoke at some length, and in the course of his remarks he said that years ago photographers were confined to the warm colours of untuned silver prints, and the crudeness and sameness of these led workers to seek a means of subduing and altering them, and gold toning resulted. Following this came the period of the toned purple print, and then the cold grey or black tones of the platinum prints reigned supreme. That any one method or colour is the one and only means to be used in reproducing our pictures, any thoughtful mind would readily deny. Surely we had within our grasp, out of the several methods possible, a varied media for indicating or harmonising with the landscape we desire to portray. Why should we not use them? Why should not the beauty of each 'scape, whether of sea or land, not be portrayed in a print which was to some extent in harmony with the subject, or the special aspect under which that subject was seen. Why should it be conventional and necessary to depict a glorious sunrise, a broad, bright noonday scene of purple moorland, the sparkling ripple of a summer sea, and the fading dusk of a sunless eve, alike in the one dull monotony of funeral black, in cold purple, or in any single shade of red or brown. Apart from fashion, which may be considered as utterly unreliable, there were only individual taste and the adaptability to subject to fall back on, and these are the two points he urged. Whilst silver printing, as such, was defended, it could not but be confessed that, with albumen as a vehicle, it deserved many of the hard things said of it. The advantages offered by Alpha and gelatino-chloride papers were, first of all, permanency, which was fairly well established, and possibility, of colour and surface. We had, in surface, choice of ordinary matt or enamelled, by simple means which it was unnecessary to name. It might be well to point out the partial fallacy of another fashionable dictum. That highly-glazed surfaces were inartistic was surely a matter of debate. We admired, with good reason, the enamel miniatures of a past age, and there should be no less to admire in an enamelled picture of some subjects. If the gloss was the sole or primary attribute of the picture, it might be condemned; but if only secondary, and the picture was good in itself, then there could

not be any valid objection made to it. There could be no universal rule either of praise or blame. Thus much for surface. In colour we had a much wider scope. In conclusion, he contended that the photographer should endeavour to find the salient tint in a landscape, and then try to reproduce it in his print, the result of which would be that the print would convey a more correct idea of the scene. Mr. H. Hinton was all on the other side, and would not admit that there was any such thing as conventionalism in colour, holding that all colours had been used, from warm browns to greys and blacks.

Mr. Davison agreed with the reader that they should pay more attention to varying the monochrome tint of their pictures according to the subject; but then, as would probably strike anyone considering the subject, he pointed out that it was a difficult matter to decide what was the salient tint of a view. Platinum had taken a great hold, but that was not because of the grey or black tone, but because of the matt surface, and there had been as much of the warm-colour platinum worked as of the cold. There were certain surfaces which for artistic purposes they must decide never to use; that was the surface of the high detail-giving papers (gelatino-chloride), which were, however, admirable for scientific work, but they gave heavier shadows than platinum, and that was against them. There was, too, an absolute objection to the glazed surface, which gave disturbing reflections. It was true that platinum prints were put under glass, but that was compulsory; the prints looked far better without it. Mr. Gale expressed the opinion that these points were all matters of fashion. Thirty years ago they used rough paper; then came albumen paper, and now they were going back to rough surfaces. Mr. Bright said a word in defence of bromide, which he said was simple and extremely convenient, and suited some subjects better than any other process.

The proceedings terminated with a vote of thanks to the reader.

On Monday, the 13th, there was a special lantern evening at the Club, and one of the largest and most interesting collections of slides ever shown at the Club was brought together by members and friends.

The extra meeting was appointed for the purpose of working off the arrears into which the lantern exhibition had fallen owing to the period of removal into the new premises. Over 400 slides were shown (almost all new at the Club), the work of Messrs. Gibbons, Jones, Elder, d'Arcis, Noel-Cox, Carpenter, Bennet, Lawford, Laurie, Maskell, Mathews, Bright, Hughes, H. M. Hastings, Andreæ, Huskisson, Burton, Cembrano, Seyd, Chang, and Fitz-Payne.

On Thursday, April 30th, Mr. J. Traill Taylor will read a paper on "Lantern Optics."

## Reviews.

*Die Orthoskiagraphische Photographie, Bemerkungen über Misserfolge und deren Abhilfe und Sammlung von Rezepten.* By Ludwig David and Charles Scolik. Published by Wilhelm Knapp, Halle-a-S. Price 6s.

The above work forms vol. ii. of David and Scolik's work on Photography with Gelatino-bromide of Silver, and, under the new and certainly not euphonious term "orthoskiagraphic," treats of colour-sensitive or orthochromatic photography. A brief historical introduction, a consideration of the most suitable emulsion, the chemical properties and composition of the dyes used, introduce us into the practical portion of the work, and plain and practical directions are given for the preparation of colour-sensitive plates.

The authors include the results of their own experience and that of the leading authorities, and finally come to the conclusion that ready-prepared plates bathed in an ammoniacal solution of the dye are more sensitive generally and more sensitive to colour than plates dyed in the emulsion making, the only disadvantage being that they have not quite such great keeping powers. A good resumé of the use of the yellow screen follows, and we have here two collotypes of a landscape, one taken with an ordinary plate, the other with a colour-sensitive plate with a yellow screen. In our opinion, although the difference is most marked, a much more pleasing result would have been obtained had the yellow screen been omitted, as it has acted in such a manner as to destroy to a great extent the effect of distance. Practical hints upon the

application of colour-sensitive plates to every-day work follow, and a coloured chart is given with collotypes from ordinary and orthoskiagraphic plates, and also one showing the use of the screen. We have personally tried this chart, and find that for comparative work it is almost valueless, as the colours are by no means intense enough to prevent the action of the white paper. There is also one important point to be remembered in orthochromatic photography, and that is that the behaviour of, or sensitiveness of, a plate to pigments is of little, if any, value for estimating the sensitiveness of that plate to solar light as reflected from natural objects. A coloured chart of the solar spectrum, and collotypes of some of Schumann's results when working with colour-sensitive plates in the spectroscope, are also given. The latter part of the book is not the least valuable. Failures and their remedies are well and practically treated, and the collection of receipts is good, and does not contain too many old "chestnuts." The authors have done their work well, and have succeeded in giving us a practical handbook without loading it with theory. A very good photogravure of the Archduchess of Austria is also given as a frontispiece.

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

FRIDAY was graduation day in Edinburgh University, when a large number of young gentlemen received their M.A. and other degrees, the ceremony in connection with which consists of their being capped with a rather peculiar looking piece of tailoring, which is reported to have been made out of the knee breeches of George Buchanan, the popular Scottish courtier and wit. The graduates appear in robes, and the ceremony over, there is a rush to the studios to have themselves photographed in them before the hired garments require to be returned. Quite a battalion of them might have been seen wending their way across the meadows to North Bruntsfield Place, where Mr. Alex. Ayton's studio is situated. Mr. Ayton is very popular among the students, being, on account of his excellent grouping talent, almost universally employed to photograph them in classes during the session. On Friday afternoon he had several hours' hard work with the camera, upon the graduates, whom he found to be most agreeable sitters.

The ladies have no status in Edinburgh University as yet, but they are hopeful that in the near future they will be permitted to take degrees within its walls. In the meantime, and for the past twenty-four years, they have conducted on their own account a school in which a university education is given to women. Their "graduation" day was also Friday, and at it Professor Copeland, Astronomer Royal for Scotland, in illustration of the value of the higher education of women, stated that at present a series of Photographs of the heavens are being taken in Peru, and that these are forwarded to Cambridge, U.S., where a staff of women, working under the direction of Miss Fleming, pass them under the microscope, and arrange and classify the stars and other bodies. The work is excellently done, and the results are published, month by month, in strictly scientific astronomical publications. Curiously enough, astronomers in the United Kingdom usually get their first sight of these publications in German journals.

The law as to the liability of railway companies for breakages in transit was exemplified by an action which was before the Edinburgh Sheriff Small Debt Court on Wednesday 15th inst. The pursuers, Messrs. M. and J. Scott, photographic artists, 36, George Street, Edinburgh, sued the Caledonian Railway Company for £4 19s. 6d., the value of a picture frame which, they said, was seriously damaged while being conveyed by the railway company from Aberdeen to Edinburgh in December last. Liability having been denied by the defenders, evidence was led, from which it appeared that the case containing the frame was regarded as an "empty," and that when it was delivered to the pursuers, they signed for it as in good order, but that four days later it was opened, and that then the damaged frame was discovered within it. Sheriff Rutherford said that the fact of the pursuers having accepted the case as in good order did not preclude them from raising the present action. On the ground that the pursuers had proved that the frame was not damaged after it came into their hands, while the defenders had not proved that the damage was not done in transit, he gave decree for the sum sued for with expenses.

It is with pleasure that I take notice of the progress of flash-light photography in this district. The Leith Town Council, feeling their council chamber to be too small for the increasing business of the borough, have resolved upon a scheme for the enlargement of it. Their last meeting in the old chamber was held recently, and when the business was concluded, the room was cleared of all save the Magistrates and Council, who kept their seats while Mr. John M'Kean, the well-known successful photographer of Ferry Road, Leith, took a flash-light shot at them. An excellent print has been obtained of the Board, and Mr. M'Kean has, with his usual generosity, at the request of the local press, handed it over to them for reproduction. Mr. M'Kean has every reason to be satisfied with his work on this occasion, and it is to be hoped that other public bodies will avail themselves of the opportunity now afforded them of perpetuating, by means of the flash-light, interesting scenes in their history as they occur from time to time. I look upon it that the time is not far distant when every important dinner party or ball will be so photographed.

## Notes from the Liverpool Centre.

(By our District Editor.)

EARLY last Monday Mr. Paul Lange left Liverpool to open the *conversazione* which inaugurated the first show of the Gloucester Exhibition. Mr. Lange also gave "Iceland" on Monday night, a lecture which has considerably added to this gentleman's already enviable reputation. The house was delighted with the pictures and the accompanying lively descriptive matter.

Our late Exhibition and Exhibition matters being pretty well out of the way, the local societies, particularly the premier associations of Liverpool and Birkenhead, are settling down to close and serious work again. Excellent accounts come from nearly all our camera men's clubs. Last summer most of the executives organised a series of day and half-day picnics, and this year similar enjoyable jaunts on a more extensive scale are to be promoted. Evidently these combinations of business and pleasure are very popular. Those organised by the Liverpool Amateur Photographic Association, at least, are very largely attended even when frequently held.

The latest photographic society in Liverpool, the Liverpool Camera Club, is, I hear, progressing rapidly. There is marked energy and meaning in the proceedings of the Society, and a breeziness which betokens plenty of healthy life.

Thursday night next is fixed for the ordinary monthly meeting of the Liverpool Association, when a large attendance and a substantial increase in the membership roll is anticipated—the latter as a result of the exhibition. At the meeting, a complete report of the big show will be read, one which I understand will prove very gratifying to all concerned. I looked up several gentlemen of the executive a day or two ago, and found each in high spirits over their superb successes. The remarks of the photographic journalists from London who spoke at the opening proceedings of the show were to the effect that in every respect the arrangements for the function were in an unusually forward state. This same energetic action on the part of the enthusiasts was noticeable in the dismantling of the Exhibition. On the last night the show closed at 10.30; the next day was Sunday, and, of course, nothing was done in the way of taking down. By the following Wednesday night, however, all the pictures, exhibits, etc., had been packed up and removed, the decorations consigned to limbo, the galleries swept out, and desolation reigned supreme. Those who visited the Exhibition will admit that this was a "tall" three days' work.

Before this issue of the AMATEUR PHOTOGRAPHER is in the hands of readers the medals won in the show will have been received by the winners. They were distributed at the ladies' social conversation and dance given as a wind-up on Tuesday last week, and were immediately despatched to the rightful owners. *Apropos* of the medals, I have received a letter from a correspondent, who says, "I won a silver medal in the late exhibition at Liverpool, and it was handed to me with something to this effect: 'We are sorry you did not get a gold one.' I take this as a very kindly compliment, but am more than pleased with my silver award. Having spent three days in the exhibition, and having gone carefully through the exhibits, I would say, in answer to the compliment paid me, that the lady and the three gentlemen who secured the four gold medals unquestionably

deserved them." This expression of opinion should be very gratifying to the gentlemen who adjudicated and to the exhibition authorities as well. There can be no question that, with one or two exceptions, and these not very serious ones, the placing of the over thirty medals was exceedingly satisfactory. If any competitors really had grounds for dissatisfaction, such might be found in Liverpool itself.

By the way, it must be stated that the final festivities in connection with the closing of the Exhibition were a pronounced success. The "flash-light" could have been introduced with effect.

As a result of the enormous interest manifested in the Exhibition by the general public, I hear that there is a strong probability of a prominent Liverpool amateur contributing a series of photographic articles to a local newspaper.

In regard to the sensational breach of promise case just closed, it is the talk here that a detective camera, judiciously handled, might have been made to play an important part in the trial. Ladies of "Sassietty" would do well in future to snap-shot any and every one of their admirers in the act of proposing. A photograph artfully placed in position on a convenient sideboard would also be of material value. Gentlemen would then be photographed and phonographed into keeping their pledges.

## Apparatus.

### THE PARALLEL TRIMMER.

MR. W. R. BAKER, of Wallington, has left a specimen of this very ingenious piece of apparatus with us, and we shall be pleased

to show it to any amateur calling at the office. The trimmer is made in several sizes, the smallest being whole-plate, which will, however, trim all sizes below it. It will also answer admirably for cutting mounts and masks for transparencies, and can even be used for cutting plates. We give the directions for use issued with the trimmer:—Slip the print under the cutting guide A, and T square B, until only so much projects as is intended to be cut off. Now push the T square along until it is near some vertical line, moving the print, if necessary, so as to make this line parallel with it, and whilst pressing the guide firmly down with the left hand, pass the knife or cutting wheel along its outer edge. The trimmed side is then placed accurately against the raised edge of the rule and the knife used as before. Although the T square is only used in cutting the first side it is best left on the board, and the print moved about beneath it, as its weight keeps the print from slipping when placed in position against the rule. If there are no vertical lines, lay the arm of the T square across the centre of the picture, and it will be easily seen at what angle to cut the bottom. Should a water horizon be shown, the top and bottom must be trimmed parallel with it.

The price of the whole-plate trimmer is 8s., and of the 12 by 10, 10s. 6d. Mr. Baker also showed us a walking-stick stand, which is fairly light, easily set up, rigid

enough for a hand-camera or quarter-plate, and consists of only two pieces, exclusive of the head.

### WOOD'S IMPROVED WASHER.

This washer, which was on view at the recent Liverpool Exhibition, is one of the best of those with which we are acquainted. The slight alterations made in the recent ones render them

more effective than the old form. Mr. Wood is an analytical chemist, and he gives his word that the washer will eliminate every trace of hypo from plates in fifteen minutes and from prints in thirty minutes. Besides this, the prints are always on the move, and there is an automatic arrangement by which, if the supply of water be suddenly cut off, neither plates nor prints can be left dry. The rack supplied for using with plates is adjustable for all sizes of plates, and the long

handles attached to it will be found useful for hanging the plates up to dry. Mr. Wood says he has sold enough washers to make a pile nearly four times the height of St. Paul's. The price of an 8½ by 6½ washer is 12s. 6d.; and of an 8½ by 6½ rack, adjustable for nine sizes, 4s. 6d.

## Quarterly Examinations in Photography.

**Question 4.**—What is the optical centre of a lens, and how would you determine the position of the same?

**ANSWER.**—The optical centre of a lens is that point in the axis of a lens through which the lines which join any points in an object and their image meet. Strictly speaking, a double lens has not got an optical centre, but the point can be found which may be called an optical centre, as follows: Place in front of the camera a post at, say, 50 ft., at B, and another at right angles, at, say, 10 ft., at D. Focus the first accurately on the middle of the ground-glass.

Measure accurately AC and EC, the distance from the ground-glass to the starting-point, and the length of the space on the ground-glass between the images of the two rods. We now have the materials for finding out what we want.

AB = 50 ft.  
BD = 10 ft.  
AC = 5 in.  
EC = 1 in.  
BC = 50 ft. 5 in.

Now,  $BD + CE \therefore CB :: CE \therefore CF$   
 $10 \text{ ft.} + 1 \text{ in.} \therefore 50 \text{ ft. 5 in.} :: 1 \text{ in.} \therefore CF$

The optical centre being in F.

$1 \times 605 \div 121 = 5 \text{ in.}$ ; the optical centre is 5 in. from C, the centre of the ground-glass, along the axis of the lens, which can easily be marked on the brass mount. Generally, the stop is inserted in the optical centre.

R. C. M.

**Question 5.**—Write a brief note on pinhole photography; and how would you determine the diameter of the hole for a given plate and distance?

**ANSWER.**—For pinhole photography I have used my ordinary camera, substituting for the front which carries the lens a bit of cardboard, blackened at the back, pricked with a needle. I believe it is better to use a heated needle. I fancy, from the few experiments I have made, the width of angle included is the same at any given distance of the plate from the aperture as would be included by a lens of the same focal length. I found at 7 in. and at 4 in. that the size of the image was the same as was given by lenses of these focal lengths respectively.

I have no means of measuring the aperture, and to obtain good results the size of the aperture is very important, and varies with each distance. When  $d$  is the diameter of the aperture, and  $F$  the distance,  $\frac{d^2}{F} = 0.00081$ . An article on this subject will be found in the *British Journal* for June 1st, 1888.

I have not succeeded in getting at all sharp negatives, and I believe it is impossible to get them equal to negatives taken with a good lens, but I attribute part of my failure to my not having hit on the right relation of aperture to distance.

I gave at 4 in. an exposure of 30 sec. on an England's ordinary plate. At  $f/45$  I give with a lens about 2 sec., which leads me to think my aperture was too big. The formula given above will always give the right size.

R. C. M.

**Question 6.**—Forward a print from a cloud negative, and state (a) the position of the sun with regard to the camera, (b) time of day, (c) method of obtaining negative.

**ANSWER.**—The sun was about 45 deg. to the right of the direction in which the camera was looking; time of day, 11 a.m. in March.

Plate, England's ordinary celluloid film. A yellow screen was used. Stop,  $f/16$ .

A slow instantaneous exposure with Guerry double-flap shutter, I fancy, from a quarter to half a second.

Developer:—

Pyro	...	...	...	...	...	...	3 gr.
Bromide	...	...	...	...	...	...	1 "
Ammonia	...	...	...	...	...	...	2 "

The bromide and ammonia were added by degrees, beginning with a quarter of the quantity.

You ask for no information about print, but I may mention it is on Eastman's bromide paper, developed with ferrous oxalate.

R. C. M.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Brighton.**—At the ordinary fortnightly meeting of this Society, held on the 14th inst., Mr. J. Howson delivered a lecture on the advantages to be derived from the use of the "Alpha" paper in photographic work. Practical demonstrations were carried out before the audience of the manner in which to proceed in order to get different shades of colour, etc. The lecture was followed by an exhibition in the developing of "special" lantern slides, the object of which was to show that in the particular process followed, no distinctive difference was shown at the finish between the plate subjected to ten seconds' exposure and that subjected to an exposure of a much longer period.

**Cornish.**—A meeting was held on the 14th inst. Enlargements were on view which had been lent by the Editor of the AMATEUR PHOTOGRAPHER. After inspecting the pictures, Mr. H. Tonkin, Hon. Sec., gave a demonstration of "Enlarging," two negatives being exposed by artificial light on bromide paper and developed by the oxalate developer, the resulting pictures being admired by all present.

**Croydon Micro.**—An ordinary meeting was held on the 17th inst. Mr. Edward Lovett (in the chair), when an exhibition of hand-cameras took place, amongst the exhibitors being Messrs. Adams and Co., Ideal and Adams'; Mr. Cusworth, Repeater; Messrs. Griffin and Sons, Dines; Houghton and Sons, New Patent Hand-Camera; Messrs. Humphries, Quadrant; Mr. Hurst, Hurst's; Messrs. Marion and Co., Radial; Messrs. Parker and Son, Companion; Platinotype Company, Key; Messrs. Robinson and Son, Luzo; Messrs. Ross and Co., Portable Divided and New Patent; Messrs. Mawson and Swan, Reflex. The next ordinary meeting will be on May 1st, when Mr. D. E. Goddard will read a paper entitled "Elementary Silver Printing." Saturday, April 25th, half-day excursion to Oxted, for Godstone; leader, Mr. W. Low Sarjeant.

**Devon and Cornwall.**—"The Essentials of a Photographic Camera" was the subject of a lecture delivered on the 13th inst. at the Athenæum, Plymouth, by Mr. W. G. Tweedy to the members of

their society. Mr. Tweedy considered that in choosing a camera a purchaser, to ensure success, should be careful that it was strong, light, of small bulk, easily put together and taken down. He instanced cases in which great inconvenience had been occasioned through complicated arrangements. Furthermore, the camera should be so constructed as to be damp-proof to the slight showers that often overtake a photographer in the course of his rambles. He deprecated a camera having a number of loose parts, as they were apt to get lost or mislaid. Mr. Tweedy exhibited various kinds of cameras, many of which he had himself improved, and stated that he was going to bring before the public a new and improved hand-camera in the course of a few days.

**Ealing.**—This Society held their last meeting for the winter season on Thursday, the 16th, at 8 o'clock, in the Public Buildings. The room was well filled with members and their friends; and the many ladies present evinced the interest taken by them in photography. Two gentlemen were proposed for membership, and Mr. W. B. Wright and Dr. Clifford Gibbons were appointed auditors for the year. Ten names were given in of intending competitors for the prizes offered by the President for lantern slides, to be made from negatives to be supplied to the competitors. The evening was devoted to the exhibition of lantern slides. Slides were contributed by Messrs. Mawson and Swan, Mr. Whiting, Mr. F. H. Williams (Hon. Sec.), Miss Williams, Mrs. McDonald, T. Crisp, jun., V. H. Sanders, and Dr. Clifford Gibbons.

**Holborn.**—Mr. T. O. Dear presided at the usual weekly meeting of this Club on the 17th inst., when Mr. Fred. Brocas gave an instructive lecture on "General Hints to Beginners," dealing with the numerous stumbling-blocks which seem to enter into a compact to frighten a beginner into throwing photography over. He specially mentioned the matter of the foreground. Not only beginners, but those who were fairly proficient in photography, have negatives in which about one-third of the plate consists of an uninteresting foreground. Under-exposure was also dealt with at great length. Most beginners, he said, always under-expose. It was much better to over-expose, because by judicious development a fair negative may be obtained from an over-exposed plate, but an under-exposed one would never give a good negative. In the discussion which followed, halation formed the chief topic, it being the general opinion of the members that, although a troublesome job, backing the plate was certainly an advantage.

**Harlesden.**—An entertainment was given at the Court-house on the 13th inst. by the members of the Harlesden and Willesden Photographic Society. Every inch of space was occupied when the ball was set rolling by Mr. Winterbon's well-executed pianoforte solo—"Sketches from a Portfolio." Then the room was darkened, and Mr. J. Naylor commenced his "Lantern Exhibition," entitled "A Holiday Trip with a Camera." By the aid of a limelight lantern, photographs taken with the camera were cast upon the curtain, while Mr. Naylor accompanied them with a few words of explanation, from Chester proceeding to North Wales, on into Yorkshire, and thence into the South of England. Applause greeted every picture, and indeed it was deserved, for as specimens of photography they were marvellous. So vivid were some of the illustrations that one seemed to be actually standing within a few feet of the spot, again you could discern every leaf on a tree, and cattle appeared to be within touch. The exhibition was concluded with a few miscellaneous slides. As a pleasant little break, a few songs followed. A second lantern exhibition was then given by Mr. T. Clapton, who dealt exclusively with "Walks near Home." Starting with a map of Willesden and neighbourhood, Mr. Clapton produced pictures well-known to most of the audience. Kingsbury, the Brent, Twyford Bridge, Twyford Abbey, Forty Lane, Willesden Church, The Old Crown, were all subjects of which a great deal had been made. This was another display of first-class work, and it was greatly appreciated. Not the least part of Mr. Clapton's exhibition, however, were his many quaint and humorous remarks. A life-like representation of Mr. Cohen, the Secretary, was the last slide thrown on the curtain, and we may add that this gentleman announced during the evening that the society were thinking of starting classes, and he appealed for additional members, asking people not to wait till they got their outfit, but to come and join at once so as to avail themselves of the society's advice.

**Ilkeston.**—On the 16th inst. the members of this Society gave their second lantern exhibition in the Town Hall, Ilkeston, before a large audience. Dr. Carroll (President of the Society) took the chair, Mr. G. W. Woolliscroft (Treasurer) exhibited the slides through his lantern, and Mr. W. Shakespeare (Hon. Secretary) officiated as "guide, philosopher, and friend," in the shape of supplying the necessary description.

**Jersey.**—The annual meeting of this Society was held on the 1st inst., when the accounts were audited and passed and the annual report read. The following officers were elected for the ensuing year:—President, Capt. Lamb; Vice-President, Col. Jackson; Secretary, Dr. Taylor; Treasurer, Mr. Gruchy. Committee: Mrs. Haddon Smith, Mr. Messervy, Mr. Andrews, and Mr. Toms. Mr. Hammond

Spencer, C.E., was proposed and elected as a member. It was proposed and carried that the best prize of the year, a gold medal, be given for the best excursion record, also that a photographic survey of Jersey be commenced. The certificate for best picture for March excursion was awarded to Capt. Lamb for a ploughing scene. On the 7th inst. there was a well-attended excursion to Mont Orgueil Castle, Gorey. On the 15th the excursion pictures were voted for, the honours falling to Col. Jackson, who secured thirteen out of twenty-four votes; seven for an excellent platinotype of Gorey Castle and village, with group of bluejackets drawing water-cart in foreground, and six votes for a similar picture with bluejackets in the middle distance. Mr. Toms then gave a brief outline of the chief platinotype processes, and showed practically the mode of coating the paper and developing the print. Dr. Taylor having expressed his inability to continue his duties as Secretary, a cordial vote of thanks was accorded to him for his labours in the past. All communications in future should be addressed to F. Woodland Toms, F.I.C., F.C.S., 21, Grove Place, Jersey. The next meeting will be on May 6th, when Capt. Lamb will give paper and lantern show on "Through Europe with a Hand-camera."

**Lewisham.**—The largest ordinary meeting of the club was held on the 17th inst., when eighty members were present. Mr. A. R. Dresser gave a lantern-slide demonstration, it being specially interesting in consequence of his criticisms of the slides sent in to a recent competition, most of which he said would have been greatly improved by the addition of clouds. He first showed how to print in suitable clouds, and to vignette any parts that were too dense. He then exposed the plates 10, 30 and 80 seconds, respectively, to show what great latitude there was, if suitably developed. He used hydroquinone, and advised the use of the carbonates in connection with it, as he said the caustics gave very granular results if development was at all prolonged. After the demonstration, he put through the lantern some of his prize slides, and drew the members' attention to the fact that wherever necessary clouds had been added; in fact, in the majority the clouds formed the principal feature. He also showed a few slides of his celebrated dog, which were greatly admired, and a very hearty vote of thanks was given him for one of the most successful evenings the club has had. The next meeting on May 8th, "Cycling and Photography."

**Manchester.**—At the monthly meeting of the amateur photographic society held on the 14th inst., the Rev. H. J. Palmer in the chair, Mr. W. Lamond Howie, F.C.S., Eccles, described and illustrated by 120 photographs shown by the lime-light lantern a visit paid to Ober-Ammergau last summer. The lecturer first dealt with mediæval German art as seen in the architecture of Cologne, Strasburg, Nuremberg, Munich, etc., and in bronze, woodwork, and paintings, which he had photographed in the museums and churches. In passing from this portion of his subject he made some strictures on the comparatively meagre patronage bestowed on art by the English nobility, who—to quote M. Gally—seem to prefer to spend their money on horses and dogs. Many beautiful slides were exhibited of the Bavarian Tyrol, and afterwards a well-selected series of scenes from the Passion Play. The lecture concluded with views of the earth pyramids which exist in ravines on the Ritten, in the Austrian Tyrol, several being exhibited like church spires with stones many tons in weight perched on the apex, which showed in a striking manner the effects of denudation. The lecturer was frequently applauded.

**Richmond.**—On the 17th inst. a well attended meeting was held, Mr. Jeffrey in the chair, the subject for discussion being "Intensifying, Reducing, and Retouching." Two pieces of home-made apparatus were shown; a frame or box for contact printing, either of paper or transparencies, by Mr. Faulkner, and a shutter by Mr. Richardson, both being of ingenious design and excellent workmanship. The discussion which followed was well sustained and productive of many practical hints.

**Stockton.**—On the 9th inst. the first excursion of the season took place to Saltburn-by-the-Sea, but owing to unfavourable weather very few members turned up. The visitors were afterwards entertained to tea by the President of the Society, Dr. Stainthorpe. The usual monthly meeting was held on the 14th, Dr. Stainthorpe presiding, who also obtained the highest number of marks in the monthly competition, the subject being "A General Landscape." Samples of the Barnet plate, kindly sent by Messrs. Elliott and Son, were distributed amongst the members. On the 27th inst. there is to be a public lantern show.

**Toynbee.**—The annual general meeting was held on the 14th inst. After the report had been read and the usual business transacted, Mr. J. Seed, of the Harlesden Photographic Society, gave his very interesting and instructive lecture on the "Elementary Rules of Art Applied to Photography," and with the help of a number of lantern slides, copies of standard engravings, showed what photographers should endeavour to secure in their pictures. The lecture concluded with a large number of beautiful lantern-slides, photographs by the President of his Society, Mr. J. Naylor, clearly showing that artistic photography is possible. Thursday, 16th, lantern evening

## Crystal Palace Exhibition.

THE show of apparatus at the Palace this year is small, but we must say that what is shown is of good quality and workmanship, and well worthy of the attention which it excited. It is to be regretted, however, that so few of the larger apparatus makers were represented—from the point of view of the public, and not of those who had stands.

### Block A.

W. WATSON AND SONS, 313, High Holborn, occupy the whole of this block with a very imposing show, the great feature of which is their celebrated "Acme" camera, of which we give two illustrations. It is well made, with interchangeable parts and all the necessary movements, and if desired fitted in aluminium. They also show a couple of fine studio cameras on stands; the "Vanek" hand-camera, the great peculiarity of which is that it enables the user to focus on the finder. There are also a number of condensers,

of which are very striking and attractive. The process, which is a novel one, is being patented, and we hope very shortly to give an article describing it fully.

### Block C.

DAVID NOAKES AND SON, Nelson Street, Greenwich, show some fine enlarging apparatus, and some excellently finished biunial and triunial lanterns; condensers from  $3\frac{1}{2}$  to 12 in. in diameter; the Key hand-camera, a good selection of lenses, the "Invicta" series of cameras. They also had on view the new patent regulator tap for gas cylinders, a great aid to safety in working. Several lathes are working at the stands, and lantern and photographic apparatus is seen in course of manufacture.

### Block D.

Messrs. TAYLOR, TAYLOR, AND HOBSON, Slate Street Works, Leicester, have on show samples of all their lenses, including the celebrated Caskets. They also show an  $8\frac{1}{2}$  by  $6\frac{1}{2}$  Blair Compact camera, Blair tripods in mahogany and ash, finders of various kinds, and the "Hawk's-eye" hand-camera. For a further description of

Messrs. Taylor's lenses we refer our readers to the article in the AMATEUR PHOTOGRAPHER of March 27th last. We give illustrations of the Detective camera lens, and Concave finder.

PARKER AND Co., 288, High Holborn, W.C., devote their space

principally to the exhibition of the "Companion" Hand Camera, which we fully noticed in a recent issue. Since our notice, however (April 10th), a new shutter had been attached to the camera, consisting of two metal shields, each perforated with an aperture the same size as the lens, which pass across each other, and are worked by a lever, giving great latitude

in the time of exposure. A Taylor finder has also been added. There is also the "Companion" Tourist's Camera, which has a long extension, and is fitted with a rising front, which is fixed at any point automatically without the use of screws.

S. T. MATTHEWS AND Co., 8A, John Bright Street, Birmingham, devote most of their space to the exhibition of the "Itakit," "Sovereign," and "Kinematic" Hand Cameras. The "Itakit," which costs 12s. 6d., is a most ingenious

little instrument. It is made of metal, carries twenty-four plates  $3\frac{1}{4}$  by  $3\frac{1}{4}$ , and is fitted with a rapid achromatic fixed-focus lens. The "Sovereign" is a little better instrument, and is fitted with a finder and focussing screen the full size of the plate. Extra magazines to hold other twenty-four plates are supplied at 3s. 6d. each. The magazine shown on top of the "Itakit" can be placed inside the lower part for convenience of

carriage, and the whole, if desired, enclosed in a leather case. The specimen prints on the stall were all that could be desired.

JUSTIN BROS., 116, Beckenham Road, Penge, S.E., show the "Pocket Walking-stick" and Camera Stand. Each leg of the stand is made of a strong steel ribbon, wound spirally, and each will shut up into a case not much bigger than a thimble.

W. F. SLATER, 169, Southampton Street, Camberwell, S.E., shows some well made long-focus cameras, with all necessary

movements, light, and of reasonable price, a half-plate costing £1 3s., and a 15 by 10 £10 5s. He shows also an attractive little quarter-plate set which he sells at £1 11s. 6d., fitted with lens, tripod, etc. There are light

xylonite trays of various sizes and colours, and a fine lamp which he has just put upon the market. It throws practically no shadow, has one side orange glass and the other red, and can be

turned in any direction by a touch of the finger, without affecting its stability. Mr. Slater also has on view a number of his very artistic frames, to the character of which we have referred on previous occasions.

J. DESIRE ENGLAND, 21, Charles Street, Royal Crescent, W., shows specimens of negatives on his well-known films, and also film carriers, lantern and photo-mechanical plates, and bromide opals.

T. W. COUCH AND Co., Steam Works, Dalston Lane, N.E., have a whole stand devoted to frames of all sorts, sizes, descriptions, and colours, offering a remarkably wide choice to the photographer who desires to frame his work appropriately. There were also some very fine engravings and etchings for sale, some of which would give an amateur hints on composition.

A PALMER, 36, Briar St., Nottingham, had on view a model of a new plate and print washer, to be made in either earthenware or zinc. It has several novel features, the principal being the sliding adjustment arrangement, by means of which three sizes of plates can be washed at once.

HANNAM AND McILVEEN, Atlas Works, Gainsborough, show photographic mounts in great variety, making a feature of those with the gilt bevel edge cut into various patterns.

ARUNDEL AND MARSHALL, Penn St. Works, Hoxton, N., show boxes for storing plates and negatives. They are made of cardboard and covered with dark-green cloth, making a presentable appearance, and occupying very small space.

#### Block E.

GEORGE HOUGHTON AND SON, 89, High Holborn, have a large show, one great feature, of course, being their portable dark-room, fitted with their patent sink. On the door was fixed a model of a less pretentious dark-room, covered with Willesden paper and tent canvas, but very comfortable. The "Automatic" hand-camera was on view (see illustration). The changing arrangement is most ingenious.

The lens is of 6 in. focus, and the camera can be focussed so that everything beyond five feet will be in focus. It carries twelve

plates. Another novelty was a spring for attaching to the end of the focussing cloth for the purpose of holding it securely to the camera. There is also to be seen the ladder camera stand, by

means of which a person can get himself and his camera raised above the heads of a crowd. The stand folds up into small space

and is easily carried. A striking feature was some pictures 5 ft. long taken by the "Cylindrograph," which was also to be seen. A section of the stand was set aside for the exhibition of some very tasteful frames.

### LIST OF AWARDS IN THE ART DIVISION.

#### PROFESSIONAL.

*Gold Medal for Best Alcove.*

Van der Weyde, Regent Street, W.

*Silver Medal for Best Screen.*

W. W. Winter, Derby.

#### Bronze Medals.

- Class AP, Sec. 1.—R. Keene, Derby.  
 " " 2.—R. H. Lord, Cambridge.  
 " " 3.—F. W. Edwards, Peckham.  
 " " 3.—C. Whiting, Ealing Dean, W.  
 " " 3.—Lala Deen Dayal, Indore, Central India.  
 " " 8.—A. Swan Watson, Edinburgh.  
 " " 9.—John Collier, Birmingham.

Class CP, Sec. 1.—W. M. Malby, Chichester.

" " 7.—W. L. Colls, Barnes.

Dry Point Series.—H. Flather, Peckham.

Reproductions.—S. B. Bolas and Co. Ludgate Hill.

The judges recommend an especial award of Gold Medal for Portraiture in the case of the remarkable exhibits of Mr. W. Crooke, Princess Street, Edinburgh.

*Challenge Cup* . . . . . Birmingham.

#### AMATEUR.

Silver Medal for Ladies . . . Miss Lil Tomkinson, Liverpool.

#### Bronze Medals.

- Class AA, Sec. 1.—J. A. Hodge, Chancery Lane, W.C.  
 " " 1.—B. Karleese, Birmingham.  
 " " 2.—The Rev. Precentor Mann, Bristol.  
 " " 2.—J. E. Austin, Maidstone.  
 " " 3.—C. Court Cole, Oxford.  
 " " 5.—A. R. Dresser, Bexley Heath.  
 " " 7.—Karl Greger, Islington.

Class B, Sec. 2.—J. H. Pickard, Birmingham.

Entire Exhibit.—H. Selby, London.

#### SCIENTIFIC PHOTOGRAPHS.

#### Bronze Medal.

Class AC, Sec. 3.—A. T. Stanley Kent, Oxford.

#### TRANSPARENCIES.

#### PROFESSIONAL.

#### Bronze Medal.

Class AE, Sec. 1.—F. W. Edwards, Peckham.

#### LANTERN SLIDES.

#### PROFESSIONAL.

*Bronze Medal* . . . . . G. West and Son, Southsea.

#### AMATEUR.

#### Bronze Medals.

- J. E. Austin, Maidstone.  
 W. C. Beetham, Cheltenham.  
 J. Tavener, London.  
 J. W. Wade, Manchester.  
 A. R. Dresser, Bexley Heath.  
 Dr. T. Morton, Sheffield.

**Mixed Hydrochinon and Eikonogen Developer.**—The following developer was first recommended by the Photographic Club of Paris:—

Sulphite of soda	...	...	...	100 grammes.
Eikonogen	...	...	...	15 "
Hydrochinon	...	...	...	5 "

are dissolved in 1 litre of hot water. When cooled, 50 grammes of carbonate of potash are added. This developer is used by many Viennese amateurs, and they confirm what has been said of it, namely, that the mixed bath unites in itself the good qualities of both the hydrochinon and eikonogen developers; it works as energetically as the latter, without, however, veiling the shadows, and gives the characteristic strength obtained with hydrochinon. The temperature of the developer is important—the higher it is, the more energetic the action, and thus a shorter exposure is required.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4631. **Borax Bath.**—I mix as follows: 1 oz. of powdered borax, 2 gr. chloride of gold, 10 oz. of water. The water is from off the leas of our parish church, and is filtered and boiled. I cannot get anything but a deep brown colour, and I want a deep purple. I put fifteen teaspoonfuls of the above water to a 15-gr. tube of gold chloride. The sensitized paper I use I get from Whiteley's. Do I mix the gold right?—I. C. R.

4632. **Norway and Sweden.**—Can any reader give me any information relative to customs regulations in these countries, and whether any special precautions need be taken with undeveloped plates? Is it necessary to put a special label on packets of plates, and if so, can any one tell me the correct wording for conveying the warning that the boxes must be opened in a red light only?—THRONDJEM.

4633. **Lens and Developer.**—Enquirer would thank any one very much for answering the following: (1) Is an Optimus Huryoscope better than a portrait lens for bust or three-quarter-length portraits? (2) What is the best developer for portrait negatives, using Ilford ordinary plates? (3) What distance should there be between sitter and background, scenic or plain?—ENTERPRISE.

4634. **Lens.**—Shall I find a No. 4 Ross' portable symmetrical (5 by 1½) large enough for a half-plate?—BLANCHE.

4635. **Hire of Hand-Camera.**—Can any of your numerous readers inform me where I can hire a hand-camera for two or three weeks' holiday work?—M. A. J.

4636. **Matt-Surface.**—How can I render ordinary prints dull for the purpose of copying them? I tried soaking in water and squeezing them on ground-glass, but they fell off quickly without losing the gloss.—PHOS.

4637. **Copyright.**—Is there any copyright in photographs of celebrated pictures by Landseer, Clemenson, Laocouche, etc.? I wish to copy some for a fete in Dublin.—PHOS.

4638. **Richmond (Yorks) and Barnard Castle.**—I intend spending two or three days in the City of Durham shortly, and I expect to have a day to spare, should be glad of advice as to which of the above places is best worth a visit, and also what points of interest there are in the one visited.—CUTHBERT.

4639. **S.W. of England.**—I purpose spending a holiday in the S.W. of England. Will any brother amateur who has visited both districts tell me whether Torquay and neighbourhood, or Penzance and Land's End offers the finest subjects for the camera? Quality more than quantity wanted.—ALPHA.

4640. **Landscapes.**—In taking landscapes with a R.R. lens, what advantage, if any, is gained by removing the front combination and using as a single lens? I presume the rectilinear properties are destroyed.—ALPHA.

4641. **Lens for Landscape Work.**—Which is the best kind of lens for landscape work pure and simple? I possess the R.R. and W.A.R. If any other class of lens more suitable, state advantages.—ALPHA.

4642. **Carbon Process.**—Whose is the best and simplest work on this subject for an amateur to study?—ALPHA.

4643. **Hand-Camera.**—Would any of your readers kindly tell me if I can hire a magazine detective

camera for a few weeks, and where to apply? Reference given.—DETECTIVE.

4644. **Hand-Camera.**—Will any reader kindly give advice as to purchasing a magazine hand-camera? Price not to exceed £4. To carry not less than twelve plates. Is the Rover a serviceable one? Can the Sphinx, made by Underwood, be recommended? Does a camera, to take 5 by 4 plates, compensate for extra weight and size?—PERPLEXED.

## QUERIES UNANSWERED.

April 3.—No. 45-6.

10.—Nos. 4602, 4604, 4608, 4609, 4611, 4615.

17.—Nos. 4618, 4619, 4630, 4621, 4622, 4623, 4624, 4625, 4629, 4630.

## ANSWERS.

4317. **Antwerp and the Hague.**—(1) Ten to twelve francs a day. Certainly ten days can be profitably spent. Suggestion: First day, Harwich to Antwerp (Hotel des Flandres); second and third days at Antwerp, afternoon of third day to Dordrecht (Hotel Bellevue); leave Dordrecht on afternoon of fourth day for the Hague (Hotel Central, room three francs); fifth, sixth, and seventh day at The Hague, with excursion to Scheveningen; morning of eighth day to Rotterdam by steam tram and boat via Delft (worth seeing); ninth day at Rotterdam; tenth day cross back to Harwich. (2) Good woodwork in Antwerp churches—pulpits, choir stalls, etc. No difficulties about photography; tip custodian. (3) Absolutely no advantage in taking Cook's tickets or hotel coupons; travel independently, use your common sense and gain experience. Go to office of G. H. R. in Regen's Street for tickets, and buy also Percy Lindley's "Tourists' Guide to Continent and Walks in Holland," 4½d. each at a discount bookseller's.—C. S. COBB.

4626. **Ilford Pyro Developer.**—This, like most pyro developers, cannot be used for a second plate, unless both plates are developed together in a large dish.—PHOS.

4628. **Ilford Pyro Developer.**—It is much better to mix up fresh for each plate to avoid risk of staining.—R. A. R. BENNETT.

4627. **Partial Intensification.**—

No. 1.			
Blochloride mercury	...	...	60 gr.
Water	...	...	6 oz.

No. 2.			
Iodide potassium	...	...	90 gr.
Water	...	...	2 oz.

No. 3.			
Hypo sulphite sodium	...	...	120 gr.
Water	...	...	2 oz.

Mix Nos. 1 and 2 and add No. 3. When the negative has been softened by soaking in water, dip a sponge or some cotton wool in the above solution, and rub it gently on the part to be intensified. Take care that the intensification is gradually shaded off, or a hard line will be made in the negative.—CAILLON.

4628. **Negative, Film Inside.**—Make a dry plate transparency of the reversed negative, and copy it in the camera; the film of the transparency being turned away from the dry plate. Another way is to print the reverse negative on carbon tissue, and mount upon glass, and copy by contact, or in the camera with the film towards the dry plate.—CAILLON.

4628. **Negative, Film Inside.**—If the negative is a good one you could print it by the Autotype process, and get the right picture, as prints by this process are reversed. You can get materials from the Autotype Company, Brownlow Road, Baling Dene, W. Or you could make a transparency from the negative on a film, and then make another negative from the transparency, placing the gelatine film of the plate to the celluloid side, which would give you a correct negative.—R. A. R. BENNETT.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S POST if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

R. E. D.—Mix the washing and developing solutions, and add one quarter of the volume of saturated solution of sulphate of iron, and heat in a porcelain dish till it boils, when the platinum will be precipitated and can be collected on a filter, well washed with hydrochloric acid to wash out the iron, then dissolve in aqua regia.

E. BONY.—(1) About four lamps. (2) It is far preferable to use the flash-light than ordinary ribbon, but we should think about twelve inches in each would do.

W. H. MERV.—The printing-out effect is by no means novel; it is a very well-known fact that an image though weak can be obtained on bromide of silver by printing-out.

F. G. READER.—Certainly have a turntable; its advantages can be better shown than described here. Call and see a whole-plate camera fitted with turntable now at our offices. We will then speak to you about the lens. You will note we call attention to the vacancies in your portfolio club.

F. W. LAUS.—Glad to hear from you. Will write you later on.

J. GOULD.—We note your letter.

C. L. STRYVENSON.—Using the special instantaneous plates you name you cannot do better than use f/16. This opinion we have had corroborated by the maker of the camera.

ALFRED CORNISH (Melbourne).—We will have the matter thoroughly investigated, and write you by an early mail.

FER. OX.—There is no possibility of obtaining a stronger solution of ferrous oxalate than by the aid of neutral oxalate of potash; the only question is whether you are using the formula which gives the strongest solution. The following will give you as strong a solution as it is possible to make:

Neutral oxalate of potash	...	172 gr.
Ferrous oxalate (dry)	...	144 "
Distilled water, to make	...	1 oz.

Dissolve the oxalate in the water and add the dry ferrous oxalate, and allow to stand for twenty-four hours, shaking frequently, then decant from any undissolved oxalate. This is about three times the ordinary strength.

H. F. C.—Your camera will not rack out far enough to enable you to get close to your sitter, so that you would only obtain an image just double the size of that taken with your R. R. when working at its equivalent focus. As using one of the combinations of your lens practically doubles your focus, you would be unable to use an aperture of f/8 merely because the mount is not large enough. You can use an orthochromatic plate without a yellow screen. If you keep your solution in the dark it is immaterial what colour bottle you use. Can you not call on us one Monday afternoon?

ACRAMA.—13 ft. by 8 ft. is hardly large enough for a studio for group work, though you might do very well for single figures of three-quarter-length or busts. We should advise you to obtain a copy of Robinson's book "The Studio, and What to Do in it," which will give you all the information you want. Our publishers will supply for 3s. 6d.

GLADYS.—Your plate is over-exposed and insufficiently developed, and your camera was not quite upright. It would do you no harm to try in a competition, but of course it depends a great deal upon the other work sent in as to your chance.

REV. F. PARTRIDGE.—The pinholes may be due, and probably are, to minute air bells adhering closely to the film. Try passing your finger over the plate when covered by the developer, and let us hear from you again and send us a negative showing the holes.

NOVICE.—You will find pyro far the best developer for a novice. It is a difficult matter to state which is the best washer in the market. Evers has a very good one, and Wood's is also an excellent washer.

H. L. W.—The formula you enquire about is:

Glycerine	...	...	5 oz.
Water	...	...	15 "

Soak the prints in this for ten minutes and dry. The addition of uranium nitrate to a toning bath has a tendency to give blacker tones; it would therefore act in this respect with tungstate.

MUWA.—It is quite true that the quantity of citric acid and bicarbonate of soda will not dissolve in 2½ oz. of water, but the citrate of soda will, and this is what is required. So far as regards the sulphite, the following will probably get you out of your difficulty. Mr. Wall says "Sulphite of sodium is stated to be soluble one part in four; practically 100 parts of distilled water at 58 degs. F. will dissolve 58 parts of the recrystallised salt, but a slight drop in temperature will cause precipitation of some of the salt; we may, therefore, consider that one in three is a fair strength to use." (Anthony's "International Annual," vol. ii., p. 264.) Judging from your expression, "and have failed to keep the sodium sulphite in solution after it cooled down," you are using heat to dissolve your salt; if this is so, you get a weaker solution in the end than by using water at the ordinary temperature, as excess of salt always crystallises out, and crystals once formed there is a tendency to further aggregation of crystals. We have not had the slightest difficulty in preparing the developer as given; the distilled water was gently warmed so as to avoid the great lowering of the temperature, which occurs when dissolving sodium sulphite and most salts, and now, three weeks after mixing, there are no crystals. Provided the temperature of the solution does not fall below about 60 degs. the stated quantity of sulphite will keep dissolved, and if you get crystals you must consider that it is a sign that your solution is too cold, and a cold developer never gives such even results as one used at a regular and correct temperature of 58 degs. F. This, the temperature of developer, is a point well worth consideration for any amateur. We are much obliged to you for pointing out what may be difficulties to others besides yourself, and we shall be pleased to assist

you further if we can, and will shortly have a leader on the subject.

**FLETCHER HILL.**—The fault of want of density may be due to over-exposure, which may be the case with you, and also to not continuing the development long enough, or to insufficient pyro. Try adding more pyro towards the end of the development, and if this is not successful send us up a negative or two to look at, and an exposed but undeveloped plate. The black precipitate in your gold is metallic gold reduced by impurity in the water. It strikes us that you might print deeper and make your fixing bath alkaline by adding ammonia to it. What bath are you using? (1) Over-exposed. (2) Ditto. You might cut off the lower half of this print without any loss; you should have used one of the combinations only of the lens for this. (3) Over-exposed; the camera was all askew. (4) Over-exposed; camera all wrong again. (5) Under-exposed; the figure might have been removed with advantage. (6) Over-exposed; camera again out of perpendicular. Are you printing in the sun? Write us again.

**BEE.**—The studio you suggest is rather narrow, in fact very narrow. We do not know where you could get such a thing as a portable studio such as you want. You might try one of Humphrey's iron buildings, but we must warn you that the London County Council have a voice in the erection of such a thing unless it is on wheels, when it becomes a vehicle and out of their control.

**CESTRIA.**—(1) You ask us what we are utterly unable to answer unless you let us know the speed of the racehorse and the focus of the lens. It may be of interest to you, however, to know that at the finish on a short course a horse may travel about nineteen yards per second. Now supposing your lens is of 8 in. focus and you are 40 ft. from the horse, your shutter would have to work at rather a high speed, thus—

Horse moves 19 yards = 634 in. per second.  
40 ft. = 480 in.  $\div (8 \times 100) = 480 \div 800 = \frac{3}{5}$   
 $634 \div \frac{3}{5} = 1,140$ .

$\therefore$  The shutter must work at  $\frac{1}{1140}$ th of a second. When you get hold of such a shutter please let us know. The shutter mentioned in your query is utterly useless for the above purpose. (3) Probably; at any rate, we will let you know.

**ARTHUR JANE.**—We should certainly advise you to stick to your present lenses; you would find them far more satisfactory, as the other lens is merely a cross between the two you have and does not possess the rapidity of your portrait lens, which is a great essential. We admire your honesty, and should advise you to practice well till you can drop the amateur altogether. It is a new term to us, but we shall be pleased at any time to help you or any other "amateur-professional." Prints not yet to hand.

**TE WIRIRIU.**—You certainly could use your lens as you suggest, but you would not get the flowers more than life size, and only one plane would be in focus and the result would be delightfully fuzzy and naturalistic. The chloride print you sent is much better than the platinum. To calculate the decrease in ratio aperture it is only necessary to measure the distance between racked out lens and screen and divide by the aperture of diaphragm. We should certainly advise you to wait a little longer before getting a new lens.

## Quarterly Examinations in Photography.

### QUESTIONS.

- Forward a landscape print in which the clouds obtained for question 6 have been printed. The print must be toned, etc., but not mounted.
- An operator is using a 15 in. focus lens with a diaphragm of  $\frac{3}{4}$  in. aperture, and wishes to use a 9 in. focus lens with a diaphragm of same aperture,  $\frac{3}{4}$  in. What will be the relative exposure required for the same subject with the second lens under precisely similar lighting, and how is this determined?
- What is the action of a solution (a) of sugar, (b) glycerine, (c) potassium bromide, (d) potassium citrate, in the developer? Explain your answers.

(Latest Day for Answers—May 4th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

THE slides contributed to the fourth Monthly AMATEUR PHOTOGRAPHER Lantern Slide Competition were passed through the lantern at our offices on Monday last, and the prizes awarded to the following competitors:—

### First Prize (Silver Medal).

EDWARD BRIGHTMAN .. .. Bristol.

This gentleman's contribution were a view of Wells Cathedral, west front, and a magnificent slide of the altar piece at Christ Church, Bristol. This slide was far and away the best sent to the competition.

### Second Prize (Bronze Medal).

W. LAMOND HOWIE .. .. Eccles.

The best of the two slides sent by this competitor was certainly the "Interior of Church, Ober-Ammergau," a picture full of detail, both in light and shade.

### Third Prize (Certificate).

G. F. WILLS .. .. Wigan.

Two very fine views of Wells Cathedral, in which point of view and technical work are both excellent.

The remaining sets, sixteen in all, were classed as follows:—Six sets 1st, seven 2nd, and three 3rd class. The full list, with titles, plates used, and developer, is given in the *Photographic Reporter* for this month.

THE exhibition of the 1890 AMATEUR PHOTOGRAPHER Prize Lantern-slides brought together at our offices a large audience; in fact, the rooms were packed to the door, and the slides received, as they have done whenever they have been shown, a most hearty welcome. The novel feature of introducing each set by a portrait of the prize-winner projected on the screen, added much additional interest. It was gratifying to us to find many ladies amongst the audience, and the success of our invitation will prompt us to repeat such evenings, commencing in September next. On every fourth Monday a popular lecture or demonstration upon photography will be delivered, after which discussion will be invited, and an exhibition of lantern slides will conclude each evening's entertainment. We have no doubt that our "Monday evenings" will become as popular and as well attended as the Camera Club "Thursday evenings." We are preparing a syllabus of lecturers and demonstrators, and shall be glad of suggestions from any of our readers.

It is proposed to start a photographic society at Guernsey. We shall be very pleased to supply further particulars to any of our readers who may be wishful to assist the movement.

NEXT Wednesday Mr. Valentine Blanchard will commence his course of four lectures on "Art in Relation to Photography," at the Polytechnic Technical Schools, Regent Street. Fees for the course, one guinea. Mr. Blanchard is so well known as an artist, as well as a photographer, that we feel sure many of our readers will gladly avail themselves of the opportunity of attending his lectures, from which, we are sure, much may be learnt.

ANOTHER course of six lectures are to commence at the Central Institution, City and Guilds of London Institute, Exhibition Road, South Kensington, on Wednesday, the 6th, by Mr. H. Chapman Jones, F.I.C., F.C.S., etc., on "Photography," treated from a practical and scientific point of view. Fee for the course, five shillings.

IN accordance with ancient custom, we publish our list of "Dark-rooms," which is fairly complete, but we would ask our readers and also all photographic dealers or professional photographers to advise us if they have a "dark-room" which may be placed at the service of the travelling amateur photographer. We cannot spare space to publish the "dark-rooms" that have been placed at our disposal

on the Continent, but we have a very considerable number, and can give a private letter of introduction to subscribers practising photography in practically every city of any size on the Continent and in our English colonies.

Especially we wish to secure the use of "dark-rooms" in all principal sea-side towns and touring centres. We shall also be glad to hear from the owners of the different steamboat routes as to the accommodation, photographically, for passengers on board the boats, especially the Scotch and Irish boats.

VERY shortly we shall be able to supply very complete information respecting "Holiday Resorts and Photographic Haunts," and shall publish a list of the names of districts and towns which have already been dealt with in these columns, and will then ask our readers to kindly contribute short articles upon places of interest to the photographer that are not included in the list. In this way all may help to make our "Holiday Resorts and Photographic Haunts" a complete photographic gazetteer. The following simple rules will help contributors:—

- (1) The best starting point, the nearest large town.
- (2) Distance to places, and objects of interest.
- (3) The best route, conveyance, and cost.
- (4) If permission to photograph be required.
- (5) The situation of the subject, and at what time the light is most suitable for securing a photograph.
- (6) The nearest "Dark-room" available.

Contributions should not exceed 500 words, must be legibly written on one side of the paper only, and no attempt should be made to give discursive accounts of the objects to be photographed, but each account should be practical and brief.

WE have amongst our subscribers many masters of public boys' schools, and would specially call their attention to the "Public Schools Competition" we are promoting. Some thousand schools have been selected, and we are sending a circular letter to the head master enclosing an entry form, and asking him to draw the attention of the boys under his charge to the conditions, which we may add are not of an onerous character. These will be posted on the 4th inst., in order to be in the hands of the head masters on or about the first day of term. We shall, of course, be pleased to forward entry forms to any public school boy under seventeen years of age, upon receipt of stamped addressed envelope. The last day to send in photographs is fixed for the 17th of June.

### HOME PORTRAITURE.

AN important point, and one often neglected by the amateur operator, is the direction of the eyes. It is no uncommon thing to see a rather fine large head, with good gradation and modelling, facing a point slightly to one side of the camera, probably about six inches from the lens, whereas the eyes are directed to a point at least three times that distance from the camera. In other cases the eyes are elevated till it might be assumed that the sitter was trying to illustrate the forcible but not over-elegant phrase, "a dying duck in a thunderstorm." The question of how to avoid the dying duck expression and how to obtain a pleasing expression on the sitter's face is one by no means easy to decide, the latter portion, at any rate. A very good plan is to place a decent-sized mirror in front of the sitters, and allow them to look at themselves in that, when, as a rule with sitters of mature age and sound judgment, it is by no

means a difficult operation for them to so command the facial muscles as to put on a pleasing look when they can see themselves. The old formula of "Wet your lips and look pleasant, please" has almost disappeared, simultaneously with the habit of the operator turning his back on the sitter. There is a tale, the veracity of which, however, we will not vouch for, that a tintype worker used to draw on the once whitewashed wall of his studio and tell his visitors to "look at that and look pleasant," possibly a difficult matter. We have personally, however, worked in a studio where it was customary to tell sitters to look at a little gaudily-painted box, and at the same moment as the lens shutter was raised, a little Jack-in-the-box sprang up and "put his thumb unto his nose and stretched his fingers out." The effect of this on the sitters was marvellous; in some a genuine home-made Cheshire grin appeared, in others the jaw dropped in surprise, in juveniles the eyes extended; so finally poor Jack was relegated to the shelf, as these results were by no means artistic.

It is far better to use merely a looking-glass; some writers use a picture, others have recommended a clock, etc. Whatever is used, however, let it be a fair size, and tell your sitter not to be afraid, but to blink his or her eyes as usual, and not to fix them in a steady glare, as though trying to freeze somebody. Above all things, let your sitters be natural. If a lady, give her a piece of needlework, and tell her to work at it, then drop it in her lap, and look up as though going to speak. For young ladies a doll, animate or inanimate, may be of use; in the former case, however, it is preferable to have one that will sleep—some won't, or at least we have come to that conclusion. For a gentleman, give him a stick, cigarette, cigar, or pipe, or let him stand by a table on which lie hat, gloves, and stick, and tell him to begin to pick them up. For smaller boys, a top or game may be utilised. Who does not know Rejlander's picture, "The Game of Chess"? Here there is an excellent chance for a group; two persons playing chess, one leaning back looking rather pleased, the other leaning over the board "with bent brow and eye intent," whilst behind a third may stand smiling at the triumphant player. Call this "A Poser" or "In a Fix," what you please, only whatever you do carry the thing out properly. Place the chess men in a difficult position—not as we saw them a week or two back in a picture, a chess board without a single piece lost; not that we mean to infer difficult situations do not occur then, but they are more likely to at the end of a game. Then again, for a group of four, what is better than a scientific rubber of whist? Here, too, put your accessories in; the markers, the second pack, the played cards in the middle of the table, the tricks won, etc. We may possibly make the title tell the tale; for instance, "The call for trumps." Or again, let one party be scoring, the other counting the tricks—"Two by tricks and honours easy;" or a more difficult subject still, "Trumped my ace, by gad, sir!" Surely this recalls the choleric, stout old gentleman, rising in hot haste, his hand flung down, the chair upset behind him, whilst the luckless wight who has been unfortunate enough to "trump my ace," stares in shivering astonishment at his wrathful partner and triumphant opponents, one of whom leans back enjoying the joke with a rude guffaw, the other calmly smiling at the wretched culprit. We might go on giving our readers hints without end, but must content ourselves by impressing on them the importance of having everything in harmony. Give your sitters something to do or hold that they are in the habit of using, and they'll immediately fall into natural attitudes; but give a man a violin or something he knows nothing about, and he will immediately look as though it was some strange thing, and nothing you can do will prevent it.

## Letters to the Editor.

### MAGNIFICATION FOR PHOTO-MICROGRAPHY.

SIR,—I read with much astonishment the extract you copy on page 282 of the *AMATEUR PHOTOGRAPHER* of the 17th inst., when it appeared in the *International Journal of Microscopy*, and came to the conclusion that some of the context of Mr. Nelson's paper must have been omitted, as I do not think he would be prepared to support the impression the extract gives, namely, that an inch objective is the highest power required for useful work in the photo-micrography direction.

The figures also do not agree. The initial power of a lens in microscopy means the number got by dividing ten (10) inches, the normal distance of distinct vision, by the nominal focus of the lens; thus an inch objective magnifies ten diameters, and a quarter of an inch forty diameters, etc.

Now, if an "eye-piece giving twenty times the initial power of a lens" is applied to an inch objective, the result is 200 diameters, not 1,000.

There is no doubt 1,000 diameters can be got with an inch objective in many ways, but using it as above it would want an eye-piece of a tenth of an inch focus, magnifying 100 diameters, and, optically, it is more rational to reverse the operation, and have an inch eye-piece and a tenth of an inch objective, as the errors of the first magnification in this latter case would be magnified ten times, instead of a hundred times.

Again, to get a useful magnification of 1,000 diameters it means a resolution of 100,000 to 200,000 lines to an inch, and this requires a high numerical aperture, which would cause the lens to work very close to the object. Now at present there are no inch objectives made, and opticians as yet cannot make them of this high aperture; and if there were, they would, as far as one sees, have no practical advantages over the high powers which are really meant for this work.

I apologise, Sir, for the length of this letter, but think it is unfair to let statements go forth which might deceive beginners, and disgust them with an interesting field of research; and why the *International Journal of Microscopy* did not give fuller details I do not understand.—I am, Sir, yours, etc., T. G. P. VEREKER.

NOTE.—The statement is as given in the *International Journal of Microscopy*.—Ed. AM: PHOT.

### MR. SUTTON'S PROCESS.

SIR,—In your report of the proceedings of the Camera Club Conference you give an extract from a paper read by Mr. Sutton on a "new" mechanical process.

Such a method never having been published, and Mr. Sutton being the first to give same to the world, is justly entitled to call it new, but that Mr. Sutton was not the first in the field the following facts will show.

Four years ago I had the honour of demonstrating a similar process to a well-known firm of photo-etchers, who pronounced it to be of no commercial use for block work, but as a means for preparing gelatine negatives for mechanical work it was invaluable.

*Process.*—A grained gelatine negative is immersed in a weak solution of ferricyanide of potassium, well washed, the superfluous moisture wiped off, slowly heated by the fire, the final heating being given on a piece of smooth zinc over a Bunsen flame. It is then rolled with a hard lithographic roller, bronzed, and forthwith used for printing.

Negatives treated thus give results equal to, if not superior to, the wet-plate negatives.—Yours truly, G. J. BROWNE.  
43, Smollett Street, Kensington, Liverpool,  
April 20th, 1891.

\*\*\*\*\*

### CIRCULAR DETECTIVE CAMERAS.

SIR,—I have a suggestion to make with regard to these cameras, which I think, if it were adopted, would make this particular form of instrument more popular than it is at present. The circular dry plate which is manufactured for these cameras, and round the circumference of which the photographs, generally six in number, are consecutively taken, has, I think, two distinct disadvantages—(1) the possessor of one of these instruments may perhaps only wish to take two or three snap-shots during the one day, and therefore his desire to develop and see the result of his work—a desire generally so eager with an amateur—has to be

restrained till the complete series of six is taken, in order to avoid the waste of the remaining portions of the plate; (2) as the exposure is made by a partial revolution of the circular plate on its axis, and is constant, and as the actinic intensity of the light varies, it follows that some of the exposures made on this one plate will require a longer development than the others, and this, I take it, cannot be attained when the whole series of six are developed together in the one developing dish.

Now, my idea is, not to make any alterations in the external appearance of the camera—let it be circular as before, and with its usual circular internal carrier—but let this carrier be provided with grooves to carry six square plates, each plate to be brought in turn before the lens by a partial revolution of the carrier as in the old form. The camera could then be fully or partly charged as wished, and each plate could be individually developed, which would, I think, be a distinct advantage.—I am, Sir, yours truly,  
Cork, April 25th, 1891. R. YOUNG.

### WHAT IS MEANT BY THE TERM "INSTANTANEOUS" AS APPLIED TO PHOTOGRAPHY?

SIR,—I have reason lately to wonder what meaning is intended to be attached to the term "instantaneous," by which a class in our exhibitions is usually distinguished. Instantaneous applies to a period of time, and being a wholly undefined period leaves the class it qualifies equally undefined. I always understood the term to apply to a duration of time within which moving objects might be photographed, and that a picture is not fairly qualified for the class unless it contains a moving object. I have, however, recently seen medalled pictures in this class which according to my understanding of the class are unqualified, being simply landscapes with figures, the figures being quite secondary to the landscape. The difficulty attending the production of rapid work is such that it is impossible for such work to compete with landscapes where the judging is done without reference to the objects of the class or the difficulties attending the production of the work. In my opinion the word "instantaneous" should be discontinued, and the term "moving objects" substituted. This term will exclude unqualified and doubtful pictures, and place more clearly before the judges the characteristic features intended to be most prominent in the consideration of merit.—Yours truly,  
LOUIS MELDON.

Dublin, April 24th, 1891.

\*\*\*\*\*

### WHAT IS AN AMATEUR?

SIR,—Living in London, as you may suppose, I paid a visit to the Crystal Palace Exhibition, and was very pleased with the day's outing; the show was well worth the visit. But I was much struck by noticing there a picture, "My Sister," by W. Smedley, which I believe is the same as you reproduced in the *Photographic Reporter* recently. The fact that it was so reproduced is not at all extraordinary, it deserved to be so treated, but what was extraordinary was the fact that in the catalogue it was marked 10s. 6d.! This really surprised me, for I understood your competitions were only open to amateurs, and that amateurs would not, or rather should not, sell their work.

I then began to investigate further, and found pictures, marked with prices, in the following names, entered in amateur classes: Capt. G. H. P. Burne, W. H. Whittard, C. Higinbotham, Leslie Selby, George H. Firth, Louis Meldon, and Miss J. S. James.

I should like to know, Sir, whether, under these circumstances, the pictures being shown at a public exhibition, these exhibitors, if they were so before, can any longer be considered amateurs, and should be glad to hear the expression of your own views and those of your readers upon the point.—Yours, etc.,  
April 27th, 1891.

AN ENQUIRER.

\*\*\*\*\*

### PHOTOGRAPHY WITHOUT A LENS.

SIR,—Allow me to correct a printer's error in my paper on "Pinhole Photography" in your issue of last week. Page 297, first column, line 19 from bottom, for 2,560 secs. read 256 secs.—Yours, etc.,  
ALFRED MASKELL.

**To Remove Silver Stains from Negatives.**—A solution of 1 part of iodide of potassium in 20 parts of water is recommended. The negative is laid in this solution until the stains disappear. The bath can be used repeatedly until it becomes milky. The negative is not injured in any way by the solution.

## Photo-Micrography.—VIII.

BY ANDREW PRINGLE.

### PRINTING.

WE now, in the usual order of photographic matters, come to consider the processes which we deem the best suited for producing paper or other prints from our negatives. It will be at once realised that whatever may be the chief *desiderata* for printing with a special view to artistic results, our required qualities are: (1) sharpness of detail, and (2) a long and perfect scale of gradation in many cases. We certainly do not need much gradation in all cases, but our printing process—if we propose to adopt one only—must have the power of giving good gradation when we are dealing with a certain class of subject, such as stained preparations of physiological specimens, as well as preparations of insects, sections of rock, and, in short, any subjects not consisting of merely opaque and absolutely clear tissues. This is as much as to say that we must either use more than one printing process, or else choose one process capable of yielding different kinds of results at our will.

We may say at once that it may be taken that all processes of printing on so-called matt surfaces are in most cases barred at the outset, on account of the impossibility of getting on such surfaces prints with details microscopically sharp; it is quite certain that a smooth surface will give sharper detail than a surface rough in even a small degree, more particularly as the image on the latter sinks more or less into the body of the paper. Therefore, unfortunately, we must shelve for our purpose the fine platinotype process as well as the other processes of printing on plain paper. Still, it is not to be denied that the platinotype process and others of the same nature may be used with good effect for delineations of what I may call "general appearances," where we wish to show merely the coarser details of an object and the relations of position between one part and another. For instance, I employed to my great satisfaction the platinotype process in the case of some large sections of diseased bones and joints where there was no need to show the histological details of the specimens.

From a broad point of view there need be no great departure from usual procedure with any of the processes which we may adopt; but at the same time it may be useful to point out certain matters tending to make the best of common processes for our particular necessities, and on a few of these points I propose to dwell in this chapter.

To begin with the albumen process. It is pretty evident that in order to obtain the sharpest prints we must have perfect contact between our paper and our negative. This is best obtained by having strong pressure on our paper by means of specially strong springs in the printing frame. The pad for backing the paper in the frame should be of some flat-lying material, such as sheet india-rubber, and not of felt or any such uneven material. Moreover, it is even more vital in our work than in ordinary printing that the negative and paper should be allowed to attain the same temperature before the exposure is allowed to begin; if this is neglected, perfect contact between paper and negative will not be obtained; indeed, if the temperatures of paper and negative are very different, and if there be much moisture in the air, the paper will actually leave the negative in places, and a blurring will result, as doubtless many readers have found.

As to tone, this is wholly a matter of taste, but it will probably be found that a warm tone is less suitable for our

work than a blue or blue-black. To obtain tones of these latter classes the sulpho-cyanide process or Mr. Clark's platinum toning process may be used; but if a warm tone is desired—as, for instance, to imitate some of the ruddier stains—then the ordinary gold toning solutions may be used, care being taken not to carry the toning process too far. It must, however, be remembered that when toning is stopped too short there is grave danger of the results not being permanent.

The gelatine-emulsion papers, known by such names as "aristotype," are very suitable for this kind of printing. The amount of fine detail rendered by these processes is greatly in their favour, and by their use we have at command a fair variety of tones. The only caution I would offer to those who may be using these processes for the first time is that the tone must be judged by transmitted, not by reflected, light. If the tone as seen by transmitted light has any red left in it, the toning is not complete, however blue the prints may appear by reflected light as used for judging the progress in albumen processes.

But in my own work I always use bromide paper for printing photo-micrographs. The quality of result can be varied to a very great extent, and a negative of very poor technical quality can often be made to yield an excellent print. And it is not to be forgotten that frequently the best negative we can get from a preparation is not at all a good negative from the technical photographic point of view; and it is a strong point in favour of any process if we can obtain from a poor negative a good or moderately good print. Moreover, the tones to be got from the bromide papers appear to me well suited for the printing of scientific subjects; the warm blue-blacks and the clear high lights are just what we require.

I always use the ferrous oxalate developer for work of this kind, and I do not think that there is any better developer for the purpose. According to the result desired and the nature of the negative, we may vary our developer, but the variations have not very wide limits. As a rule, a solution strong in iron will give stronger shadows, provided the exposure is kept down to suit the strength of developer; whereas by keeping down the proportion of iron we may produce results with more harmony or "softness." So when I am dealing with a subject of violent contrasts, I use about one of my iron to eight of oxalate, but if my negative is weak from any cause, I keep down the exposure and use about one of iron to four or five of oxalate. Bromide is always used in the developer, but half a grain to each ounce of developer is enough.

In making stock solutions of iron and oxalate there should be no difficulty. In a large bottle I keep always a quantity of water, into which is put from time to time a quantity of the oxalate; the bottle gets a vigorous shaking now and then, and there is always some oxalate undissolved at the bottom of the bottle; the temperature is always about 60 degs. Fahr. The bottle should be shaken just before any of the solution is taken out to make developer; and the solution should be filtered before use. The iron solution is made thus: to about a pint of water I add one drachm of sulphuric acid, and with this acid water I dissolve as much protosulphate of iron as the water will take up at 60 degs. Fahr. Some iron should be always visible at the bottom of the bottle, and this solution will keep good for a very long time—months anyhow. These solutions being made up, a "normal" developer may consist of one part of the iron to six parts of the oxalate solution, half a grain of bromide of potassium being added to each ounce of developer.

There is no harm in using any of the quinol developers formulated by many writers and manufacturers; in fact, some of these give results as good as can be got by ferrous

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

oxalate; but my own experience is that ferrous oxalate gives, if anything, the best tone with the greatest certainty and least chance of failure. Eikonogen I do not like nearly so well for this purpose, but I admit this may be from my less experience of eikonogen for the purpose. The following formula has answered better in my hands than any other eikonogen formula I have tried; it is of American origin, and answers well for lantern slides:

Water .. ..	500 parts .. ..	1 oz.
Sodium sulphite ..	10 " .. ..	10 gr.
Eikonogen ..	5 " .. ..	5 "
Potassium carbonate	2 " .. ..	2 "

This keeps well for a week or so, and is good for giving images full of detail without great density.

No special steps are required for printing micrographic images on bromide paper; I take for granted that every reader uses acidulated water for the first washing after development with ferrous oxalate.

It need hardly be said that a photo-micrograph shows better as a lantern slide than in any other shape; and for slides we may use the ordinary lantern plate of gelatine-bromide, or collodion, or albumen. The ferrous oxalate developer may be used for gelatine bromide plates; here at least I decidedly prefer iron development to alkaline. But for the very best results the albumen process should be used. Unfortunately, I cannot here describe this beautiful process.

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 245.)

**Nitric Oxide**, NO, is formed by the action of moderately strong nitric acid on copper, mercury, and some other metals, or in a purer condition by the action of nitric acid on ferrous salts. It is a colourless gas, almost insoluble in water, not combustible, and only supporting combustion under certain special conditions. It is characterised by its property of forming red-brown fumes when it comes in contact with air or any other gas containing free oxygen. The red-brown product consists of nitrogen peroxide if the oxygen is in excess, and of nitrogen peroxide mixed with some nitrogen trioxide if the nitric oxide is in excess.

**EXPERIMENT 123.**—Into an apparatus similar to that used for the preparation of hydrogen put 15 grammes of copper turnings, and pour down the funnel-tube about 40c.c. of a mixture of equal volumes of water and strong nitric acid. Observe that the flask at first becomes filled with a red-brown gas, which afterwards disappears, but the gas which bubbles through the water in the pneumatic trough forms red-brown fumes as soon as it comes in contact with the air. Collect two bottles of the gas over water in the usual way, and into one introduce a lighted taper and observe that the taper is extinguished and the gas does not take fire. Bring the other in contact with a similar bottle filled with air, and allow them to remain with their mouths together for some minutes. Observe that a red-brown gas is formed, but if the bottles are placed with their mouths under water the red-brown gas is absorbed and the water rises in the bottles.

**Nitrous Oxide**, N<sub>2</sub>O, is a colourless, odourless gas, obtained by the action of heat on ammonium nitrate, NH<sub>4</sub>NO<sub>3</sub>=N<sub>2</sub>O+2H<sub>2</sub>O. Like oxygen, it rekindles a glowing splint of wood, but it is easily distinguished from oxygen by its much greater solubility in cold water. When inhaled, it first produces excitement, which is manifested in various ways, and hence the gas is often called laughing-gas. If breathed for some time, it produces insensibility, sufficiently complete

and lasting for a sufficient length of time to permit of the performance of minor surgical operations, such as the extraction of teeth.

### THE HALOGENS.

The halogens, haloid elements, or haloids are fluorine, chlorine, bromine, and iodine, four elements that are closely related to one another. The term halogen (Greek, *hals*, sea-salt; *gen*, to produce) is derived from the fact that by combination with potassium and sodium these elements form compounds very similar to common salt or sea-salt.

**FLUORINE** occurs chiefly in combination with calcium, forming calcium fluoride, CaF<sub>2</sub>, which constitutes the mineral *fluorspar* or *fluorite*, also known as Blue John and Derbyshire spar. It occurs massive or crystallised in cubes: colourless, yellow, green, rose, and purple. Fluorine occurs also in combination in small quantity in the bones and teeth. The element itself can only be isolated by the action of a powerful electric current on liquefied hydrogen fluoride in complete absence of water. It is a colourless gas which combines explosively with hydrogen even in the dark, decomposes water with formation of hydrogen fluoride, HF, and liberation of oxygen, and combines directly, even at the ordinary temperature, with almost all the elements.

The compounds of fluorine with the other elements are termed *fluorides*. The metallic fluorides, with the exception of those of sodium, potassium, and silver, are insoluble in water, but dissolve in dilute acids.

**Hydrogen fluoride**, HF, is most easily obtained by the action of strong sulphuric acid on calcium fluoride.

**EXPERIMENT 124.**—Into a dish made of platinum or sheet-lead put some powdered fluorspar, add some strong sulphuric acid, and warm *very gently*. Observe that a colourless, fuming, intensely irritating, and strongly acid gas is given off. CaF<sub>2</sub>+H<sub>2</sub>SO<sub>4</sub>=2HF+CaSO<sub>4</sub>.

This gas is very soluble in water, and the solution constitutes the ordinary hydrofluoric acid, an intensely corrosive acid, which must be handled with the greatest care. Both the solution and the gas attack glass rapidly, and hence the solution must be kept in leaden or gutta-percha bottles. For the same reason the solution or the gas can be used for etching on glass.

**EXPERIMENT 125.**—Coat a piece of glass with bees-wax by gently warming it, and when the wax has hardened, scratch a design upon it with a needle, so as to expose the glass beneath. Place the glass with the waxed side down over the dish in which hydrogen fluoride is being evolved. After a short time remove the wax, and it will be found that where the glass was not protected by the wax it has been corroded.

Fluorine is characterised by an especial attraction for the element silicon. Glass contains silicon in combination with oxygen forming silica, SiO<sub>2</sub>. When silica comes in contact with hydrogen fluoride, the following changes take place: SiO<sub>2</sub>+4HF=SiF<sub>4</sub>+2H<sub>2</sub>O. The silicon fluoride SiF<sub>4</sub> is a gas, and hence the solid silica becomes converted into liquid and gaseous products. A similar change takes place not only with pure silica, but also with glass, porcelain, and all substances that contain silica.

**CHLORINE** is rarely found in the free state in nature, but occurs in large quantities in the form of sodium chloride or common salt, and also in combination with magnesium and potassium. The element itself is obtained, directly or indirectly, from its compound with hydrogen, and therefore we will investigate the latter first.

Chlorine forms with hydrogen only one compound, *hydrogen chloride*, HCl, or *hydrochloric acid gas*, which can be obtained by the direct union of its constituents, but is more easily prepared by the action of strong sulphuric acid on sodium chloride or some other chloride.

EXPERIMENT 126.—Put some salt in a test tube, and add a small quantity of strong sulphuric acid; a colourless, strongly fuming, strongly acid, and irritating gas will be evolved.  $\text{NaCl} + \text{H}_2\text{SO}_4 = \text{HCl} + \text{NaHSO}_4$ .

EXPERIMENT 127.—Into a flask of 500 c.c (20 oz.) capacity, fitted as in fig. 22, put 30 grammes of salt. Arrange a dry gas bottle, mouth upwards, so that the delivery tube from the flask just reaches to the bottom of the bottle, and cover the mouth of the bottle with a slightly greased card, in which is cut a notch to allow of the passage of the delivery tube. Dilute 50 c.c. of strong sulphuric acid with 25 c.c. of water, and pour part of the mixture down the acid funnel. When the collecting bottle is full of gas (*i.e.* after fumes have been escaping from the mouth for some time), remove it, cover the mouth with a piece of glazed paper slightly greased with lard, and put another bottle in its place. (a) Remove the paper cover from one bottle, and observe that the gas fumes strongly when it comes in contact with the air; introduce a lighted taper into the gas, and observe that the taper is extinguished, but the gas does not take fire. (b) Invert the second bottle with its mouth under water, and observe that the water rapidly rushes up into the bottle, showing that the gas is easily absorbed by cold water.

EXPERIMENT 128.—As soon as the second bottle of gas in the preceding experiment is full, put the end of the delivery tube into a small beaker containing 25 c.c. of water. Observe that at first the gas is completely absorbed, but after a time some begins to escape into the air, and at last the liquid is saturated and no further absorption takes place. (When the evolution of hydrogen chloride slackens, pour some more of the sulphuric acid down the acid funnel). You have now prepared some strong hydrochloric acid, which is simply a solution of hydrogen chloride in water.

N.B.—All the experiments with hydrogen chloride should be done in the open air or in a place where there is good draught.

Ordinary hydrochloric acid is made in a similar manner, and of course is similar in composition. When pure, it is colourless, but fumes when exposed to air, and although corrosive is less energetic in this respect than nitric or sulphuric acid. It has very little action on copper, lead, silver, or mercury at the ordinary temperature, but rapidly attacks tin, zinc, and iron, with evolution of hydrogen and formation of chlorides.

EXPERIMENT 129.—Heat a small quantity of the strong solution; observe that hydrogen chloride is evolved.

When a strong solution is heated, it at first loses hydrogen chloride faster than it loses water; a weak solution under the same conditions loses water faster than it loses hydrogen chloride. In both cases as soon as the liquid contains 20 per cent. of hydrogen chloride, if the heating is continued, water and hydrogen chloride are given off in constant proportions, and the liquid can be distilled under ordinary atmospheric pressure, without any alteration in its composition. The boiling point of the acid of this strength is 110 deg. The commercial concentrated hydrochloric acid contains 36 per cent. of hydrogen chloride, and the strongest solution that can be made at the ordinary temperature and pressure contains 42.6 per cent.

**A Photographic Reading Room and Club at Cheltenham.**—Photographic dealers are enterprising people, and Messrs. Thomas Brothers, of the College Pharmacy, Cheltenham, are proving themselves to be no exception to the general rule. They have, we understand, recently fitted up a complete suite of rooms for the use of amateur photographers. They include a reading and general club-room, provided with all the current photographic publications and works of reference, a well fitted enlarging room, two well appointed dark-rooms, cloak-room, etc. We should say that this club will become a great photographic centre.

## Apparatus.

### GOTZ'S PORTABLE (FEATHERWEIGHT) CAMERA.

THIS camera, of which we give an illustration, is one of the most portable and compact that we are acquainted with, and contains

many novel movements which admirably adapt it to the requirements of all imaginable contingencies. It is capable of very long extension, and yet can be used for a lens of the shortest focus without any fear of the base board cutting off any of the view, as both the front and back of the camera can be freely moved along the base board. This double movement has also the advantage of enabling the weight

of the camera to be kept over the centre of the tripod, the fault of many cameras being that under certain—and those frequent—conditions, the whole of the weight is thrown in front of the tripod. The back swing is from the centre, and the arrangement by which this is secured causes the focussing-screen to come next to the base board when the camera is shut up, so giving it absolute protection. This swing is obtained without the use of the usual fork, and so does away with the guess work in fixing the back of the camera. The back can also be swung horizontally. The lens is fixed on a turntable front, and the front of the camera can be made perpendicular, however the base board may be tilted. Under the base board a large brass ring is attached which fits into the top of the tripod, thus saving much time in searching for the hole for the screw; and it also enables the camera to be turned round with ease, the screw being adjusted so as to hold it sufficiently tightly to prevent accidental turning. The tripod itself is ingenious, and enables the legs to be adapted to unequal ground, being at the same time quite rigid.

Mr. Gotz, 19, Buckingham Street, Strand, also supplies six double film-holders which only occupy the space of three double dark slides. The size of the whole-plate camera when folded is 10 by 10½ by 3½, and the price is £7 10s., or with three slides £10 10s., and aluminium fittings cost £2 extra.

Mr. Gotz has also shown us an aluminium camera, of which the annexed illustration conveys a good idea. It is very light, and possesses even more movements than the "Featherweight," and there are no loose parts, even the screw to attach it to the tripod being fixed to the bottom of the camera. There is a quick shutter working behind the lens, which can be used for either instantaneous or time exposures. The slides are single and very light. The tripod, it will be seen, has a ball and socket head adjusted by the screw, so that the camera can be used at any angle, and for vertical pictures, the camera is pulled right over to the side. The tripod itself is in one piece, caps fitting on the top and bottom when being carried, the bottom cap having a point making it an effective alpenstock. Both cameras can be seen at the offices of this paper.

### A NEW DARK-ROOM LAMP.

In our notice of the apparatus at the Crystal Palace Exhibition we referred to a new lamp which Mr. Slater, of Southampton Street, Camberwell, has just put upon the market. We have now the pleasure of giving an illustration of it. It has red glass on one side and orange on the other, and is made for either oil or gas, the light of both being regulated from the outside. It is so pivotted that a light touch will swing it round, and yet there is no fear of overturning it.

The ventilation of the lamp is good, and by a special arrangement the top can be lifted on leaving the dark-room so as to enable the lamp to cool down a bit. The cost of the lamp is, for oil 13s. 6d., and 2s. 6d. extra for gas; a smaller size is also supplied at 10s. 6d.

### THE "POPULAR" HAND-CAMERA.

Mr. King, of 8, Oakington Road, Elgin Avenue, Paddington, has shown us a model of this camera, which measures only about 7 by 4½ by 10 in. It is fitted with a finder the full size of the plate. It carries twelve ¼-plates in metal sheaths, and the changing is effected by pulling up a lever at the top and returning it to its original position. Fitted with a view-lens the cost is 35s., or if fitted with a rapid rectilinear 50s. The camera is also to be supplied with a small ordinary finder for 25s. Mr. King also showed us an effective portable dark-room lamp, the price of which is 4s.

## Art Colour Photographs

PERHAPS at no time like the present has the subject of photography in natural colours been more prominently before the eyes of the public. It is, however, strange that there are but few persons who can define strictly what it is they mean by the phrase. The common interpretation is that the negative when developed shall bear an image in colours identical with the original.

M. Lippmann's discoveries have already demonstrated that the primary colours can be so photographed on a transparent medium that their values are rendered with a certain accuracy when viewed by *reflected* light. That this, however, leaves much to be desired is evident both with regard to the rendering of individual tints and blends of colour and also in regard to the production of prints.

Whether or not these requirements will ever be satisfied is a matter for conjecture, but it is obvious that if a process can be discovered yielding prints in which the tints and shades of the original are reproduced without arbitrary selection, then it is evident that a vast stride towards the desired goal will have been effected.

This has at last been done by a process now being introduced by the Art Colour Photograph Company, who are exhibiting most charming and artistic colour photographs at the exhibition at the Crystal Palace. The exhibition comprises many specimens, showing the universal applicability of the process. Many excellent portrait studies are shown, notably one of Cardinal Manning taken in full canonicals. There are also copies of standard paintings, tapestries, Persian carpets, etc., in all of which the colours are most beautifully reproduced. As will be seen from our advertisement columns, so many orders have been received at the Crystal Palace that sitters have been informed of the delay that must necessarily arise before the completion of the orders.

We regret to say that we are unable at present to lay the working details before our readers, as we are informed by the Art Colour Photograph Company that their patent negotiations are not sufficiently forward to warrant their disclosing the secrets of the process.

We are, however, at liberty to mention that the principal ele-

ments of the invention consist in the preparation of the sensitised plate (the wet process being used), and also the after treatment of the print.

The first part of the invention, as above mentioned, consists in a further development of the process of ortho- or iso-chromatic photography. The second part of the invention is based upon the results of a series of experiments extending over several years latterly directed more particularly to the establishing of permanency in the prints. The inventors claim that the process will enable photographs of any description to be taken, in which all the tints, tones, and shades of the original are reproduced with absolute fidelity to nature.

With regard to cost, the Company claim that their photographs can be produced at a cost but slightly in advance of the ordinary black and white print, a fact which of itself is sufficient evidence of their further contention that no artistic skill is required in their production. Under these circumstances we may anticipate a brilliant future for these photographs, as it is fair to assume that the public will prefer an artistic photograph in colours such as the Company produces to the ordinary monochrome print.

We understand the Company intends to open studios in London, Paris, and the principal towns in France and England, and that they will be prepared to issue licenses to professionals and others for the use of the process.

We are informed by the Secretary (Mr. Arthur S. Ford) that if any amateurs who have not been able to see the photographs exhibited at the Palace will write to him at his office, Colonial House, Fenchurch Street, E.C., he will make an appointment when they can inspect some specimen prints.

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

THE members of the Leith Amateur Photographic Association have been the first to take the field in this district. A goodly number of them took part in the excursion on Monday, 20th, to Arncliffe, and those who went had every reason to congratulate themselves on their good fortune. Besides the attractions of the locality, which are of no mean order, the day was one of the best this season. The party were taken charge of by one of the estate servants, who directed them where to go. They had a long ramble over the beautiful grounds, and in the course of the day there was "a heavy exposure." I expect the results will be heard of again; perhaps in AMATEUR PHOTOGRAPHER Competitions.

In the early part of last winter Professor Edward Muybridge, of Philadelphia, lectured to the members of the Edinburgh Association of Science and Art, giving them, by lantern, his incomparable series of views illustrating animal locomotion. In recognition of his services to science in connection with his investigations, the association recently awarded him one of their honorary medals, and the Professor has written to the Honorary Secretary a letter in which he says:—"Although I am not conscious of being deserving of this great honour from your society, I am very grateful for its generous appreciation of my efforts to teach the artist the value of a knowledge of the facts of animal movements before he seeks his impression of them from nature. Will you kindly convey to General Sir Robert Murdoch Smith and the members of your society my warmest thanks for the distinguished honour they have conferred upon me?"

**Focussing Screens.**—Mr. E. H. Fitch, of 34, Angell Road, Brixton, S.W., writes us *re* "Celluloid for Focussing Screens:" "I may say that I have been for the last year or more, and still am supplying large quantities of a special celluloid cut for this purpose, which gives great satisfaction both as regards fineness of surface, lightness, and freedom from breakage."

**The Wallasey Guardian** says:—"A delightful reproduction (by the Woodburytype process) of our townsman Mr. T. Mansell's first prize picture "Snow and Hoar Frost, a winter's morning scene in the wooded road on the western slope of Bidston Hill, forms the frontispiece to that dainty magazine the *Photographic Reporter* for April. The view was taken on December 21st, during bright sunlight, between twelve and one o'clock. Besides much technical reading there are some articles attractive to the general reader, a photographic yarn in verse detailing, with much professional humour, how the author belted the world and was rewarded with—twelve marvellous views of Australian fog."

# "Amateur Photographer" Dark-Rooms, 1891.

THE "DARK-ROOMS" kindly placed at our service for the use of amateur photographers are classed as follows:—

*a* Amateur  
*h* Hotel

*d* Dealer or professional.  
*s* Photographic society.

<i>d</i> Aberdeen*	<i>d</i> Deal*	<i>a, d</i> Leeds	<i>d h</i> Ryde, Isle of Wight
<i>d</i> Aberystwith	<i>d</i> Derby	<i>a, d</i> Leicester	<i>a</i> St. Agnes

NOTE.—At the time of going to press we have not received signed authority for the use of "Dark-rooms" marked\*; but they were all placed at our disposal last year, and are doubtless available. — Ed. AM. PHOT

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and *plainly* endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

#### LABELS FOR BOXES OF UNEXPOSED PLATES.

The following list in different languages may prove of service to the tourist; it has been kindly supplied to us by Mr. W. E. Woodbury:—

*English*.—Sensitive photographic plates, which will be quite spoilt if opened in the light. Only to be opened in a totally dark room or by a red light.

*French*.—Plaques photographiques sensibles. Tout détruites par l'exposition à la lumière. Prendre garde de n'ouvrir la boîte que dans une chambre parfaitement obscure.

*German*.—Photographische Tackelplatten Sehr lichtempfindlich Werden ganz verdorben, wenn dem Lichte ausgesetzt Müssen nur in absolut dunkelm Zimmer oder bei rothem Lichte geöffnet werden.

*Spanish*.—Las placas fotograficas sensitivas, que se inutilizan si se las expone al abrirlas, à la luz del dia, se pueden abrir sin inconvenientes en una habitacion enteramente oscura o iluminada por luz roja.

*Portuguese*.—Laminas fotograficas sensitivas. Nao podem ser expostas à luz porque se inutilizam; podendo só ser abertas em camara, escura oce com luz vermelho.

*Dutch*.—Chemisch toebereide photographische platen weke gehue bedorven worden als zy aan de lucus worden blaagteschild. Alleen te openen in eene donkere kamer of by rood licht.

*Italian*.—Piastra fotografiche sensitive che si imperanno affatto si esposte alla luce del giorno. Da aprirsi solo in una stanza affatto buia o dove regni una luce rossa.

*Norwegian*.—Følsomme fotografiske Plader, som fuldstandig fordærvet ved at udsættes for Lysel. Bo'r knn aabnes i et aldeles mørkt Rum eller ved rødt Lys.

*Swedish*.—Sjuskasliga fotografiska plåtar, blifva förstörda om de utsättas för ljus. Fås därför ej öppnas utom i ett absolut mörkt rum.

*Greek*.—Ὅτι ἐν ἀνοδῶν φωτογραφικὰ πλάταις αἰζητὴν δα φθορὰν ἂν ἀνοιχθῶσιν ἐν αὐτῇ φωτὶ. Δέον νὰ ἀνοιχθῶσιν ἐν στυπεννύδωματιαν, ἢ μεφὰς ἐρυθροῦν.

## Notes for Novices.

### PREPARING FOR OUTDOOR WORK.

BEFORE starting out it is always advisable to look over your apparatus and see that everything is ready for use and that you have everything. A very good plan is to set your apparatus and go through all the necessary operations of focussing, and then unlimber your apparatus and as you do so pack it in your case. Be careful that you do not leave your stops, screws, or tripod top behind, nor your focussing cloth. Another very useful adjunct which may or may not come in handy is a ball of good stout string; this may be used on a windy day to tie the focussing cloth down, unless you happen to possess one of Manson's new cloths (see AMATEUR PHOTOGRAPHER, p. 277), which are a perfect boon to a photographer in a high wind. Then again a piece of string tied to the tripod top and ending in a loop reaching within an inch of the ground, placing your foot in this and stretching tight on to the ground, will hold the camera firmer still.

#### VIEW FINDERS.

To the artistic worker, a view finder is almost a necessity. There are various kinds in the market, but the simplest and least expensive is the camera itself. All that is necessary is to unscrew the lens from the flange, place the eye at this aperture, remove the focussing screen and you can then shift your camera about till you see just the bit you want. Then the camera may be swung right round and the lens screwed in and the view examined on the ground-glass. The rules of composition, etc., have been so well laid down in the works of Mr. Robinson, and in the valuable articles now appearing in the pages of the AMATEUR PHOTOGRAPHER, that we shall not attempt any hint in this direction, only remarking that colour should be disregarded and the massing of light and shade only looked to.

### EXPOSURE NOTE BOOKS.

Always keep a record of your exposures, and make sufficient notes to be able to call to mind the actual scene, so that you may determine exactly what to do in developing, whether to increase or decrease contrast, as, notwithstanding Messrs. Hurter and Driffield's generalisations, an enormous power is in the hands of the operator when using pyro or hydroquinone or eikonogen, though there is less power with the two latter reducing agents, and practically none with ferrous oxalate.

### EXPOSURE METERS, ETC.

The question as to whether any table, calculation, or exposure meter is of any value, is always a much disputed point. There are some workers who sneer at such helps, and sneer at those who use them, and this is done because they actually, though not openly perhaps, consider it derogatory to their dignity to condescend to use such aids. This is dignity on a broomstick with a vengeance. They never for one moment think that in mentally referring back to past experiences they use an exposure table. It is utterly absurd to suppose for one moment that a novice can know what exposure to give to a certain subject or any number of subjects in one day; he does not know how to gauge the value of the light, the effect of local and general colour, etc., etc., and therefore surely he may well be pardoned if he makes use of the experience of others, or their tables, to aid him in this respect; and, provided such tables, etc., are used intelligently they are of valuable assistance to the novice and must save a lot of "wasters." Never adhere too slavishly to any table, always mentally refer to past experience, and see whether you cannot recall a somewhat similar subject, and the results you obtained.

Never be in too much of a hurry to expose your plates; it is far better to go home with half your plates exposed than to expose on anything and everything, that is, if you want artistic results. If you merely want to gain experience in developing, etc., then by all means expose all and every plate you have; but unless one's purse and time are both illimitable one soon gets tired of this sort of work.

## Round and About the Clubs.

THE members of the Brixton and Clapham Camera Club held their second competition and exhibition of members' work on Friday and Saturday, the 17th and 18th April, on which occasion between two and three hundred prints were sent in, and the general character of the work was good. On the second evening there was a lantern show and concert, and altogether the affair was a great success. It was made a stipulation that exhibits were to be entirely the work of the exhibitor, and that the pictures winning prizes should become the property of the club. The latter is not a bad idea; it will enable the club to secure a picture gallery which will contain all the best pictures shown at its exhibitions, which will themselves act as landmarks in the progress of photography.

There were five classes: landscape, architecture, instantaneous, portraiture and figure studies, and enlargements; and the judges were Messrs. J. Traill Taylor and A. R. Dresser.

The silver medal for the best picture in the exhibition was worthily secured by Mr. J. A. Butler, by a bromide enlargement, "In Amsterdam," giving a fine view of one of the canals. In landscape, Mr. F. Goldby took the bronze medal with an Obernetter print, "The Grindenwald Glacier," a fine picture, in which the gradation was excellent, running the silver medal picture very closely on all points. Certificates in the same class were also awarded to Mr. F. W. Kent, for a bromide print, "Is She in Sight?" a man standing on the rocks on the seashore looking out for a vessel; and Mr. F. W. Levett for an aristotype print, "A Brief Rest." The bronze medal for architecture went to Mr. F. W. Kent, for a bromide print of "The Norman Tower, Christchurch," which was good, though apparently a little out in the mounting. Mr. F. W. Levett secured the certificate for an aristotype interior, "Ruislip Church," which was an admirable piece of work, all the more creditable because we believe it was his first attempt in that line. In the instantaneous class Mr. W. H. Powell carries off the bronze medal with a print on plain salted paper, "Overbacks," showing a phase of the jump in the game generally known as "leap-frog;" it is very sharp. Mr. J.

W. Coade secures the certificate by a fine view of "Ramsgate Sands," certainly as good a one as we have ever seen. In portraiture and figure study the work was not so good as in other classes, perhaps from lack of opportunity to study and practice that branch of the art. The bronze medal went to Mr. W. Bevins for "The Coastguard," a silver print; the posing was excellent. Certificates were awarded to Mr. E. J. Everett for an albumen print, "A Group of Sailors," and to Mr. A. B. Wilkinson for a similar print, "At Work." In enlargements we have already mentioned the winner of the first prize. The certificate was awarded to Mr. F. W. Kent for "A Stormy Day," which made a fine picture. Amongst the pictures which did not secure awards but are worthy of notice, there were a fine enlargement by Mr. F. W. Levett, showing two horses and mowing machine; a set of four views, "After the Storm," "A Rough Day," "The Quay," and "The Shallows," the latter having splendid clouds, by Mr. F. W. Kent; a bromide print of "Torquay," by Mr. J. W. Coade; a very pretty river scene, "Near Isleworth," by Mr. W. Bevins; and three interiors by Dr. Reynolds, one of which was particularly good.

There was a class for lantern-slides, the judges being Messrs. A. Pringle, H. Starnes, and A. R. Dresser. The silver medal given by the President (Mr. A. R. Dresser), for the best set of six slides, was awarded to Mr. F. Goldby, and the certificate to Mr. J. A. Butler.

## Thursday Evenings at the Camera Club.

(BY ONE OF OUR STAFF.)

On Thursday, April 23rd, Mr. Frank Howard read a paper entitled "Amongst Bye-paths and Field-lanes with the Camera." Sir George Prescott occupied the chair.

Previous to the lecture Dr. Patterson showed some binding strips for lantern slides which he said would stick. They were produced by Schweitzer, of New York.

Mr. Howard in his paper dwelt on the charm of wandering amongst the beauties of the country and studying with and without the camera the picturesqueness of rustic people and rural scenes. He gave a few hints as to the most probable way of dropping upon the out-of-the-world picturesqueness which was so fast disappearing. The lecture was illustrated a number of slides.

After a vote of thanks to Mr. Howard had been passed by acclamation, slides were shown by Messrs. Austin, Bright, Gale, Hussey, Patterson, and Seyd.

On Thursday, May 7th, Mr. Willis will give a paper entitled "Clam-Chowder."

## Exhibitions.

### CRYSTAL PALACE EXHIBITION.

THE work shown in the art division, as was to be expected, was of varied value, but some of it was as good as could be desired. Care and thought have been displayed in the great majority of the exhibits, and considerable taste shown in both the mounting and framing of the pictures. As there were over eleven hundred catalogued exhibits, it is evident that we cannot deal with them all, and in the few notes we propose to give we shall, therefore, confine ourselves to those which secured awards at the hands of the judges:—Messrs. Frank Atkinson, Valentine Blanchard, F. P. Cembrano, F. Mason Good, Frank Howard, and Philip H. Newman.

Dealing with the Professional class first, we find that the

#### GOLD MEDAL

for the best alcove was awarded to Van der Weyde, of Regent Street; the alcove contained eleven pictures, all of which, with the exception of a frame of panel platinotypes, were enlargements. Two of these—"The Death of Cleopatra" and "Mark Antony"—were life-size, and "Mrs. Langtry, as Cleopatra" reclining on a couch, was but little smaller. The pictures, however, which showed the most delicate work were those of Minnie Terry, Miss Edith Chester, and a coloured photograph of Lady Mary Hatzfeldt.

### THE SILVER MEDAL

for the best screen went to Mr. W. Winter, of Derby, who showed some splendid work, two sepia platinotypes, "An Authoress" and "Ice Queen," being particularly striking, and the portraits of Mrs. Clarkson and the Misses Hewson were of almost equal merit.

#### BRONZE MEDALS.

*Pure Landscape.*—R. Keene, Derby, for a frame of platinotypes of "Derbyshire Dales" (689), showing artistic selection and careful treatment.

*Landscape with Figure.*—R. H. Lord, Cambridge (990), "An Idle Moment," a useful study telling its own tale. It shows two horses standing at the plough, the driver leaning on the handles and talking to a girl who has been gathering firewood.

*Architecture.*—F. W. Edwards, 87, Bellenden Road, Peckham, (578), a fine direct picture of the "Houses of Parliament," in a warm tone, which is very effective. C. Whiting, 44, Denmark Road, Ealing Dean (740), a view of the "Crypt of Canterbury Cathedral," which recently took a prize at the West London Photographic Society Exhibition. Lala Deen Layal, Indore, Central India (992), a fine series of pictures of the "Dilwara Temples, Mount Abu."

*Clouds.*—A. Swan Watson, Edinburgh (1,000 and 1,002), two splendid frames, one containing six gelatino-chloride photographs and the other six platinum prints of "Sunset Studies;" they are as fine cloud studies as we have seen in any competition.

*Flashlight Pictures.*—John Collier, Birmingham (1,100), a good series of full-length portraits.

*Genre Subjects.*—W. M. Malby, Chichester (1,107), a frame as full as possible of prints, which overlapped each other, and generally conveyed the idea of much crowding, spoiling the effect of otherwise good work, four large heads being specially good.

*Photo-mechanical Pictures.*—W. L. Colls, Barnes (1,106), six photo-etchings, done in Mr. Colls's best style, about which we need say nothing.

*Dry Point Series.*—H. Flather, Queen's Road, S.E. (970 and series), a number of prints showing the various stages in the process of "dry point" or "needle" finishing, a most effective process for portraits, as shown in the examples hung.

*Reproductions.*—S. B. Bolas and Co., Ludgate Hill (951 and series), a number of phototype reproductions in various colours, the most striking, perhaps, being a reproduction, in blue tint, of Turner's "Rain, Wind, and Storm."

*Portraiture.*—The work of W. Crooke, Princess Street, Edinburgh, was considered by the judges to be good that a special gold medal was awarded to him (102 and series); amongst the more striking of the portraits were those of M. Paderewski, Colonel Leslie, the Lord Advocate, and a number of the Lords Justices of Scotland.

*The Challenge Cup.*—The exhibit of the Birmingham Photographic Society again secured the cup by a magnificent show of work, although the exhibit of the West London Society was but little inferior. It is a curious fact that there is only one individual prize taken in the Birmingham Society, while there are three in the West London Society. Of course, we do not mean to say that the number of prize-takers in the society should weigh with the judges, but the coincidence gives rise to many reflections, as to individual and average ability, and other questions of a like nature.

Coming now to the Amateurs, we find that

#### THE SILVER MEDAL,

for ladies, was awarded to Miss Lil Tomkinson, Liverpool, whose name, unfortunately, is not in the catalogue. The pictures were "The Little Old Woman who had so many Children she didn't know what to do," is a picture of a little girl surrounded by dozens of dolls; the child's face wears a perplexed look, and one can easily imagine she did not know what to do with her dollies; four pretty platinotypes—"Stepping-stones," "In the Dale, Bromborough," "Banqueting Hall, Haddon Hall," and "Roby Mere."

#### BRONZE MEDALS.

*Pure Landscape.*—J. A. Hodges, Chancery Lane (732), "Near Brendon," a charming warm platinum print, in which the gradations are excellent, and the general effect of the picture was most artistic. B. Karleese, Birmingham (532 and series),

fifteen views of Warwickshire scenery, and on the whole making pretty pictures and showing careful work.

*Landscape with Figure.*—The Rev. Precentor Mann, Bristol (410 and series), a series of beautiful prints of Old Normandy, interesting in themselves, historically, and also for the admirable workmanship. J. E. Austin, West Court, Detling, Maidstone (442 and series), some of Mr. Austin's Whitby studies, which we have so often commented upon that we need not again point out the excellencies of the work.

*Architecture.*—C. Court Cole, Oxford (1,139 and series), three fine pictures excellently selected—All Soul's College Chapel; Library, Queen's College; and Divinity Chapel, all at Oxford.

INSTANTANEOUS, INCLUDING MARINE SUBJECTS.

A. R. Dresser, Bexley Heath, Kent (1,071 and series), four bromide enlargements of Mr. Dresser's well-known Jersey sea pictures, giving evidence of careful work.

*Animals and Birds.*—Karl Greger, 17, Gordon Street, Islington (852), six sepia platinotype pictures of farm life, of excellent composition and careful printing, making a charming set—"In the Highlands," "Home from the Pastures," "Waiting at the Farmstead," "Evening," "Close of the Day," and "Surrey Meadow."

*Home Portraiture.*—J. H. Pickard, Birmingham (497), "A Bunch of Grapes," a fine bromide enlargement, showing careful printing and development with very fine gradations, the relative values being good.

#### FOR ENTIRE EXHIBIT.

H. Selby, 42, Ladbroke Grove Road, W., a series of half-plate platinotypes, containing several very charming pictures in delicate tones, and representing a wide range of subjects—"Twilight," "A Rock-bound Coast," "A Relic of the Past," "The Shades of Night," "The Dawn of Day," "The Distant Sea," "A Grey Morning," and "The Silent Highway." "The Distant Sea" made a striking picture, showing a view to the sea across a cornfield.

#### SCIENTIFIC PHOTOGRAPHS.

*Bronze Medal.*—A. F. Stanley, Kent, Physiological Laboratory, Oxford (478), eight photo-micrographs.

#### TRANSPARENCIES.

*Bronze Medal* (Professional).—F. W. Edwards, Peckham (1,165, 1,166).

Alcove 4 R was a very interesting one, as it contained a large number of pictures taken by the late Mrs. Julia Cameron, including portraits of Professor Jowett, Carlyle, Sir John Herschell, and Dr. Joachim, Tennyson, Browning, Darwin, and Sir Coutts Lindsay. Messrs. Cameron and Smith, of Mortimer Street, W., showed some fine etchings and portraits, including one on porcelain of Mary Anderson.

In Alcove 9 R, Mr. Alexander Ayton, Edinburgh, has a striking carbon enlargement on opal, "Sweet Sixteen," and a fine group, "Cousins," containing eleven children.

In Alcove 1 L, Messrs. Poulton and Son, Lee, show some excellent views of Whitby, Mentone, Monte Carlo, Cannes, and Algiers, those of Monte Carlo including views of the interior of the *salle de jeu*, and the theatre, which, we understand, have never before been photographed.

Mr. Wollaston has been single-handed this year in making the arrangements for the show, and we must congratulate him upon his success and upon the general success of the Exhibition, notwithstanding the fact that the larger apparatus manufacturers held aloof. We would like, however, to make one suggestion to him of the next occasion. It would be for the general convenience, not only of photographers, but of the public, if after the letters indicating the various classes the subject itself were placed, for after all class A P or A C is, to say the least of it, rather vague. Beyond this, however, we do not know that there is anything we can suggest in the way of alteration for the next Exhibition, which it is to be hoped will not be boycotted by anyone.

#### GLOUCESTER PHOTOGRAPHIC EXHIBITION.

The Triennial Exhibition of the Gloucester Photographic Society was opened in the Assembly Rooms, Gloucester, on April 20th and closed on the 30th. The room is well adapted for the purpose of an exhibition, as it is entirely lighted from the top, thus giving plenty of light and wall space.

On a first glance it looked very like a smaller edition of

Liverpool (we believe no less than forty of the Liverpool exhibitors showed here).

The principal exhibit (not for competition) was undoubtedly the celebrated series of "Artists at Home," by Ralph W. Robinson, and also the "Animal Studies" of Hedges and Sons, Lytham. Mr. H. P. Robinson also showed some of his well-known studies.

To particularise: In Class I.—Portraits, Professional—the medals were allotted to W. J. Byrne and W. W. Winter, the portrait of Miss Terry, by Window and Groves, running the winners very close.

Class 2, Portraits, Amateur. Winners: Shapoor N. Bhedwar and W. J. Jenkins, the latter a local man; Shapoor N. Bhedwar's portraits of Mrs. Fitzgerald and Miss Barrington being very fine. This class also included "Harmony," by J. E. Austin, and "My Sister," by W. Smedley.

Class 3—Landscape, Professional—was an excellent one. We especially noticed "A Misty Morning," by A. Hendrey; "The Road to the Mill," by J. P. Gibson; "Dinner Time," by A. Durn; and "Sunset on the Don," by F. Whaley. In the latter, however, the sun was badly stopped out.

Class 4, Landscape, Amateur, under 8½ by 6½. Medals: Karl Greger, Martin J. Harding. An "Old Welsh Bridge, Winter," by A. W. Gottlieb, was a lovely little study.

Class 5—Landscape, Amateur, 8½ by 6½ and above—was a strong one. Medals: J. E. Austin, E. Lloyd Edwards, and W. H. Banks. Austin's "By the Tow-path" and "The Road by the Sea" were easily first. "A Cumberland Lane," by A. Huddart; "Sunset at the Old Mill," by J. Gale; "On Babbacombe Beach," by W. C. Beetham; "Watcombe Bay," by T. M. Brownrigg, were all noticeable. "A Wild March Morning," by E. Lloyd Edwards, well deserved the extra medal allotted to it.

Class 6, Instantaneous. Here the prominent features were the studies of "The Smoky Tyne," by Lyddell Sawyer. "A Study of Pigeons," by Charles Reid, was remarkably good. In our opinion "Clovelly Harbour," by W. C. Beetham, deserved some recognition by the judges.

Class 7, Hand-camera Work, contained no new feature of interest.

Class 8, Architecture under 8½ by 6½. The winners were E. Beck and C. Court Cole.

Class 9, Architecture, 8½ by 6½ and above. This class contained R. Keene's well-known Derbyshire interiors, but which did not receive a reward. "Prior Rowland Lechmann's Shrine," by J. P. Gibson, "Lilleshall Abbey," by J. Gale, were good. The marble pillars in "Midland Hotel, Bradford," T. Scottow, were admirably rendered.

Class 10, Genre or Figure. A good class. 1st, Lyddell Sawyer, extra silver medal, Shapoor N. Bhedwar; bronze medal, R. H. Lord. We noticed "What does it Weigh?" T. Glazebrook, "An Idle Moment," and "Work and Play," R. H. Lord.

Class 11, Enlargements (Amateur).—Here F. W. Worsley Benison was easily first, Messrs. Kitchen and Huson taking the other awards. "Winter," by J. E. Austin, was very good.

The lantern slides we did not see.

Class 15, Scientific. This was the only class in which we were unable to agree with the judges, the award going to "Views from a Balloon," by Cecil V. Shadbolt; in our opinion it should have gone to A. W. Gottlieb, for "A Bunch of Grapes," which was by far the greatest novelty in the Exhibition, the technical work being perfect, on Alpha paper, toned to the richest purple, and showing the bloom on every grape.

Class 16, Collection of photographs by members of the Society, contained good work by Messrs. Beetham, Hodges, Pitcher, etc.

We are afraid that the general public have scarcely patronised the Exhibition to the extent it deserved. We ought also to mention that a lantern exhibition was held each evening, the first one being given by Mr. Paul Lange, of Liverpool, with his Iceland views.

We heard casually that the Gloucester Society were thinking of taking up the survey of their ancient city. We sincerely hope that this is true, as they have a field in which to work that is second to none in the country.

Concerning the claim that the first photograph of a flash of lightning was made by an Englishman named Jarman, in 1877, a correspondent of the *Photo. Archiv* points out that the same thing was done some fifteen years before, and quotes from Heinlein's "Photographicon" (Leipzig, 1864), p. 380.

## Quarterly Examinations in Photography.

**Question 7.**—What is the meaning of the terms *isochromatic* and *orthochromatic*, and which is correct? State the theory involved in *orthochromatic* photography.

**ANSWER.**—Neither *isochromatic* nor *orthochromatic* is a correct expression. One means "equally coloured," the other "rightly coloured." To be correct, it should be some word meaning "rightly translated," i.e., the colours in nature are "rightly translated" into monochrome. I should say *orthochromatic* was the least incorrect of the two.

The theory of *orthochromatic* photography is that the intensities of colour, acting chemically on a sensitive film, should be made the same as when they act visually on the retina of our eyes. The difference of these intensities is well shown in a table in last week's *AMATEUR PHOTOGRAPHER*. This can now be accomplished by a combination of two methods. Soaking the plate in such chemicals as cyanin when sensitiveness to red, or erythrosine when sensitiveness to yellow and green is needed, will considerably increase the chemical energy of these colours on the sensitive surface. Whether these agents act physically or chemically is as yet a moot point, Eder supposing that the vibrations are absorbed by the coloured compounds, and do the work of photographic decomposition, Abney holding that the colouring agent undergoes photographic chemical decomposition in the region of absorption, and that agents are created which act on the silver haloid.

However they act, these dyes only do half the work, i.e., they increase the sensitiveness of the plate to the less active (chemically) rays of the spectrum, but they do not diminish the activity of the blue and violet rays, and this latter part of the work is done with coloured screens.

R. C. M.

**Question 8**—What is the action of a mixture of *bichromate* of potash, *hydrochloric acid*, and *water* on a *dry-plate* before exposure, after exposure, and after development and fixing.

**ANSWER.**—Before Exposure. Being unable to find anything in the different text-books, I carried out a series of experiments, with the result that I could not find any difference, except that the plates were much slower and gave strong contrasts suitable for mechanical work.

After Exposure. The latent image is destroyed and the plate is resensitised, but is very slow, as mentioned above.

After Development and Fixing. The image on the plate being now metallic silver, is attacked by the mixture and bleached, i.e., is converted into chloride of silver, but can be printed out or developed after a short exposure and toned. This process is sometimes adopted for toning lantern slides and prints produced from a bromide emulsion.

S. N.

**Question 9.**—Define the terms *stop*, *diaphragm*,  $f/8$ , *U. S. No. 2*; and give Dallmeyer's system of numbering the aperture of diaphragms.

**ANSWER.**—*Stop*. A disc (usually of metal) with a central aperture of such a size as to allow the rays of light to pass only through that portion of the lens that it has been determined to use. A stop must therefore be placed close to the lens.

*Diaphragm*. Is similar to a stop, but is placed some distance from the lens, and its object is not to reduce the size of the lens, but to transmit only those rays that are parallel to the axis of the lens. The diaphragm is usually placed in a single lens about one-fourth to one-seventh of the focal length off, and in a doublet at the optical centre.

$f/8$ . This is the usual way of numbering diaphragms, and means a diaphragm with an aperture the diameter of which is one-eighth of the focal length. Note, the area of circle varies as the square of the diameter, hence in making comparisons it is necessary to square the  $f$  number.

*U. S. No. 2*. This means a diaphragm the area of which is twice that fixed by the P. S. of G. B.  $f/4$  as the uniform standard, that is twice  $4^2 = 32$ , taking the square root of which gives us  $f/5.656$ .

Dallmeyer's system is similar to the U. S., only he takes as a standard  $f/\sqrt{10}$ , i.e., about  $f/3.1623$ , and the advantage claimed is that it enables a decimal system to be used. His stops are numbered from 5 to 500.

S. N.

**Naming Photographs.**—Mr. A. Gray, of 44, Snow Hill, London, E.C., has just brought out a patent apparatus or machine for printing in white letters the title upon a photographic print. This little invention is issued with the title "Name It," and will be found of considerable service to both the amateur and professional. Prices and fuller particulars can be had of the inventor.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the *PHOTOGRAPHIC REPORTER*, and the Editor of the *REPORTER* will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Ashton.**—The first meeting of this society in its new home at Henry Square took place on Thursday evening. The object of the gathering was for the purpose of giving to beginners an idea of the different methods adopted in the development of plates in photography. The following is a list of names of the gentlemen who were developing and the various chemicals which they were using:—Mr. Glazebrook with hydroquinone, Mr. Redfern with eikonogen, Mr. Greenwood with eiko-cum-hydro, Mr. W. Chadwick with ferrous-oxalate, Mr. J. W. Kenworthy with pyro and ammonia. The Chairman announced that the rooms would be open daily, and that a dark-room was about to be fitted up for the convenience of the members. Every Thursday night, he added, would be set apart as a club night for different members to compare notes.

**Birmingham (New Club).**—At a meeting held at the Colonnade Hotel, New Street, on the 22nd ult., it was resolved that a photographic club or society be formed, and a Provisional Committee consisting of Dr. Leech (Chairman), Dr. Hall Edwards, E. Morton, C. R. Lunn, Dr. Maberley, and Walter D. Welford (Hon. Secretary), was appointed to draft out a code of rules and make the necessary general arrangements, to be placed before a general meeting for adoption, to be called at an early date. The idea of the Provisional Committee is that the name should be "The Midland Camera Club." It is proposed that the work of the club be divided into the following sections: Scientific, Archaeological, Lantern, Cycling and Touring, Ladies', and Instruction of Beginners. Each section to hold their own meetings, and appoint their own officials. General meetings will be held monthly, probably on Tuesday or Friday nights. The Committee think that much detail work could be done by the sections, leaving the general meetings free for lectures, lantern exhibitions, etc., and in this respect the new club will go outside its ranks to other societies, and thus promote friendly intercourse. Club-rooms have already been secured in a central part of the town—one a fair size for meetings, with two smaller ones attached for dark-rooms. For lectures and exhibitions a large hall, holding 200 to 300, will also be at their service. About thirty gentlemen have signified their desire to join.

**Birmingham.**—At the ordinary meeting on the 23rd ult., Mr. G. T. Lyndon in the chair, there were fifty-eight members present. The Chairman congratulated the Society on again winning the national silver challenge cup, and then called upon Mr. W. J. Harrison, F.G.S., for his paper and demonstration on "Instantaneous Photography." Mr. Harrison announced that Dr. Norris's new dry collodion plate would be on the market about midsummer. A new factory was being built for its manufacture at Stechford. He explained the working of Decoudun's exposure meter and Messrs. Hurter and Driffeld's, which he had used with success for twelve months. Watkin's exposure meter was also shown. Warnerke's sensitometer was exhibited and explained, with examples which had been tested. In working he preferred to take Place's and Underwood's shutters for use instead of using a cap for lens. He advised members to use boiled distilled water when making up their developing solutions, and not to hurry development. If a plate is over-exposed it should be first soaked in a weak bath of potassium bromide, and if under-exposed a soaking in very dilute ammonia is beneficial. Latitude of plates, he said, was often over-rated, and there is generally greater latitude for over-exposure than for under. After some further remarks Mr. Harrison developed half a dozen plates he had exposed with a hand-camera that day in the streets of Birmingham, the whole of them coming up wonderfully well, the developers used being Thomas's hydroquinone, pyro, and ferrous oxalate, as put up in their travelling cases. He then took several flash-light pictures of the company present.

**Bristol.**—The April meeting of the amateur photographic association was held on the 10th ult. The question of sending in contributions for the circulating portfolio, mounted or unmounted, was raised by Mr. Hutchinson, who said that members seemed to be in doubt. It was suggested that in view of the different destinies of particular prints contributed, as, e.g., their retention by the Council for hanging, or for the Association's album, or their return to members contributing them, etc., that it would be better if prints were contributed unmounted, with their corners only held, by being slipped into slots in a card support. It was ultimately decided to refer the question to a committee to be called upon before the end of the month, who should finally settle it. The President drew particular attention to the appeal made in the circular notice of this meeting, to members, asking them to contribute specimens of their work to decorate the walls of the Club. He felt it would be only a

fair return for the kindness that the Club Committee had in many ways shown the Association. The limelight was then turned on, and the Association lantern brought into requisition for the purpose of exhibiting slides made by members of the Association. A large number of slides were shown, including some very good work indeed. Amongst those exhibited were slides by Messrs. Brightman, Norgrove, Davey, Stephens, Lavington, Bond, Butler, Miller, and Hayman. Mr. Duncombe, jun., assisted with the lantern, which gave a very effective light. Some professional slides of Derbyshire views were also shown, and the exhibition was on the whole very successful both in the quantity and the quality of the work brought by members.

**Croydon.**—At the ordinary meeting on the 27th ult. the President, Mr. Maclean, in the chair, Mr. H. J. Burton, assisted by Mr. A. Braham, gave an able and attractive demonstration of the "Carbon Printing Processes." Among the advantages claimed for this well-known but little used means of printing are its permanency and the power of obtaining prints in a large range of colours, including engraving black, brown, sepia, red chalk, and greenish blue. The demonstrators deftly illustrated the various manipulations, including squeezing the exposed print on to the single support, stripping the back of the tissue from the support, developing the latent image with water at 100° F., rinsing and soaking in alum bath. Opals were also operated upon; and the production of prints by what is known as "double transfer" shown. In connection with the discourse Mr. Burton showed an actinometer of his design, exceedingly useful for not only carbon printing but other occasions where the actinic power of the light requires to be gauged. The President expressed wonder that so few amateurs had tried the carbon process, having regard to the charming results which are so easily attainable. Mr. Charles Hussey said that although in the course of a long experience he had attended numerous demonstrations he had never been more interested than he had that night; he strongly recommended the process for portraiture, and had found the film of great value for transparency work (collodio-bromide). This meeting concludes the ordinary fortnightly gatherings held during the autumn, winter, and spring, and the summer excursion fixtures were inaugurated on Saturday, April 25th, by a trip to Dorking. The following excursions were announced: May 2nd, Leatherhead (by Mr. Maxey); May 9th, Merstham (by Mr. Maclean); May 16th, Mitcham (by Mr. Blow); May 23rd, East Grinstead (by Mr. Cheshire).

**East London.**—This newly formed Society last week held a special general meeting (Mr. E. Stone presiding), when the rules and bye-laws were submitted and approved, arrangements for the ensuing season were announced, and outings fixed for the first Saturday and third Thursday in each month. Special competitions are also being arranged in various subjects, and the Society is making rapid progress. The meeting nights are first and third Mondays in the month, at the coffee-room "London Apprentice," 333, Old Street, E.C. Particulars of membership and any information will be given by the Hon. Secretary, H. G. Wallis, 84, Shore-ditch, E.

**Faversham.**—The annual general meeting of the members of this Society was held on the 21st ult., Dr. C. J. Evers (Vice-President) in the chair. The Chairman alluded to the gratifying quantity and quality of the members' work sent in for the first annual competition, comprising 99 landscapes, 32 figure studies, 24 architectural, 10 instantaneous, 10 opalines, 76 lantern slides, making a total of 251. These photographs, together with other photographic work, including a splendid collection of prints lent by the Editor of the AMATEUR PHOTOGRAPHER, were on view to the public at the Minor Hall of the Faversham Institute, on April 28th, 29th, 30th, and May 1st, and in connection with the exhibition there was an entertainment of dissolving views given in the Lecture Hall, in aid of the Institute Exits Fund; subject, "The AMATEUR PHOTOGRAPHER Prize Slides, 1890." The report and accounts having been passed, Lord Throwley was re-elected President; Dr. C. J. Evers, Mr. W. C. Stunt, and Captain C. F. Hooper were elected Vice-Presidents; whilst the following members were chosen to form the Committee, viz., Messrs. C. Cremer, F. Crosoer, A. N. Filmer, F. C. Jackman, M. Laxon, and C. H. Semark. Mr. Percy Dan consented to take the office of Hon. Secretary. The results of the photographic competition, as adjudicated by Mr. T. Barns, were as follows:—Special prize from Lord Throwley for best print in the competition, awarded to W. C. Stunt, for opaline entitled "Waverley Lodge." Special prize from Mr. W. C. Stunt for best lantern slide in the competition awarded to Dr. C. J. Evers for slide entitled "A Gloucestershire Valley." Class 1, Landscape (three best prints under one motto): 1st, W. C. Stunt, (1) Pigeon-house, (2) Bridge on the Fill, (3) On Tilford Green; 2nd, C. Cremer, (1) Old Palace, Charing, (2) Sharsted Walk, (3) Painters' Forstal; V.H.C., For Bridge over Fill; H.C., F. Crosoer, for Thames Views; H.C., Captain Hooper, for "The Carriage is Ready." Class 2, Instantaneous (three best prints): 1st, Dr. Evers, Nos. 3, 5, 1, Rough Sea at Herne Bay; 2nd, H. Dan, (1) The Start, (2) Pea-picking, (3) Off Sheerness. Class 3, Architectural (three best prints): 1st, Dr. Evers, (1) Gloucester Cathedral, Interior, (2) Ditto South

Porch, (3) Ditto Interior, the Organ; 2nd, M. Laxon, (1) Ospringe Church, (2) Selling Church, (3) Queen's Court; H.C., C. Cremer Palace Gate and Lenham Church; Class 4, Figure Studies (three best prints): 1st, F. Crosoer, (1) A Stile at Sharsted, (2) The Photographer Photographed, (3) In Eastwell Churchyard; 2nd, C. Cremer, (1) Now, All Still, (2) In Charge, (3) Counsel; Class 5, Opalines (three best prints): 1st, W. C. Stunt, (1) Waverley Lodge, (2) A Creek, (3) The Organ; 2nd, H. Dan, (1) Whitehill Stream, (2) Medway at Maidstone, (3) Church Road in Snow; Class 7, Lantern Slides (the best set): 1st, F. Crosoer, set No. 1, eight slides, Thames at Sonning, Itfley Mill, Park Place Boathouse, Sunbury, Sandford Mill, Drinking Fountain, Nuneham Boathouse, and Otterden Woods; 2nd, Dr. Evers, set No. 1, eight slides, A Gloucestershire Valley, Court House, Painswick, In Castle Grounds, Adley, South Porch, Gloucester Cathedral, Hoar Frost, Naboth's Vineyards, Surf, Herne Bay, Pier, Herne Bay; H.C., Oare Creek, and Interior Gloucester Cathedral; H.C., Interior, Boulogne Cathedral.

**Glasgow and West of Scotland.**—The closing monthly meeting for the session of this Association was held on the 20th ult., Mr. John Morison, jun., President, in the chair. Five new members were elected. The President gave a report on the International Photographic Exhibition to be held in the Fine Art Institute in September. Mr. John Stuart, Buchanan Street, showed his system of taking photographs by means of the flash light. He also exhibited some very beautiful work done by this means. Mr. Stuart then photographed five of the members of council in a group, and the negative was developed and shown to the meeting. The meeting closed with the usual display of lantern slides by members. An outdoor meeting was held on the 18th ult., which was eminently successful. Fifteen members turned up and travelled by train to Ayr, where a brake was in readiness to convey them to Dunure and Maybole. Some excellent negatives were secured, and a number of lantern slides from same shown at the monthly meeting.

**Hackney.**—The ordinary meeting was held on the 23rd ult., Mr. J. O. Grant presiding. Various books were announced as having been presented to the library, which bids fair towards becoming a useful auxiliary to the Society. The Hon. Secretary showed a compact little hand-camera, called Itakit, made by Messrs. Matthews, of Birmingham. It is made to take twenty-four plates, lantern size, and was thought very fair at the price. Mr. Grant showed some work on Fry's naturalistic paper. The Chairman then called on Mr. J. A. Sinclair for his paper and demonstration on "Lantern Slide Making." After mentioning the different methods of slide making, Mr. Sinclair proceeded to expose some Ilford, Alpha, and ordinary lantern plates with success, the burners used being the ordinary seven burners of the hall, and consequently difficult to judge by. Various questions were asked incidentally. Mr. Sinclair afterwards toned the Alpha paper, which was shown at different stages of toning (wet) through the lantern. After the demonstration, slides were put through, the work of Messrs. Grant, Funston, W. Fenton Jones, Rider, Gerard Smith, Herbert Smith, E. H. Jones, Hasdell, Hull, Beckett, and others. Messrs. Mawson and Swan also sent their prize set.

**Holborn.**—The monthly lantern evening was held on the 24th ult., when Mr. T. O. Dear (Vice-President) presided over a large attendance of members. A number of slides of the Paris Exhibition, lent by Mr. Merne, were passed through the lantern, followed by some from Messrs. Mawson and Swan, showing the various colours, ranging from red to black, obtainable on their lantern plates. Slides by Messrs. Chang, Elsworth, Gay, Miller, and Thompson, members of the Club, were also shown. The prize for the best "group" taken at the last club outing (presented by Mr. Brocas) was awarded to Mr. Dear, who announced that he would give a similar prize for the best "group" taken at the outing to Pinner on the 9th of May.

**Huddersfield.**—On the 21st ult., the above society held its second annual exhibition of work. The number of prints shown was not large, but of good quality. Messrs. Young, Charlesworth, and the Secretary showed some 150 stereoscopic transparencies. A new feature as compared with the last exhibition was a show of apparatus, the trade being well represented by Mr. W. F. Piggott and Mr. F. N. Heath. We are glad to notice that a number of stereoscopic cameras were exhibited. Several specimens of home-made cameras, shutters, etc., were shown by members. A lantern exhibition was also given. Slides were shown by Messrs. Mellor, Madden, Crook, and Dean. A series of views, chiefly instantaneous, of yachts, were shown by Messrs. S. Priestly and Son, of Egremont, Cheshire, who recently took the silver medal at the Liverpool Exhibition for that class of work, which were greatly appreciated by all present. The exhibition was a decided success, the rooms being crowded all the evening.

**Ireland.**—The usual monthly technical meeting was held on the 23rd of April, Prof. J. Alfred Scott, M.B., Vice-President, in the chair. After the usual business had been disposed of, the Boston Camera Club Slides—"Illustrated Boston"—were put through the lantern, and were appreciated by those present. The following

members also contributed slides: Messrs. Hargrave, Inglis, Ruthven, and Mathews.

**Leeds.**—On the 20th ult. a paper on "Bromide Printing and Enlarging" was read by the Hon. Sec. (Mr. S. A. Warburton). In the absence of the President the chair was occupied by Mr. J. W. Refitt. In introducing his subject Mr. Warburton pointed out the advantages of the bromide process, the chief of which were that the process can be worked independent of daylight, the rapidity with which prints can be produced, and the close resemblance that a good bromide print has to a platinotype picture. In describing the manipulation of the process the various classes of paper in the market were referred to, the "slow rough surface" being the one which seemed to yield the best results. The great secret of obtaining pure whites in the prints was a liberal use of the acid solution after fixing, and for this a one per cent. solution of sulphuric acid was the best. A method of printing in skies from cloud negatives was explained and illustrated. In dealing with the subject of enlarging, the kind of apparatus for use both with daylight and artificial light was described, the former giving by far the best results and being less expensive to construct; indeed, any amateur at a cost of a very few shillings could make one for himself. A number of enlargements and bromide contact prints were exhibited, as were also the enlarging apparatus for use with daylight and artificial light, and in conclusion Mr. Warburton developed before his audience a fine enlargement made on Ilford slow, rough-surface paper. At the conclusion of the paper an interesting discussion followed.

**Newcastle-on-Tyne.**—At the ordinary meeting on the 21st of April, Mr. J. P. Gibson in the chair, arrangements were made for a series of competitions confined to amateur members of the association (particulars of which will be announced shortly), and for five outdoor meetings during the season, which are as follows, viz.: Ripon and Studley, Seaton Sluice and district, Bellingham, Wooler, and Stocksfield. Mr. J. Hedley Robinson read a paper on "Carbon Printing," and practically demonstrated the process.

**North Middlesex.**—On the 25th ult. a number of the members took part in the field-day, as arranged, and proceeded to Edgware. On the 27th ult., Mr. F. L. Pither in the chair, Messrs. Marion and Co.'s representative, Mr. Dickenson, exhibited and explained the action of the Radial hand-camera, and showed samples of Eikenogen cartridges, which were distributed among the members. Messrs. Goodhead and Cox reported that they had tested the plates sent by Messrs. Marion and Co., which they had found of good quality, as shown by the prints exhibited. Mr. Taylor showed prints on the chloride of silver emulsion paper sent by Mr. O. Scholz, and said he had found it easy to work, great variety in the tone being obtained. A special meeting was then held, to elect a President in the place of Mr. Humphries, resigned. Mr. J. W. Marchant was elected by a large majority.

**Paisley.**—The annual meeting took place on the 23rd ult. Mr. James Donald, jun., occupied the chair. The Secretary's report showed that ten members had joined the Society during the year. Outdoor excursions had taken place during the summer months to Bridge of Weir, Port Glasgow, Castletemple, Gourrock, the R.N.Y.C. Regatta at Rothesay, and Hawkhead. The Treasurer reported that a balance of £5 was on hand. The following office-bearers were elected for the ensuing year: Hon. Presidents, Messrs. H. H. Smiley and Stewart Clark; Hon. Vice-Presidents, Messrs. R. Harris, James Donald, jun., and James Barr; President, Mr. Matthew Morrison; Treasurer, Mr. Robert D. Caldwell; Secretary, Mr. David B. Jack, Glencairn, Blackhall; Council, Messrs. Robert Ferrier, Alexander Kilpatrick, Alexander Gardiner, jun., A. F. McCallum, and Thomas H. Taylor; Lantern section, Messrs. Thomas Rastall, A. Kilpatrick, and T. H. Taylor.

**Putney.**—A highly interesting and instructive lecture and demonstration on "Alpha Paper" was given on the 25th ult. by Mr. Howson. Several other short practical demonstrations by the members followed. Mr. Faulkner having exhibited an ingenious piece of home-made apparatus for printing papers and plates, by its aid printed and developed with pyro an excellent half-plate transparency on ground glass, describing the process to the uninitiated. Mr. Barrett followed with a half-plate negative, which he developed with pyro. Messrs. W. and G. E. Martin then developed about one dozen whole and half-plate platinotype prints, hot bath process, describing at length the permanency, simplicity, and beauty of the process.

**Rossendale.**—Monthly meeting, April 27th. The subject, "Naturalistic Photography," was fully discussed by the members present. By the kindness of the Editor of the AMATEUR PHOTOGRAPHER, Competition Prints No. 18 were passed round for inspection.

**Sheffield.**—An interesting lecture was given on the 22nd ult., under the auspices of the Sheffield Camera Club, by Mr. W. Lamond Howie, F.C.S., of London, his subject being "To Ober-Ammergau and back in 1890." Mr. G. T. W. Newsholme, President of the Society, occupied the chair, and there was a large audience. The lecture was illustrated by 100 photographic lantern slides,

which Mr. Howie was enabled to take on his way to and from Ober-Ammergau, and also during his stay at that place, including some scenes from the Passion Play. He visited Bonn, Nuremberg, Cologne, Strasbourg, Munich, Innsbruck, the Bavarian Alps, the Tyrol, and many other cities and districts, and from each he showed excellent photographs illustrating the different styles of architecture to be found in the cathedrals and other magnificent buildings. The interior and exterior, and also the notable details of each building were given, besides views of the streets, museums, bridges, art treasures, and other objects of beauty and interest. Special reference was made to Cologne Cathedral. Nor were the country districts through which Mr. Howie passed neglected, as was shown by his remarkable good genre subjects, including life in the Tyrol. A number of the photographs of the Bavarian Alps were also examined with much interest, and, in alluding to his views of the Passion Play, the lecturer assured his audience that there was no foundation for the rumour that the play would not be repeated in the year 1900. Views of geological interest were also shown, including the curious earth pyramids in the Austrian Tyrol.

**Southport Social.**—On the 22nd ult. Mr. Cross gave a very instructive demonstration on the "Trimming and Mounting of Prints." The 8th ult. was a lantern night, when a large number of slides were exhibited, amongst which were some made by Mr. Wilkinson, from very old negatives of Southport, and which were much appreciated. On the 15th ult. Mr. Cross was very successful in a demonstration on "Transparency Making," on ordinary Ilford plates, the results being very gratifying.

**Spenn Valley.**—The April meeting of this Society was held on the 14th ult. Dr. Farrow (President) was in the chair, and there was a large attendance. Several new members were enrolled, and officers nominated for the coming year. The President gave some interesting information on the new Kallotype paper process, and Mr. A. H. Knowles exhibited a number of members' slides by means of the lantern.

**Warrington.**—The fourth annual exhibition of lantern slides, the work of the members of the above society, took place in the Co-operative Hall on the 21st ult. There was a large attendance, and the exhibition was the best which has yet been held. The chair was occupied by Mr. T. J. Down (President of the Society). There were four exhibitions of slides during the evening. All the slides were the work of members, namely, Miss Harding, and Messrs. H. N. Houghton, J. Smith, jun., J. Chorley, jun., F. Pearson, W. Robinson, Kirby (Bridge Street), J. Hallows, J. Pritchard, C. Yonge, J. Skelton, and J. Harding. The work was far superior to that previously exhibited by the members, and the exhibition was rendered additionally interesting owing to the fact that most of the places illustrated on the screen were familiar to the audience. The Dingle at Appleton appeared to have been a favourite rendezvous of the members, judging from the large number of views of it which were shown. It is certainly one of the prettiest spots within easy access of the town. Among other local views thrown on the screen may be mentioned those of the locks at Bewsey, Twenty-step Bridge at Stockton Heath, St. Thomas' Church, the ornamental pond in the park, Horsemarket Street, Mr. John Crosfield's greenhouses, the new bridge over the Mersey at Walton, with numerous scenes on the Ship Canal. There were also portraits of Mr. Beaumont, Mr. David Lowe, the Co-operative Hall keeper, and of several members of the Photographic Society. The applause of the audience was hearty and frequent.

**West London.**—At the meeting on the 24th ult., the President in the chair, five new members were elected. The President announced that though the Society had not gained the challenge cup at the Crystal Palace, no less than four members had been awarded medals, viz., Messrs. Hodges, Colls, Whiting, and the Hon. Secretary. Mr. Blackmore's paper on "Legitimate Photography" was read by Mr. Hodges, the writer having gone to America. Mr. C. Whiting differed from the opinion of the writer, in so far that he considered a certain amount of brush work quite legitimate. Dr. Low quoted the opinion of an impressionist that artistic effects could only be obtained by lenses with large apertures, so that the principal object only should be in focus. Mr. Whiting believed in sharpness all over, and afterwards producing the required effect with collodion masks, which he described. Mr. Hodges differed from Mr. Blackmore as to the question of flare spot, also as to cutting down prints, and the use of the brush on prints. He saw no harm in doctoring negatives. The President wound up the discussion. Mr. R. Whiting showed a photograph taken with the new automatic machine. A long discussion took place on the subject of getting better premises for the Society.

**Woolwich and District.**—The last lantern night of the season was held on Thursday evening the 23rd ult., at the Masonic Hall, Anglesea Hill, Plumstead, Mr. Desforges working his lantern. The meeting was well attended by members and friends, and a very pleasant evening was passed.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4643. **The Moselle.**—Can any reader give me any information with regard to photography and the expenses of living in the above neighbourhood?—**CAMBRIDGE.**

4646. **Names on Negatives.**—Can any reader give me the best way to write names of subjects on negatives and what materials to use? Any hints will oblige.—**NELLA.**

4647. **Tripod Stands.**—Can any one tell me if Lancaster's tripod stands are as good and as cheap as any that can be got, either for home use, touring, etc.? Also which of his numerous kinds is considered the best?—**PIPER.**

4648. **Hare's Camera.**—Having just purchased a first-rate half-plate Hare's camera, I am now looking for a first-rate lens for the same, and having lately seen Taylor's lenses spoken very highly of in numerous photographic works and journals, I shall be much obliged if any one who has had any experience of them will tell me if it would be possible with the aid of a small stop to obtain equally good results with one of these, and with one of the more expensive lenses of Ross, Swift, Dallmeyer, etc.? Would a Taylor lens require much more stopping down for ordinary landscape work?—**MARSHBANK.**

4649. **Smallest Stop.**—What is the smallest stop that can be safely used for landscapes in a good light without producing flatness, destroying brilliancy and atmospheric effect, etc.?—**CHARLES.**

4650. **Camera Case.**—What is the best, lightest, and most serviceable material for a camera case, and can any one recommend me the cheapest place to go for one, if possible naming price for half-plate size?—**CHARLES.**

4651. **Warwick and District.**—I ask on behalf of myself and three brother amateurs who intend spending three clear days in Whitsuntide week in Warwick and the surrounding district, what are the best places to visit and photograph, and in what order to make the most of our three days? We are good walkers and do not mind distance so that we may get good views.—**BUCKLER.**

4652. **Intensifier.**—Would any of your readers kindly tell me how I can dissolve mercuric chloride (bi-chloride of mercury)? I have about 100 negatives to intensify, but the mercury solution I have (2 oz. mercury, 6 of water) has now been seven weeks and has not dissolved yet. I tried boiling it to-day with no better results; it only turned it into like thousands of pieces of small glass dust. I should be pleased to know also if sulphate of soda or ammonia is the best for flogging over the film after whitening in the mercury. My negatives, after being treated with the above, do not seem much denser than before doing.—**H. S. B.**

4653. **Slowest Exposure, Kershaw Shutter.**—What is the time of the slowest exposure which can be made with Kershaw's shutter?—**A. D. J.**

4654. **Increase of Speed, Kershaw Shutter.**—Can any reader inform me what is the increase of speed gained by each turn of the screw in Kershaw's shutter?—**A. D. J.**

4655. **Potash Developer.**—I am using the potash developer which Mr. Wall advocates in his "Dictionary of Photography," but I find it very slow. Can any one tell me how to hurry up development with it? I use now more of the potash solution than is recommended?—**KENDAL.**

4656. **Colour in Landscape.**—In the foreground a laburnum tree in full blossom, middle distance and

distance an ordinary view of green fields and trees, sky clear blue with white clouds. How am I to photograph a view which includes the above, so as to preserve the relative lighting values of the yellow, blue, and white, using one plate only for the negative? Also how must I modify my pyro-ammonia developer?—**ATICH GEE.**

4657. **Photinus Oil.**—Advertised as being free from smell or smoke. If any of your readers have tried this oil for optical lantern work I shall be glad to hear if their experience of it corroborates its alleged good qualities.—**J. W. R.**

4658. **Liverpool and District.**—Can any Liverpool photographer tell me the most interesting places or views within an easy distance of Waterloo?—**SOUTHERNER.**

4659. **Reproduction.**—Can any reader of the **AMATEUR PHOTOGRAPHER** give me a list of the different processes for printing and reproducing photographs, including silver, autotype, photogravure, etc., also photo-mechanical processes? Is Autotype the same as the carbon processes?—**NIEPCK.**

## QUERIES UNANSWERED.

April 24.—Nos. 4638, 4642, 4643, 4644.

## ANSWERS.

4602. **Intensification.**—The answer to the question of "Foreigner," No. 4297, in the **AMATEUR PHOTOGRAPHER** for last week, answers your question also.—**CAILLOU.**

4602. **Intensification.**—The only possible way to prevent a sky from being intensified is to soak the plate in water till the film is soft, then blot with blotting paper, prop your negative up, sky at the top, swab on the mercury solution with a brush, working from the outline of the landscape downwards, then wash and blacken in the same way.—**OSIRIS.**

4608. **Card.**—The best thing to use is stout drawing paper, which may be had from almost any stationer.—**OSIRIS.**

4609. **Matt Varnish.**—The question of how to apply a matt varnish without getting it on the film is merely one of practice. Personally, I would guarantee to varnish a hundred negatives and not have two failures.—**OSIRIS.**

4609. **Matt Varnish.**—The best way is to apply this as ordinary varnish. It is difficult to prevent it getting on the film, but it is only a question of practice, as you will probably find if you experiment a few times.—**CAILLOU.**

4611. **Madaira, Photographing in.**—A very good article on this appeared a year or two back in the **AMATEUR PHOTOGRAPHER**, giving all particulars.—**OSIRIS.**

4615. **Shutter.**—Solution of india-rubber is the thing, made by dissolving 10 gr. of rubber in 1 oz. of bisulphide of carbon. Why not stick little bits of black coat plaster over it?—**OSIRIS.**

4619. **Development.**—This query is a poser. If the print is evenly and thoroughly soaked it should lie perfectly flat; if it does not, it would be advisable to wash well and dry, and then moisten the parts which require local treatment afterwards.—**OSIRIS.**

4620. **Curled Mounts.**—Damp the mounts before mounting the print, so that print and mount will contract to the same extent when drying.—**CAILLOU.**

4620. **Curled Mounts.**—The secret is to mount on the back of the mount a piece of thin paper the same size as the print. As both sides are now damped, the pull of the one is obviated by the pull of the other.—**OSIRIS.**

4621. **Development.**—I cannot refer you to the letter, but probably the following is what you refer to. When the plate is sufficiently developed, rinse well, and immerse in

Chrome alum	...	...	16 parts.
Citric acid	...	...	4 "
Water	...	...	1,000 "
Sugar	...	...	18 "

Allow to soak for two minutes, drain, and dry. Wash the plates thoroughly before fixing when at home.—**OSIRIS.**

4622. **Photographing Sunsets.**—It is quite possible to photograph sunsets, only it must be borne in mind that the shape, not colour, of the clouds must be looked to. Gotz's orthochromatic plates, about f/22 stop, exposure varies from one-sixteenth to half a second according to colour. Developer weak in pyro first, then more added towards the last.—**OSIRIS.**

4623. **Stained Negatives.**—Insufficient washing between bleaching and blackening the cause, and possibly also non-elimination of hypo. This is a fault extremely difficult to correct. The best remedy is stated to be treatment with a weak acid solution of chloride of gold, then washing and fixing.—**OSIRIS.**

4624. **Changing Bag.**—You will find directions in back numbers, or in the "Amateur Photographers' Annual," one of the most useful books ever published.—**OSIRIS.**

4625. **Density.**—Increase of pyro means increase of density.—**OSIRIS.**

4629. **Permission to Photograph.**—Apply to the authorities in each place, who will give you the necessary permit.—**OSIRIS.**

4630. **Godstone's Print Washer.**—The washer can be had from almost any dealer; also Ponders and Baker, 47, Featherstone Street, Finsbury, London, E.C. Houghton's address is 83, High Holborn.—**OSIRIS.**

4631. **Borax Bath.**—The following I have used for ten years, and it has always been very successful:—  
Stock Solution.

Chloride of gold...	...	...	15 gr. tube
Water	...	...	15 drm.
For toning, use the following:—			
Chloride of gold	...	...	1 drm.
Ground borax	...	...	2 oz.
Water, warm	...	...	12 "

I find this always gives beautiful purple tones. After toning, wash well, and place in a bath. To fix, hypo 1 oz., water 20 oz., leave prints in this bath for 10 minutes, then wash well for several hours.—**H. S. B.**

4631. **Borax Bath.**—The tone of an albumen print does not depend entirely upon the composition of the toning bath; the quality of the negative has more influence. A thin, flat, quick-printing negative gives brown tones; with a dense, slow printer it is less difficult to get the purple tone. The brand of paper you name is not the best for obtaining the tone you wish, unless your negatives are suitable. You have too much borax in the bath. Try this:

Borax	...	...	2 gr.
Boiled water used warm	...	...	10 gr.

Then add 2 gr. gold chloride for each sheet of paper you wish to tone.—**A. R. F. E.**

4631. **Borax Bath.**—  
(A).  
Borax ... .. 1 oz.  
Water ... .. 80 " (3 gal.)  
Dissolve, and keep in a stoppered Winchester.  
(B).

Gold chloride ... .. 15 gr.  
Distilled water ... .. 15 drm.  
Dissolve, and keep in a stoppered bottle. Add 1 drm. of B to 8 oz. of A one hour before bath is wanted. This quantity of gold should tone one sheet of paper to a deep purple if prints are from suitable (vigorous) negatives.—**JAMES WOOD.**

4632. **Norway and Sweden.**—Customs authorities very good. If only small amount of baggage will probably not be examined. As a precaution, write the following across the packets of plates: "Photografiske plader maa ikke aabnes uden ven rodt lys." If a hand-camera is used, can strongly recommend Thomas' extra rapid thickly coated plates.—**C. E. G. K.**

4633. **Lens and Developer.**—(1) The sole advantage of the portrait is that it is twice as quick, but the disadvantages quite overbalance this rapidity. (2) Use your ordinary developer with less pyrogallol solution; hydroquinone does not suit this class of work. (3) It depends upon how sharp you want the background to appear in the print.—**A. R. F. E.**

4633. **Lens and Developer.**—(1) Portrait lens is best for portraits, the next best a single lens. Read and thoroughly digest the articles on "Home Portraiture" now appearing in **AMATEUR PHOTOGRAPHER**. (2) Paul Lange's soda developer answers admirably for Ilford. (3) Depends on focus of lens; background should be out of focus as a general rule.—**JAMES WOOD.**

4633. **Lens and Developer.**—In answer to "Developer," I find for the Ilford plate the following to answer and give better results than any other you could use:—

Hydroquinone	...	...	No 1.
Potassium bromide	...	...	2 drm. 2 scruples.
Sulphate of soda	...	...	1 scruple 10 gr.
Water	...	...	2 oz.
	...	...	No 2.

Soda hydrate ... .. 1 drm. 2 scruples.  
Water ... .. 2 oz.

For development, use equal parts of No. 1 and No. 2. This will keep for a long time if well stoppered. Take 1 oz. of No. 1 and No. 2 for developing. This will do for a dozen or more plates, as it does not lose its power.—**H. S. B.**

4634. **Lens.**—Yes, but the subject included will be greater than if you used a longer focus than the portable symmetrical.—**A. R. F. E.**

4634. **Lens.**—If full aperture is to be used, No. 5 will be best, as the focus of a lens should, as a rule, be equal to the diagonal of your plate. But the medium stop of a No. 4 is stated to cover a half-plate properly. For ordinary work, a lens with a longish focus is preferable.—**LSIS.**

4635. **Hire of Hand-Camera.**—If "Detective" and "M. A. J." will communicate with me I can tell them about hiring a detective. (Address with Editor).—**J. R. W.**

4636. **Matt Surface.**—Rub them very gently with the finest powdered pumice stone in a circular direction, but it needs care. By a careful arrangement of the lighting the prints could be copied as they are.—**A. R. F. E.**

4636. **Matt Surface.**—"Phos" had better mount the prints to be copied on a piece of cardboard, and

rub the surface with some powdered pumice stone with the tip of the finger. A much better result can be obtained by mounting the print in optical contact with glass, and then copying as when mounted in this way the granularity of the paper is not seen in the copy.—CAILLOU.

4636. **Matt Surface.**—You do not require to do anything of the kind if you place the print at such an angle to the light that the surface does not reflect on to the lens. I have copied albumen prints that showed no difference whatever from the original, and might have been taken direct. Of course, the smoother the prints the better.—ISIS.

4637. **Copyright.**—Yes, certainly.—A. R. F. E.

4637. **Copyright.**—If the photographs of the pictures have been copyrighted you certainly have no right to copy them. I believe that even if the photographs are not copyrighted at the time you copy them, the owners of the negatives can afterwards copyright them, and prevent any future sales of prints from the negatives you have made. The best way would be to take a direct photograph of the pictures.—CAILLOU.

4639. **S.W. of England.**—It depends entirely on the kind of picture "Alpha" prefers. In the neighbourhood of Torquay it is all picturesqueness; Penzance affords as well seascapes with fishing boats, romantic headlands, and ancient monuments. Near Torquay, the best pictures are at Austey's Cove, Babbicombe Bay, Oddcombe Sands, Watcombe Rocks, Cockington, and Compton Castle. Six miles off is Teignmouth, where fair seascapes are to be had. Inland, the charming views round Dartmoor are not far off, as Holne Chase, the Buckland drives, the Bovey Valley, Becky's Falls, the lovely village of Manaton, Lustleigh Cleve, and some of the Tors, as Hey Tor, Rippon Tor, and others. On the other side is Totness, Berry Pomeroy, and the Dart. Penzance has many picturesque bits, as Castle Horneck, Trembath, Trevayler, Gulval, Trersiffe, Buryas, Blue Bridge, etc., but the stranger would have a difficulty in finding them, as the neighbourhood is a network of footpaths. St. Michael's Mount is, of course, full of interest. For seascapes, Penzance is absolutely unrivalled, and the quaint (and odorous) fishing village of Newlyn, beloved of artists, is only a mile off. In the Land's End districts are picturesque coves like Porthcurnow, Porthgarra, etc., and numerous grand headlands, as the Land's End itself, Castle Trevery, Tolpeda-penwith, Pardenick Point, Gurward's Head, etc. Ancient monuments are numerous and most interesting, as the stone village of Chrysanster (pre-Roman); stone circles, as Boscawen-un and Lamorna; cromlechs, as the Lanyon Quoit, Chun, etc.; inscribed monuments, as Men-scra, and at Blue Bridge, and the curious Men-an-tol. Further off is the Lizard Point and the famed Kynance Cove, and the lovely views on the Fal, which are best at Malpas and King Henry's passage. St. Ives is only seven miles from Penzance, and Helston, which has some very picturesque bits, about the same.—G. LACY.

4640. **Landscapes.**—Distance is better rendered. Yes, but of no consequence.—JAMES WOOD.

4640. **Landscapes.**—You will have a narrower angle, that is, longer focus lens, and so distant objects will appear larger, but you will not be able to include so much subject. Yes, the rectilinearity is destroyed.—A. R. F. E.

4641. **Lens for Landscape Work.**—A long-focus single lens.—JAMES WOOD.

4641. **Lens for Landscape Work.**—A single landscape lens, such as Taylor's, Dallmeyer's, or Grubb's is much better for views than a rectilinear. Don't use a wide-angle lens if you can possibly avoid it. Taylor's rapid view lens has a great reputation. Address Taylor and Hobson, 6, Southampton Street, Holborn. Price reasonable. If you use one of the combinations of a R.R., you double the focus, get a larger image, and have to rack the camera out very far. Some cameras will not do it. Besides this, you must expose four times as long.—ISIS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

LEO.—Both your negatives are much over-exposed and are consequently flat. We should have thought, under the conditions you name, viz., bright diffused light and  $f/18$  and an ordinary plate, two seconds would be a full exposure for the subject.

C. A. T.—There is not the slightest objection to your using rusty crystals of ferrous sulphate; when weighing out any quantity, allow a little for waste (about 20 gr. for every ounce), place the crystals in cup or measure, pour on them just enough water to cover them, adding a little sulphuric acid to the water first, stir round sharply once or twice and pour the water off. There is no fixed proportion between a saturated solution and the dry

chemical, even with the same chemical; the strength of the so-called saturated solution varies according to the temperature. It is advisable, if you want to know how to account for results, to use definite strength solutions. You will find a table at the end of the "Dictionary" which will tell you the solubility of most chemicals.

REX.—(1) Never allow the sun to shine on your sitter—whilst you are taking him, at any rate. Two seconds would be ample though. (2) It is advisable always to use the formula suggested by the maker. The following we have used with success for most brands:

(A).	
Pyro ... ..	1 oz.
Glycerine ... ..	1 "
Methylated spirit, to ... ..	9 "
Citric acid ... ..	40 gr.

(B).	
Liq. ammon. fort. '880 ... ..	1 oz.
Distilled water ... ..	9 "

For normal exposure mix equal parts of each and dilute with 33 parts of water and add restrainer as required. (3) The following is a good formula:

Chloride of gold ... ..	1 gr.
Acetate of soda ... ..	30 "
Carbonate of soda ... ..	15 "
Distilled water ... ..	10 oz.

for every sheet of paper; leave for twenty-four hours before using. (4) The longer focus lens is certainly preferable for portraiture. (5) Old negative glasses are utterly valueless.

T. T. S.—Both negatives are grossly over-exposed, the prints are over-toned. The great difference between over and under exposure is this—under exposure gives want of detail, especially in the shadows, with generally dense high lights or extreme contrast; over-exposure gives plenty of detail, especially in the dark shadows, but the negatives are thin and wanting in contrast. Send us up half-a-dozen numbered prints and we will point out examples of what we have said.

CAMERA.—The plate is very much over exposed and under developed; we should have thought about  $\frac{1}{15}$  secs. plenty. Marion's address is 22, Soho Square, London, W.

SPIKE.—It looks to us as though you had been working against the light, had under-developed and used too much accelerator to commence with. You give us no data as to developer.

ENTERPRISE.—The Garden Party is much too cramped. You would have done much better to have merely had a group, minus tea table; technical work, good; cows, good; we should cut off the boys and one inch of foreground. Portrait of clergyman, good. Miss Katie, a little too much top light—a somewhat longer exposure would have given you a rather more harmonious result; the print is a little bit hard; snow a little too hard in the high lights, the result of too much pyro in your developer. Please number future prints. Shall we return these?

F. W. BROCK.—Please let us know whether you want the background to roll up or not, to stand the outdoor weather, or to be kept under cover. We are much obliged for the salt; we will make comparative experiments and send you a report before noticing same. From the formula you give, which by the bye is different to that usually assigned to the sesqui-carbonate, it should be midway between the two usual salts.

V. SUTHERLAND.—The alum and acid bath is used to prevent yellow stains caused by the oxidation of the iron developer. Your stains may be due to three causes—(a) insufficient clearing; (b) insufficient washing between clearing and fixing; (c) use of hypo which has been previously used for plates. The flashing out of the dark marks is probably due to dirty fingers. Send us up a spoilt print or two and we will help you further.

HISPANIO.—Your name is entered.

J. H. R.—We have examined the camera, and think it is simple and efficient, and one which should be able to turn out good work. We should advise you to call on the maker at 20, Bridgewater-square, Jewin-street, E.C.

J. COLLIS.—The lens you name is a very good instrument, and quite suitable for a quarter plate camera.

BEGINNER.—We do not quite understand what are the diameters of your stops; if  $f_{10}$ ,  $f_{16}$ ,  $f_{20}$ ,  $f_{22}$ , of an inch, they are respectively  $f/11$ ,  $f/16$ ,  $f/20$ ,  $f/22$ , and the exposure would be as 1, 1, 3, 5, 6.

STRUGGLER.—Probably your fault lies in using too much pyro in your developer, consequently you get your high lights too dense. Send us up some specimens, and then we'll try and put you right.

WILLIAM SEATON (Quebec).—For film negatives you can print from the celluloid side of the negative, and thus save the double transfer. The best books on the carbon process are Monckhoven's treatise and the A.B.C. Guide, published by the Autotype Company, who would supply the materials, but they can also be got from any dealer either this or your side of the water.

H. M. H. P.—We should advise you to see the tripod reviewed by us in last week's issue, p. 301; though not very high, it is very rigid and not cumbersome. Letter by post.

SUTTON.—We place lenses as follows, 1, 2, 3, 5, 6, 4.

E. L. DELARNE.—At the price you mention you cannot expect all the good qualities of a hand-camera, but we have seen very good work done by the camera you mention.

CHLORIDE PAPER.—Before squeegeeing chloride prints to glass it is necessary to either polish the glass with French chalk or else rub over it a little solution of wax:

Yellow wax ... ..	12 gr.
Resin ... ..	2 "
Turpentine ... ..	1 oz.

Melt the wax and resin and add the turpentine. Rub a little of this on the glass all over, and then polish with a clean rag.

ICONOCLAST II.—Give your prints a dip in the chrome alum bath recommended by Mr. Wall in our correspondence columns a month or two back. For the Alpha plates the developer you are using is much too strong. Try the following:

Pyro ... ..	1 gr.
Carbonate of ammonia ... ..	13 "
Bromide of ammonia ... ..	1 "
Distilled water ... ..	1 oz.

To clear your fogged slides, try a gentle reducer of red prussiate of potash and hypo.

S. HOLDSTOCK.—(A) Shutter exposures can certainly be made on a dull day, but obviously the duller the light and the quicker the shutter, the more miserable the results. (B) The elliptical shutter gives about one-fifteenth of a second. (C) Black tones require very deep printing and the chloride of lime or the combined uranium and gold bath, both of which we give you:

(1).	
Chloride of gold ... ..	1 gr.
Common chalk ... ..	10 "
Chloride of lime ... ..	1 "
Distilled water ... ..	8 oz.

Mix, allow to stand twelve hours, and filter. The above will tone one sheet of paper.

(2).	
Chloride of gold ... ..	1 gr.
Uranium nitrate ... ..	1 "
Salt ... ..	15 "
Acetate of soda ... ..	15 "
Distilled water ... ..	8 oz.

Neutralise the gold and uranium with soda, add the other salts and water. (D) The ordinary ferrous oxalate, to every ounce of which 1 dr. of sulphurous acid has been added. (E) Your washing is hardly thorough. Place your plate in a dish, allow to soak for ten minutes, empty and refill; continue this for an hour. (F) The platinotype process, like everything else, wants learning, then it is by no means difficult. It is easier than many other processes because of the high price of platinum.

R. BONNELL.—You could get a camera obscura model finder from Lancaster, Underwood's or any of our advertisers, and a little brass catch at the top and side of camera would enable you to fix on and take off.

MARTIN.—If you block out A and C you ought then to be able to turn out good work, as you could light from either side, that is to say, the camera could be either near A or near C.

H. H. OORB.—A good blacking may be made by rubbing lamp-black or ivory black into a cream with japaner's gold size and adding a little turpentine. This will do for woodwork. For metal, grind a little lamp black up with ordinary hard varnish. You can obtain a good black varnish from Tylar's, Upson of Maidenhead, or Bate's black from almost any dealer.

MOORE.—Your fault lies in using a rapid plate. You should have used a slow transparency plate, such as is used for lantern slides. We have, in default of these, used an ordinary landscape plate, but prefer a lantern rapidity. Over-exposure should be avoided and a developer strong in pyro and bromide used.

J. B. (Havant).—(1) We should advise you to obtain a wide angle and medium angle rapid rectilinear and a narrow angle landscape lens. We should choose either Suter's rapid aplanat D No. 3 of 13 $\frac{1}{2}$  focus, and Suter's C lens No. 3 of 8 in. focus, or else Ross's new extra rapid symmetrical of 10 $\frac{1}{2}$  and the Suter C lens, and then Wray's narrow angle landscape lens, of 12 in. focus, and one of Swift's 16 in. focus landscape lenses. With these lenses there would be no subject you could not tackle. (2) We do not think there is much, if any, choice between the two makers. (3) The advantage of Ross's new lens is the large aperture,  $f/5.6$ . We had one of these for 10 by 8 to examine the other day, and it struck us as being as nearly perfect as it is possible to make a lens. (4) There is never a statement made but what some one will sneer at it. We always use single lenses, and certainly believe in their superiority, and frequently use them when perhaps an R.R. should be used.

E. S.—Edwards's Isochromatic plates are not specially sensitive to red, and therefore you cannot expect them to do an impossibility. Vogel's Azaline plates have a decided higher red sensitiveness and would probably do what you want. If you want real and decided red sensitiveness you must sensitise your own plates either with cyanine or preferably a bisulphite compound of cerulean blue. You can obtain just the effect you want by using at screen

which will cut off all but the red rays of light, and then afterwards exposing for the yellow, green and blue. You must not lose sight of the fact that you would have to develop your plate in total darkness were it very strongly red sensitive. We shall be pleased to help you further if we can.

W. H. CLARK.—Lens to hand. Report to follow.

G. M. S.—We will write you.

CORNWALL.—None of the lenses have been sold. WANTED, the address of Thistleton, a camera maker.

ATCH GEE.—We will try and supply an article upon the subject you mention, but Messrs. B. J. Edwards and Co., of Hackney, hold patents for the orthochromatising of plates and very jealously guard their rights.

R. B. SHAWCROSS.—Many thanks for your prints. WINZER AND Co. (Dresden).—The letter sent us has been forwarded to Mr. Winn.

ANXIOUS.—We can and shall be very pleased to test the lens for you, but under the circumstances it will be wiser for you to send it to the lens testing department of the Royal Society, Kew Observatory. You will then get a certificate which no maker can gainsay.

THOMAS BROTHERS.—Many thanks for the honour. When you are quite settled with you please send us further particulars for publication.

## Quarterly Examinations in Photography.

### QUESTIONS.

- Why are alkaline salts added to a toning bath, and explain the action of a toning bath?
  - Is it preferable to use a swing-back or moveable front to a camera? State reasons for answer.
  - What are the chief causes of fading in prints?
- (Latest Day for Answers—May 11th.)

### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
  - All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
  - A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.
  - Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.
  - Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.
- NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Safe and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Safe and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of

2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc. — AMATEUR PHOTOGRAPHER, vols. vii. to xii; 17 "Reporters," vols. i, ii.; 12s. 6d.; exchange hand-camera, ether saturator, new, 21s., or offers.—Horth, Bath Street, Hereford.

About 250 numbers of AMATEUR PHOTOGRAPHER, from October, 1886; "Photography," from No. 9; "Photographic News," with index for 1887, several Journals, and others; state wants; what offers?—C. Naylor, Batley.

AMATEUR PHOTOGRAPHER, Nos. 181 to 222, forty-two numbers in all; what cash offers?—E. C. Brown, 368, Kingsland Road, N.E.

Backgrounds.—Two flatted oil backgrounds, 8 ft. by 6 ft., conservatory with palms, rustic arbour with creepers, handsome scenes, and well painted, new condition, and on rollers; 20s. each; 35s. the two.—Hill, Hampton Road, Twickenham.

Bicycle.—Cushion tyre diamond frame Safety, ball bearings throughout (pedals included), first-class machine, faultless condition, good make, beautifully nickel-plated, easy running machine, and good hill-climber; £7 17s. 6d.; genuine bargain; satisfaction certain; approval willingly.—Z., 34, Hill Street, Ipswich.

Cameras, etc.—Camera (by Hare), 7½ by 5½, five double slides, carriers for half and quarter plate, best make and finish, and in excellent condition, a bargain to anyone requiring a camera in which extreme portability is not of first importance.—Herbert Jones, Derby Terrace, Huyton, Liverpool.

Half-plate camera, three double slides, best quality, good as new; £1.—B., 1, Balfour Terrace, Mayes Road, Wood Green.

Watson's half-plate camera, three backs, etc., etc.; £3.—M. Dowell, Larkhill Terrace, Blackburn.

Lancaster's quarter-plate Instantograph camera, with all appendages; particulars given; offers.—R. Johnston, Abbotsholme, Rochester, Stafford.

Half-plate Sands and Hunter's Gem camera, three double backs, all brass-bound; list price £10 15s.; accept £8 5s.; new. This low price should attract the attention of those requiring a first-class set.—6, Montford Place, Kennington Green.

Cameras, Lenses, etc.—Quarter-plate Lancaster's Instanto, with superior rectilinear lens, two double backs, and stand, complete, 25s.; very superior dark box for 7 by 5 plates, 2s. 6d.; strong lead-lined developing sink, cost 20s., price 10s.—J. D. Pearson, Chilwell, Notts.

Lancaster's half-plate Instantograph camera, 3 double dark-slides, tripod, lens with instantaneous shutter, offers? Ross' half-plate portable symmetrical lens, 55s.—R. Hitchens, 34, Longcross Place, Cardiff.

Half-plate Lancaster's 1891 Instantograph camera, dark-slide, tripod, fitted rapid rectilinear lens, as new, for 70s.—2, Hawthorn Villas, Slad Road, Stroud, Glos.

Lancaster's Instantograph camera, combination Rectigraph lens, Chronolux shutter, Universal stand, three dark-slides, etc., cheap; exchange good hand-camera.—Copeman, Hensbridge.

Quarter-plate Instantograph special 1891, brass-bound, three double dark-slides, Taylor, Hobson R.K. lens, and lock-up case, perfect condition; cost £5; sell 70s.—No. 147, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Watson's half-plate Acme camera, three double backs, turntable in base, £7 (list price £10 17s.); solid leather case for ditto, 17s.; Optimus R.E. lens to cover 7 by 5, 35s.; Thornton-Pickard shutter to fit same, 17s.; Wray's W.A. landscape lens, 10 by 8, 50s.; Ferrero's half-plate film-holder (carries 24 celluloids), to fit above camera, 35s., all perfect; also quarter-plate hand-camera, with splendid R.E. lens, 6 in. focus, rotating stops, two finders, focussing screen, six double backs (made to order by Thistleton), focussing by engraved scale, altering stops or shutter-speed, all done from outside, useable on tripod, cost over £12, offered for £3 15s., thoroughly efficient.—Davis, 87, Church Road, Richmond, Surrey.

Half-plate camera, latest improvements, three double slides, 7 by 5 rapid rectilinear, and Thornton-Pickard time and instantaneous shutter, with tripod and black hand-bag for same, all new last season; £6 10s. lowest.—H. C., 6, Gloucester Road, South Hackney, N.E.

Lancaster's half-plate Instantograph, splendid lens, double back, and tripod, complete; 52s. 6d.—W. Taylor, 23, Havelock Street, West Hartlepool.

Quarter-plate International camera, lens, tripod, four double backs; £2 cash, or exchange. See hand-cameras wanted.—Kosslyn, Bray, Co. Wicklow.

Lancaster's quarter-plate Instantograph, Wray's 5 by 4 rapid rectilinear lens (new), Kershaw's shutter, view finder, tripod, printing accessories, etc.; £3 3s.—R. Ballard, 86, Bartholomew's Hospital.

Half-plate rectilinear lens, with stops, perfect condition, £2; pair Dallmeyer's stereo lenses, camera, slides, etc.; No. 1 Dallmeyer's triple, what offers?—Bromhead, 1, Regent Street, Clifton.

Half-plate camera, with lens, stand, two double backs, and focussing cloth, complete, only 25s., satisfactory work can be shown; canvas bag for above, 3s. 6d.—Keeling, 16, Everleigh Street, Tooting Park, N.

Lancaster's 1891 half-plate Instantograph, slide, tripod, and Optimus R.K. lens, as new; bargain, 88s.—93, Slad Road, Stroud.

Whole-plate Stereoscopic Co.'s best light camera, every movement, three double backs, Optimus 9 by 7 R.S. and W.A. lenses, pneumatic shutter, focussing cloth, tripod, solid leather case, equal new; cost £28 10s. 6d.; price £17 10s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Camera, full-plate, best quality extension, for sale, fitted with every convenient appliance, two lenses (Ross), four double dark-slides, carriers, Eastman's frames, tripod, in two portable strong leather bags, instantaneous shutter, and complete outfit, with dishes, printing frames, lamp, etc. Half-plate ditto, London Stereoscopic Co.'s best make extension and outfit. Owner will initiate, by correspondence, any purchaser unacquainted with photography into its rudimentary mysteries.—Apply, Executor, Florence Villa, Portsmouth, Southampton.

Dark Boxes.—What offers in rabbits for splendid collapsible dark box, for developing under 4 lbs., in splendid condition?—H. Price, Stag, East Finchley.

Hand-Cameras, etc.—No. 1 Kodak, with leather case, quite perfect, loaded with 100 exposures; price £2 15s.—R. Seymour Benson, Stockton-on-Tees.

Griffiths' Guinea camera, as new; 14s.; or exchange.—Arthur Baird, 22, Strickland Street, Newcastle-on-Tyne.

Hand-camera, focussing screen, three double slides, Optimus rectilinear lens, Kershaw shutter; exchange Euryscope half-plate lens, camera, or offers.—Vicary, Grocer, 32, Bloomfield Street, Dalton, N.E.

Nos. 1 and 2 Demon defective cameras, with dark bags and ruby lamp; 13s. the lot.—R. F., 11, Shepherd's Place Buildings, Mayfair, London.

Cash wanted; defective camera, complete, 4s. 6d. post free, cheap.—Wainwright, Grocer, Castleford.

Will exchange Facile camera for 9 by 7 Optimus rectilinear lens; whole-plate camera wanted for cash.—Lofthouse, Holmedale Terrace, Harrogate.

Lenses, etc.—For sale, a good portrait and enlarging lens (by Cox); 30s.—J. A. Benham, Goring-on-Thames.

12 by 10 Optimus rapid rectilinear, quite new, capital instrument; offered for £5 10s.—O., 101, Queen Street, Exeter.

For sale or exchange, Grubb's 5 by 4 portrait lens, cost £3, price 70s.; also Shepherd's half portrait lens, on approval; deposit.—Sykes Crowther, Pudsey, Leeds.

Ross' No. 3 portrait lens; cost £17 10s.; price £10; good quarter-plate hand-camera accepted in part exchange.—Ethelbert Henry, Alveston, Derby.

Lens, rectilinear, 7 by 5, covers grand to edges, hood, stops f/8 to f/32; 25s.; approval.—Adams, Hermitage Mews, Stamford Hill.

Ross' whole-plate portable symmetrical lens, very little used; £4.—T. Blackshaw, Strawberry Bank, Blackburn.

Two first-class rapid rectilinears, Waterhouse stops, quite new, perfect definition; quarter-plate, 17s. 6d.; half-plate, 23s. 6d.; approval.—M., 73, West Clowes Street, Salford.

Ross' No. 5 portable symmetrical, 70s., new last season.—H., 55, Val Palsant, Jersey.

Optimus R.K. lens, splendid definition, 6 by 5, new; cost 45s.; post free on receipt of 33s.—102, Shaftesbury Road, London, N.

Optimus rapid rectilinear, 5 by 4, quite new, 25s.; Ross' 4 in. portable symmetrical, 3s.; first cash accepted.—Rev. J. Henning, Kingsbridge, Devon.

10 by 8 rectilinear, cheap for 30s., no cap; whole-plate view and group lens, 15s.; Decoudan's photometer, new, 5s.; home-made whole and half plate bellows cameras, rack and pinion, cheap.—Holloway, 215, St. James's Road, Bermondsey.

7 by 5 Optimus rapid rectilinear, perfect, no fault, 35s., makers' price 49s. 6d.; excellent half-plate lens, with instantaneous shutter, 22s.; half-plate wide-angle, 11s.; 10 by 8 lens, 2s.; quarter-plate camera slide and stand, 10s.—Robert Dixon, Branganza, Wandsworth Common.

Half-plate R.K. Laverne, Waterhouse stops f/8 to

f/64, fine definition, covers plate well to edges, negative and print taken with f/8 can be seen; worth 20s.; take 25s.; as new, approval.—Dudin, 4, Fenchurch Street, London.

Whole-plate rapid rectilinear lens, f/8; bargain, 35s.—14, George Street, Stroud, Glos.

**SETS.**—Lancaster's quarter-plate outfit, nearly new, 30s.; induction coil, 2 in. spark, commutator, vacuum tubes, brass model engine and boiler; offers. 180, Heyside, Royton.

A gentleman giving up photography wishes to dispose of his complete set, consisting of Meagher's whole-plate camera, Ross' R.R. lens, fitted with Newman's shutter and iris diaphragm, three cases, nine printing frames, two lamps, retouching desk, dishes, and every requisite for photography, excellent condition; cost over £40; will sell for £22; seen by appointment.—No. 146, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Half-plate photographic outfit, equal to new, by good maker, and comprising Tourists' camera, with three double backs, three lenses (each with instantaneous shutter), cowhide bag, and shoulder strap, ash tripod and case, and all the sundry articles required in an amateur's outfit; full printed descriptive list on application.—Thomas M. Woodhead, 27, Forster Square, Bradford.

**SHUTTERS.**—New repeating shutter, for instantaneous or prolonged exposures, no setting required, fitted with pneumatic release; 18s.—Meadway, Vestry Hall, Bethnal Green.

**STUDIO.**—Studio (wooden), 20 ft. by 9 ft. 6 in., lighted for portraits both ends, on the best and most modern principles, with dark-room attached, 8 ft. by 4 ft., built in portions and bolted together, roof covered with linoleum, perfectly watertight, nearly new; price £10; owner leaving.—Whitehead, Photographer, Carleton, Skipton.

**SUNDRIES.**—Complete plant and appliances for colotype, nearly new; price £10 10s.—Apply Colotype, care of AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

On sale, cases for complete half and quarter plate

outfits; 9s. and 5s. each, carriage paid. — 4, Eaton Street, Hanley.

Remington carbine and sword bayonet, in perfect condition, captured during Egyptian war; what offers? Whole-plate single lens wanted.—Ethelbert Henry, Alvaston, De by.

Tylar's half view-finder, unused; 4s.; cost 7s. 6d. — F. Poste, Halleybury, Hertford.

Houghton's changing tent, 18s.; Eastman's half-plate roll-holder, with transparent film, £2; Newman's patent shutter, £1; Shew's detective case, for their quarter-plate hand-camera, 12s.; six dozen quarter-plates, Paget's, and Elliott and Son's, 3s.—W. Pratt, 27, Regent Street, Nottingham.

Microscope object glass (Wray's 1-10, with adjustment), in case, new; 50s.; bargain.—R. H. Wilson, Chemist, Kirkcaldy, N.B.

Spratt's patent rabbit hutch, new, four compartments, cost 90s., also five good Belgian hares, offered in exchange for photographic apparatus or optical lantern — E. Jewitt, Matlock.

Background, painted, 10s.; head and body rest, £1; burnisher, 8 in., Vevers' lamp, 9s. 6d.; 1000 each of cabinet, c.d.v., designed tissues, 3s. 6d.—Smith, jun., 76, High Street, Wavertree.

**TRIPOD.**—Whole-plate folding tripod (by Wratten and Wainwright), equal to new, cost 28s., price 10s.; also light quarter-plate tripod, 5s. 6d. — E. Jewitt, Matlock.

### WANTED.

**Cameras, etc.**—Lancaster's half-plate instantaneous camera, double backs, and tripod, without lens.—A. C., 33, Stroma Terrace, Seven Sisters' Road, Tottenham.

7½ by 5 camera, Acme, Beck's, or McKellen's preferred.—Herbert Percy, Harbour Office, Penzance.

**Cameras, Lenses, etc.**—Waterproof case for 7½ by 5 square camera, lens, three slides, also tripod; must be good and cheap; full description; approval.—Amateur, Milford Hall, South Milford, Yorkshire.

Good half-plate camera, rectilinear lens, stand, and double back, all modern type, with latest im-

provements; about four guineas. — No. 137, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Half-plate camera, rapid rectilinear lens, and sundries, must be good and cheap, cash; full particulars.—Frith, 53, Sayer Street, New Kent Road.

**Hand Cameras, etc.**—No. 3 Kodak, junior, must be perfect and loaded.—R. Seymour Benson, Stockton-on-Tees.

Hand-camera, cheap for cash; specimen print.—T. 39, Isledon Road, London, N.

Hand camera, Ideal, or Swinden and Earp's, in perfect order, state lowest cash price, or cash and International quarter-plate set, four double backs; deposit; approval.—Rosslyn Bray, co. Wicklow.

To hire for fortnight, Swinden's or other good quarter hand-camera, R.R. lens. — Samuel Wells, Goole.

Kodak, No. 3, in exchange for half-plate stereo set, complete.—Ethelbert Henry, Alvaston, Derby.

**Lantern.**—Oil lantern, in good condition, with or without lens.—Ingram, 21, Drummond Street, Wolverhampton.

Magic lantern, good; state particulars and price.—4, Eaton Street, Hanley.

Enlarging lantern, in good condition, state price and maker; half-plate double dark wood slides, same size as Tylar's metal. — No. 145, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lenses, etc.**—A Dallmeyer's rapid landscape long-focus lens, 10 by 8 or 6½ by 8½, or a wide-angle landscape lens, same size and same make.—F. C. Barton, Saffron Walden.

Pair stereo lenses; exchange enlarging lantern.—Young, 2, Royal Terrace, Paisley.

**Shutter, etc.**—A time and instantaneous shutter and leather or canvas case for half-plate camera, etc., must be in good condition and cheap. — P. R. Thomason, 14, Jesus Lane, Cambridge.

Shutter for 2½ in. hood, Thornton-Pickard or Ker-shaw preferred; also half-plate Eastman's roll-holder, must be in good condition and cheap for cash.—A. Spiller, Hillside, Hampstead Hill Gardens, N.W.

## CROUCH'S LENSES

or Landscape, Interiors, Stereoscopic Work, or for any special requirement, Trade, Professional, or Amateur.

WRITE FOR ILLUSTRATED CATALOGUE, ETC., WITH PARTICULARS, TO

**HENRY CROUCH, Ltd., 66, BARBICAN, E.C.**

TO H.M. GOVERNMENT, OXFORD, CAMBRIDGE, AND LONDON UNIVERSITIES, Etc., Etc.

For Hand Cameras see "Crouch's Presto." Carries 24 plates, instantaneous change, no bags. Full particulars on application.

# THE AMATEUR PHOTOGRAPHER

Telephone No. 1645      Telegraphic Address: VINEY, LONDON      Office: 1, Greef Lane, Ludgate Hill, London, E.C.

No. 344. Vol. XIII.]

FRIDAY, MAY 8, 1891.

[PRICE TWOPENCE.]

## OUR VIEWS.

"To hold as 'twere the mirror up to nature"—Shakespeare.

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.*

**OUR VIEWS.**—Monthly Competition, No. 24, "River Scenery"—Photographic Exhibition at Leeds—The Exhibition at Vienna—The Financial Result of the Liverpool Exhibition—The Hackney Society—The Postmaster-General and the AMATEUR PHOTOGRAPHER—The Challenge Cup and the Crystal Palace Exhibition—Prospective Programme of the Photographic Convention of the United Kingdom—Wanted a Society at Streatham—Mr. W. Lamond Howie writes us about the Competitions—Dark-Rooms—The "Tourist's Index"—The Oldham Society—The *Pall Mall Gazette* upon the AMATEUR PHOTOGRAPHER—"Public Schools' Competition"—The New Gallery—The Camera Club Soirée.

**LEADER.**—Home Portraiture.

**LETTERS.**—What is an Amateur? (F. S. James; G. H. P. Burne; Leslie Selby; James Wood; S. Francis Clarke; W. H. Whittard)—Explosion of a Regulator on an Oxygen Gas Cylinder (C. Goodwin Norton)—Distinguishing Colours (X. Y. Z.)—What is Meant by the Term Instantaneous as applied to Photography? (W. B. MacCabe)—Society for Streatham (Reginald C. Gould)—The Exhibition at Brixton (F. W. Levett).

**COMMUNICATED ARTICLES.**—Composition, and Light and Shade, illustrated (Robinson)—Instantaneous Photography, illustrated (Harrison)—Photographic References (Nott).

**NOTES.**—Thursday Evenings at the Camera Club—Edinburgh—Paris—Liverpool—The "Practical Photographer's" Federation.

**THE PICTURE GALLERIES.**—New Gallery Summer Exhibition.

**AMATEUR PHOTOGRAPHER'S List of Dark Rooms.**

**SOCIETIES' MEETINGS.**—Bath—Barnow-in-Furness—Belfast—Birkenhead—Brighton—Brixton and Clapham—Burnley—Croydon Micro.—Dublin Y.M.C.A.—Holborn—Lantern—Liverpool—Loughboro'—North Kent—Phot. Soc.—Richmond—Royal Society—Stockton—West London.

We have the pleasure to announce the prize winners in the AMATEUR PHOTOGRAPHER Monthly Competition No. 24, "River Scenery." The photographs contributed are about sixty; many of them are only of moderate merit, but some are quite up to exhibition standard.

*First Prize (Silver Medal).*

ED. B. WAIN .. .. Norton-in-the-Moors.

The contribution is a delightful view of Goring on the Thames, and is titled "The Bend of the River," taken in May last year, at 4.30 p.m., with an R.R. lens, working at *f*/16, one second exposure. The print, which is on bromide paper, is really perfect. It was exposed for 45 seconds, 2 feet from a paraffin lamp, developed with eikonogen, and squeezed on to a piece of matt-surface celluloid. No one who sees this print can say a word against the use of bromide paper.

*Second Prize (Bronze Medal).*

T. GLAZEBROOK .. .. Ashton-under-Lyne.

This competitor takes second prize for a well-selected picture, "A Breezy Afternoon" (Bolton Woods). It is a good photo-

graph, carefully treated, but with clouds printed in which are rather heavy for the subject. The distance is lost by the heavy clouds printed over it. It was taken in bright light, with a lens working at *f*/32, half a second exposure being given at 1 p.m. on the 6th of September.

Other photographs calling for special attention are contributed by J. Harriman, "A Double-reefed Mainsail on Henley Reach;" A. James, "The Ford;" J. A. Booth, "Marlow Bridge;" E. R. Ashton, "Horning Ferry;" W. G. Perry, "On the River Onny;" T. Johnston English, M.D., "Whitby Harbour." These photographs will be reproduced, and all the others criticised, in the next issue of the *Photographic Reporter*.

We may add that it is not our intention in future criticisms to publish the name of the maker of either the lens or plate used, but we shall be pleased to supply that information to any of our subscribers when desired.

We understand that it is proposed to hold a photographic exhibition at Leeds. Last week a deputation from the Leeds Photographic Society, consisting of the President, Mr. Godfrey Bingley, Mr. C. H. Bothamley, and Mr. Branson, waited upon the Committee who have the management of the Fine Art Gallery, and in consequence of the representations made, they determined to recommend the General Committee to promote a photographic exhibition, to be opened some time towards the end of November or the beginning of December.

The photographic exhibition promoted by the Club of Amateur Photographers in Vienna was opened with considerable ceremony on Monday last by the Archduchess Maria Theresa. At present we have no report to hand of the photographs exhibited, but rumour says only 600 photographs were selected for the Exhibition out of 4,000 sent in. Rumour also has it that H.R.H. the Princess of Wales is an exhibitor. Amongst other exhibitors from England, we understand, are Messrs. Lyonel Clark, George Davison, J. Gale, and Alfred Maskell.

From the report sent us of the last meeting of the members of the Liverpool Amateur Photographic Association, we understand that although the expenses of the late exhibition have been very heavy, it is confidently expected that the Exhibition Committee will be able to hand over the handsome sum of £250 to the Treasurer of the Association.

The Hackney Photographic Society show a good year's work in their annual report which has just been published.

The Society has a considerable number of members, many of them very active workers, and in Mr. W. Fenton Jones they are fortunate in having an Hon. Secretary who works well with everyone.

It is difficult to understand why the Postmaster-General should take such a lively interest in class journals. At the present time he is troubled because the line, "The largest circulation of any photographic paper in the world," is printed at the top of the front page of the AMATEUR PHOTOGRAPHER. We may place it at the bottom but not at the top. The following is a rather smart paragraph upon the matter which appeared in an evening paper this week:—

"The Postmaster-General is progressing. His motto is *Festina lente*. For more than two years we learn that the AMATEUR PHOTOGRAPHER has had inscribed upon its wrapper the following statement: 'The largest circulation of any photographic paper in the world.' For two years Mr. Raikes has allowed this iniquity to be perpetrated, but now, like the villain in the Adelphi drama, he exclaims, 'Ha! Ha! Never again.' The proprietors of this useful magazine have been politely informed that such a statement is against the regulations of the Post Office. If this statement continues to be printed on the innocent blue wrapper of the AMATEUR PHOTOGRAPHER, it will be charged increased postal rates."

In our comments upon the "Challenge Cup" Competition at the Crystal Palace, it was stated that there was "only one individual prize taken in the Birmingham Society." This we find to have been incorrect, the members of the Society who were awarded prizes for their exhibits were Messrs. John Collier, B. Karleese, and J. H. Pickard. We very cordially make this correction, and at the same time have pleasure in expressing our high admiration of the exhibit of the Birmingham Photographic Society.

MANY of our readers will remember that it was determined to hold the next meeting of the members of the Photographic Convention of the United Kingdom at Bath. Through the kind courtesy of Mr. J. J. Briginshaw, the Hon. Secretary and Treasurer, we are able to give the following outline of the arrangements for the Convention week, over which Mr. W. Bedford will preside:—

- July 6th.—Reception and Presidential Address.
- " 7th.—Excursion to Chepstow and Tintern.
- " 8th.—General Meeting. Meeting of General Committee, Convention Group. Papers from 3 p.m. to 6 p.m., and 8 p.m. to 10 p.m.: "The Photographic Work of Herschel and Fox Talbot," with illustrations, W. Lang, jun., F.C.S.; "Recent Developments in Printing Processes," with illustrations, C. H. Bothamley, F.I.C.; "Recent Astronomical Photography," A. A. Common, F.R.S.
- " 9th.—Day, Excursion to Salisbury; ditto, Bristol and Clifton. Evening, "Report of the Lens Standards Committee," and "Discussion on Proposed International Standards," opened by L. Warnerke.
- " 10th.—Day, Excursion to Glastonbury and Wells; ditto, Corsham and Laycock Abbey. Evening, Dinner and Smoking Concert (ticket 5s.)
- " 11th.—Council Meeting.

Permission to photograph in the places over which they have control have been granted by the Bishop of Bath and Wells, the Dean of Wells, the Dean of Salisbury, the Dean of Bristol, the Rev. C. E. Cornish (St. Mary Redcliffe), and C. H. Talbot, Esq.

The Bath Photographic Society will place their meeting-room and dark-room at the service of the Convention.

The White Lion Hotel and the Royal Hotel will be the Convention head-quarters during the meeting.

Given fine weather, the members of the Convention and their friends are likely to have a glorious week. The neighbourhood of Bath is so picturesque, the scenery and places of interest are so varied, that there will be many photographic remembrances of a week spent in the city. The Bath Photographic Society will, we are sure, help the visitors, and in the Council of the Society, and amongst the

members will be found many enthusiastic and ardent workers who will gladly welcome their brother craftsmen from afar.

WE publish in another column a letter suggesting the formation of a photographic society at Streatham. There are, to our own knowledge, several first-class workers living in the district, and we should say that Mr. Gould will have ample support.

Mr. W. LAMOND HOWIE, the winner of the Second Prize in the AMATEUR PHOTOGRAPHER Lantern Slide Competition No. 4, writes: "I am very pleased to have reached the point of public recognition with my photographs, and hope, now that I have got a foot on the ladder, to keep rising. Thanking you for these and other competitions you have inaugurated, which, besides enabling us amateurs to measure ourselves, certainly prove an incentive to ever improving work."

SOME few complaints have reached us from owners of "dark-rooms" as to the manner in which some of those who have been introduced by us have left the apparatus, etc., placed at their disposal. This is inexcusable and much to be regretted. We shall be glad if those of our subscribers who avail themselves of the privileges extended to them will conduct their photographic operations in a stranger's dark-room with the same care that they would expect a stranger to use in their own room. This year we have not included in our "List of Dark-rooms" the hotels named in the "Cyclists' Touring Guide," but we shall be pleased to add the name of any hotel which has a dark-room to our list, and shall be particularly obliged if subscribers to the AMATEUR PHOTOGRAPHER who in the course of their travels put up at hotels where there are dark-rooms, will kindly notify the fact to us, and we will at once communicate with the proprietors.

WE had quite hoped to have published the full list of references to back numbers of the AMATEUR PHOTOGRAPHER which contain items of interest to the tourist-photographer, such as articles, or letters on "Holiday Resorts and Photographic Haunts," or Answers to Queries which have appeared from time to time, but we found the work to be so heavy that it was impossible to have the "Tourist's Index" ready for this issue.

THE Hon. Secretary of the Oldham Photographic Society has sent us a card of the Society's "Rambles" for 1891, which commence on the 10th of May, and continue at frequent intervals till the 22nd of August. The card is embellished with a beautiful portrait of the President, Mr. T. Heywood, with reproductions of, we presume, some of his latest photographic work. This is not the first photographic souvenir the Oldham Society have distributed to their members.

WE were pleased to note the following paragraph in the *Pall Mall Gazette* of the 4th inst.:—

"Photography is becoming popular also among schoolboys, 'who are very like politicians, after all.' We hear of a competition, organised by the AMATEUR PHOTOGRAPHER, open to boys under seventeen years of age. There will be four classes in this competition—landscape, portraits, animals, and architecture. Silver and bronze medals will be the prizes in this 'Public Schools Competition.' Doubtless a change will come o'er the colour of the dream of 'the whining schoolboy, with his satchel and shining morning face,' with these inducements to photographic fame."

A SUNNY afternoon was an additional attraction for "everybody who is anybody" to throng the marble vestibule of the New Gallery at the private view last week. Passing through the Central Hall, "where the silver fountain falleth," one saw Mrs. Oscar Wilde, Lady Coleridge (accompanied by the "Lord Chief"), Mrs. Bernard Beere in pale grey silk, Lady Colin Campbell, Miss Dorothy Dene, looking unruffled by her legal contest with her dressmaker, and Mrs. Comyns Carr, in a shot-silk costume of violet and green. There was quite a crowd of artists, including Mr. Shannon, whose pictures attracted much notice, Mr. G. H. Boughton, A.R.A., Mr. Val Prinsep, A.R.A., Mr. Ernest Waterlow, A.R.A., Mr. John Brett, A.R.A., and Mr. J. MacWhirter, A.R.A. "Literary gents" were present in the persons of Mr. Geo. Augustus Sala, Mr. Henry James, who is a faithful "private viewer," Mr. Lecky, and Mr. Norman McColl (of the *Athenæum*). Some M.P.s looked in for a little while, including Mr. John Aird, whose art treasures are described in this month's *Art Journal*, Sir Edward J. Reed, K.C.B., M.P., whose son's drawings are shown in the balcony, and Sir A. K. Rollit, M.P. Mrs. John Wood, the popular actress, went carefully round the rooms, and other representatives of the drama were Mr. Hare and Mr. Corney Grain, whom one does not see at picture galleries. Of course, some of the gowns were charming, and few could be considered as lacking in good taste. A lady in apple-green satin attracted almost as much attention as Mr. Burne-Jones' picture, round which there was always an admiring crowd.

THE Camera Club soirées is announced to be held at the Club House on Monday, the 25th inst., at 8 p.m. The house will be thrown open to visitors, and many will doubtless accept the hospitality of the Club. From the Club Journal we take the following paragraph:—

"The function will be a special celebration of the completion of the premises fit for inspection and general comfort. The programme of the evening will consist of a musical entertainment, with a lantern exhibition in the Club-room, and a show of turning and other amateur mechanical work by members in the lathe-room. Other minor attractions will also be added, including stereoscopes and microscopes, and, if possible, the phonograph, which will be placed in the library. All the rooms will be on show, from the studio to the basement laboratories. Ladies are invited to the soirée, but as the large room will not accommodate an unlimited attendance, the number of visitors will have to be restricted. Admission for invited visitors will be strictly by ticket. Members will, of course, not require tickets. Owing, therefore, to the limited accommodation referred to, not more than 150 visitors' tickets can be issued. These will all be for ladies, and each member applying before the limit is reached, will be entitled to one lady's ticket."

We understand that the present exhibition of photographs (members' work) is open to the public on presentation of visiting card, and that the Club servants have instructions to show gentlemen over the house. All the appointments of the Club are most complete. More members are wanted, and we should strongly advise those who are interested in photography and photographic matters to join the Camera Club. Country and foreign members have now very distinct advantages—a splendid club house, with the best photographic library in the world, most admirably arranged dark-rooms, enlarging room, studios, workshops, etc., dining-room, billiard-room, access to all the photographic journals, and the opportunity of meeting and discussing with the most prominent workers in photography. The Club is most conveniently situated in the very heart of the West End, and is, therefore, in every sense a rendezvous for the provincial worker in photography, which will serve his purpose from the art, practical, or social side of photography. We venture to say that no other art or science has raised for itself in so short a space of time such an

institution as the Camera Club, which now numbers more than 700 members.

### HOME PORTRAITURE.

By request from several of our readers we break the continuity of our notes on the above, and now treat of the development of the plates.

The main point for which all our notes have been contending, and which we must not lose sight of in development, is reduction of contrast and the production of soft, harmonious negatives. There are practically four developing agents open to us—ferrous oxalate, our old and dirty friend pyro, hydroquinone, and, lastly, the new comer, eikonogen. Few of us use ferrous oxalate now, and we shall not waste time in considering it, so we have only the three left. We shall now make a statement which will doubtless be received very variously by our readers, and that is *that hydroquinone is utterly unsuitable for developing home portraiture negatives*. We will now proceed to give our reasons for making this statement. In the first place we have a tendency in the lighting to exaggeration of contrast; secondly, hydroquinone has a tendency to give excessively dense high lights and glassy shadows; thirdly, not one amateur out of a hundred of those using hydroquinone knows how to use it. These statements are made not without due deliberation, and are the result of many months' personal work, and also of seeing a great number of portraits by our various correspondents developed with hydroquinone, and it has almost become a bye-word in the criticism of prints by us, "Oh, another hydroquinone monstrosity!" and this without seeing any data as to development. It must be clearly understood we do not state that hydroquinone cannot be used for this work, only that it requires a great deal more experience and a great deal more "brain" than is generally supposed. Hydroquinone development is the most difficult to learn, the most difficult to control, and is of value only to the expert hand.

Pyro is, and has been, the mainstay of portraitists for many a day, and the best formula to use we consider a plain pyro and ammonia developer, compounded on the lines of Edwards's well-known glycerine developer, which is noted for giving soft, delicate results. The following is the actual formula we use:—

	(A.)	
Pyrogallol . . . . .	1 oz., or 437.5 gr.	
Citric acid . . . . .	40 "	
Glycerine . . . . .	1 oz.	
Methylated spirit . . . . .	to make 9 oz. 1 dram.	
	(B.)	
Liq. ammon. fort '880 . . . . .	1 oz.	
Distilled water . . . . .	to 10 "	
	(C.)	
Ammonium bromide . . . . .	48 gr.	
Distilled water . . . . .	to 1 oz.	

(All these are 10 per cent. solutions.)

To make the developer, take 1 gr. of pyro = 10 minims of A, 2 minims of ammonia = 20 minims of B,  $\frac{1}{2}$  gr. of bromide = 5 minims of C, 1 oz. of water. One ounce of developer is sufficient for a quarter-plate, two ounces for a half-plate. Do not use slow development. Mix the whole of the developer in a cup or measure, and flood the plate with it at once. Do not wet your plates first. Rock your dish. If after developing some little time the high lights are dense but the shadows weak, pour off your developer, fill the dish with water, put it on one side with a cover over it for half an hour, and do something else. Never forget that *increase of pyro and bromide means increase of contrast*, lessening of pyro and bromide and increase of ammonia means decrease

of contrast. Do not use soda or potash for the accelerator, but if this is actually preferred, use the following:—

Carbonate of sodium (pure)	..	..	1,200 gr.
Caustic potash	..	..	150 "
Distilled water	..	..	to 10 oz.

Use one drachm of this to every ounce of developer. Use as little sulphite as possible.

Eikonogen is *par excellence* the developer for amateur portraiture work, and one of the simplest and one of the best one-solution formulæ is that of Warnerke:—

Sodium sulphite	..	..	40 parts
Hot distilled water	..	..	100 "
Eikonogen	..	..	10 "
Caustic potash	..	..	10 "

For use, mix 1 part of this with 9 or 10 parts of water.

Another formula, and one that we prefer, is the following by Dr. J. J. Acworth:—

(A.)			
Eikonogen	..	..	5 parts
Sodium sulphite	..	..	10 "
Distilled water	..	..	100 "

(B.)			
Caustic potash	..	..	5 parts
Distilled water	..	..	100 "

Mix in equal parts. This gives beautifully soft images without any sign of hardness.

Another formula we have used with good results is the combined "hydro cum eiko" of Mr. Chapman, of Manchester:—

(A.)			
Hydroquinone	..	..	40 gr.
Eikonogen	..	..	120 "
Sodium sulphite	..	..	480 "
Citric acid	..	..	20 "
Distilled water	..	..	20 oz.

(B.)			
Potassium bromide	..	..	5 gr.
Sodium carbonate (pure)	..	..	60 "
Sodium hydrate	..	..	30 "
Distilled water	..	..	20 "

For use, mix in equal parts.

Just a few brief tips and we have done. Always attend to the temperature of your developer. This should be 60 degs. F. Always use the acid fixing bath. Do not try for clear glass negatives, or black and white ones. Wash your negatives well, dry, and take a print from them before you decide to reduce, intensify, or otherwise fake or dodge them. Few can say what a negative requires doing to it by looking at it. Nearly everyone can tell from a toned and fixed proof though.

## Letters to the Editor.

### WHAT IS AN AMATEUR?

SIR,—The question "Amateur or professional?" has been often termed a "vexed" one in your columns. It was, however, after a flood of correspondence, settled some years ago, if I rightly remember, by yourself.

Of course, it is natural that beginners should wish to know public opinion on the matter, and a fair answer to a fair question can readily be granted. I must, however, take exception to your correspondent, when he asks, "Can these exhibitors any longer be considered amateurs, if they were so before?" I consider the doubt implied detracts from the candour of the question. It is not pleasant for myself and the other exhibitors mentioned to have their honour doubted, and the question mooted whether we had not tried to climb in the back way of the fold, and were not thieves and robbers. I suppose "An Inquirer" argued, "If they do such things publicly, what must their private actions be?"

It never occurred to me to hesitate over pricing my photographs, any more than it would have occurred to me to hesitate over pricing a horse or a pigeon sent for exhibition lest people should designate me a horse dealer or a bird fancier. Pricing one's exhibits I always considered a sort of form; when people did not wish to sell, I suppose they put fabulous prices, rather than none.

In the case of my Crystal Palace exhibit, I frankly confess I named a reasonable price to avoid paying for its return, as I can, of course, get any number of copies from my negative at a nominal cost. In a word, did not price my photographs to butter my bread—photography is not my profession—how then can I be a professional?—Yours, etc.,  
F. S. JAMES.

SIR,—The vexed and vexing question, "What is an Amateur?" has come down upon us again with periodical exactness, like the influenza, and, like that unpleasant epidemic, will probably remain an unsolved problem, notwithstanding the host of learned men and empirics who will doubtless endeavour to diagnose its symptoms and explain its characteristics.

My own idea of the distinction between a professional and an amateur, which I would not venture to advance were I not one of those "named" in the letter of "An Inquirer," is this: A professional photographer is one who produces photographs *in order to sell them*, while an amateur is one who *doesn't*, even though he should ultimately offer his wares for sale. If he prints photographs to order, and charges for them, even though it be only among his friends, I admit that he is sailing very near the wind, but if he sells what he has printed for himself but no longer wants, I think he may do so without question, just as, in the same way, if I build a boat for myself, and subsequently sell it, no one would call me a professional boatbuilder, but if I built it for sale they might.

As to the photographs exhibited by me at the Crystal Palace, they were all half-plate bromide prints, whose intrinsic value (including frames) was about 1s. 3d. each, while the price at which they were "offered for sale" was from £1 to £5. I think that the inference is obvious; nevertheless if "An Inquirer" would like to purchase them I do not mind letting him have them, even though I must henceforth consider myself a "professional"—for, *mirabile dictu!* they are still unsold!—Yours, etc.,  
May 3rd, 1891.  
G. H. P. BURNE.

SIR,—I notice in your last issue that some person who is too modest to sign his name, wishes to make out that I am no longer an amateur photographer. Perhaps he or she will allow me to differ with him or her on this point, although it is quite immaterial to me what "Inquirer" thinks on the matter. He says he *began* to investigate further. If he had *finished* his investigations, he would, perhaps, have altered the list of names he sent to you. However, I see that in the *latest* catalogue I am credited with a picture called "Lynton and Lynmouth," price 4s., which does not belong to me, but in the *first* catalogue is credited to Mr. C. Heginbotham. I beg to inform "Inquirer" that I value my pictures at a great deal more than at 4s.—Yours etc.,  
April 30th, 1891.  
LESLIE SELBY.

SIR,—An amateur is the dealers' best friend, and if I was a manufacturer of dry-plates I would present each one with a detective camera, if he would promise to use my plates solely for twelve months. An amateur is one with a hobby, and if the hobby can be made to pay for itself, so much the better for the hobby. It is said that amateurs sell their pictures to their friends, but as a rule their friends take particular good care that they don't. Is it *infra dig.* to be considered a professional photographer? A friend of mine whose "screw" is, perhaps, three times as much as mine (lucky dog!) paints a little in his leisure time and sells the pictures; and yet I, if I am an amateur photographer, must not (if I have the chance) sell mine. Happy England!—Yours, etc.,  
Liverpool.  
JAMES WOOD.

SIR,—I am pleased to see "Inquirer," in your last number, again uses the question of the status of those, so called, amateurs who sell or offer to sell their photographs. For my part, I hold that anyone who sells his pictures, whether it be for a livelihood, or to seek out some other way of earning a living, or merely to meet part of the cost of his hobby, ceases to be an amateur by thus entering, in however limited a way, into com-

petition with one or other of the various branches of the professional worker.

While on this question, I may put another case for the opinion of your readers. A gentleman, who by his talent would prove an honour to either the professional or amateur sections of photographers, takes in India a medal in classes especially declared for professionals, and in Gloucester the same exhibitor is awarded first in a class equally reserved to amateurs! Surely it is time there should be a clear understanding as to the line which should divide (at least at exhibitions) the professional from the amateur.

—Yours, etc., S. FRANCIS CLARKE, L.D.S.

May 2nd, 1891.

SIR,—Referring to the letter signed "An Inquirer," in your issue of the 1st inst., I see amongst others my name is mentioned.

I much regret this, as although I had placed a price against the frames exhibited, I had no intention of selling them. As a matter of fact, these particular pictures were *given* away before the exhibition opened. In filling up the entry form I fixed a price more by way of a joke. It did not occur to me at the time (although it did afterwards) that I was in any way compromising myself, or helping to reopen the much vexed question of amateur v. professional.—I am, etc.,

W. H. WHITTARD.

#### EXPLOSION OF A REGULATOR ON AN OXYGEN GAS CYLINDER.

SIR,—I do not think Mr. Brandreth gives sufficient particulars. He does not say whether the hydrogen had been turned on and afterwards turned off while the leak in the oxygen side was being remedied. It is most unusual to turn on the oxygen first; if this is done, a little oxygen is almost sure to get into the hydrogen tubes, sufficient to cause them to blow off when a light is applied to the jet, more especially if a dissolver is used.

Within the last four weeks there have been three explosions with oxygen cylinders while being tested with a gauge: (1) One caused serious injury to the operator, who has been laid up a month. (2) Another operator had the end of the steel tube in the gauge blown off, and lost all the gas; no other damage. (3) Operator had his hand seriously burnt by the ignition of the leather washer between the cylinder and the gauge; the gauge did not actually explode.

These explosions could not be caused by mixed gases; the cylinder in each case was connected only to the gauge, which had never been used for hydrogen; but were caused by the great pressure being suddenly checked at the end of the steel tube in the gauge, which is too small to possess sufficient elasticity to withstand the sudden pressure.

Mr. Brandreth had turned the gas on and off several times with the tap at the jet turned off. The bellows would remain open unless the leak were very large, consequently the valve of the regulator would be closed.

Now here we have exactly the same conditions as when the quantity of gas in a cylinder is tested by means of a gauge. The small quantity of gas between the valve of the gauge and the valve of the cylinder had leaked out. When the valve of the cylinder was again opened, possibly very quickly, the gas rushed with great force against the closed valve of the regulator, which gave way. The flame was caused by the india-rubber, or possibly some portion of the metal work, igniting with the friction.

Should this be the cause of the explosion, the remedy is simple: never turn on the gas from the cylinder unless you are sure the regulator has been emptied either by removing and replacing the india-rubber tube or turning on the top of the jet.—Yours, etc.,

April 29, 1891.

C. GOODWIN NORTON.

\* \* \* \*

#### DISTINGUISHING COLOURS.

SIR,—I observe in your columns a statement quoted from an African traveller to the effect that certain tribes are only capable of distinguishing three colours—white, red, and black—and the proof of this is said to be the "best possible," viz., the absence of names for other colours. A similar argument has been urged by eminent scholars to prove that the Homeric Greeks were very deficient in the sense of colour, and in general that the colour sense is of late development. The argument is, however, worthless. Names are not given until they are wanted for the purpose of communication, and names of colours are, generally speaking, not wanted until the pigments or dyestuffs, etc., become objects of commerce. Of late years our colour vocabulary has been

enlarged by the addition of such names as mauve, magenta, etc. <sup>18</sup> This because our colour sense is more developed and that we were until recently incapable of distinguishing these colours? Not at all; but because the dyes have been introduced into commerce. What a vast majority of our population have no words but blue, green, red to designate a vast variety of shades, which, nevertheless, they are perfectly able to distinguish. The names orange and violet as names of colours are indeed comparatively modern, and many others. Even those whose business compels them to find definite names for a great variety of tints are driven to such combinations as "English grey," "Dutch grey," "French grey," "Indian grey," "pale grey," "neutral grey," "silver grey," for seven wholly different colours. So there is "pale green," "blue green," "dark sage green," "pale sage green," "deep green," etc. Is a person who is unacquainted with these specific names, and uses only the generic "grey," "green," to be considered incapable of distinguishing the many colours so named? By the same argument, posterity may prove that we are incapable of distinguishing smells except as sweet, nasty, or pungent, and tastes except as sweet, sour, bitter, acid, and, perhaps, one or two more.

The argument from the absence of names has some value when applied to animals or plants, useful, noxious, or otherwise interesting, but not when applied to sensations.—Yours, etc.,

X. Y. Z.

#### WHAT IS MEANT BY THE TERM "INSTANTANEOUS" AS APPLIED TO PHOTOGRAPHY.

SIR,—I was very glad to see Mr. Meldon's letter on the above, as I think it is at present a point which is very far from clear. I think it is manifestly unfair that difficult "instantaneous" work, such as pictures of athletic contests, horse racing, etc., should be judged in the same class as work which only required perhaps one-tenth of a second exposure, as against at least one-three-hundredth or one-four-hundredth of a second in the former case. To be eligible for an "instantaneous" class, I think the picture should be such that the principal object is manifestly an object in more or less rapid motion, and on this ground I would not allow such pictures as cattle studies to compete against genuine rapid work, simply because the cattle may or may not have been whisking their tails about during the exposure. I also think that sea work ought always to be in a class for itself, as it is by far the easiest work which has any claim to the term "instantaneous." I should also like to know exactly what constitutes a picture which is eligible for a "hand-camera" class.—Yours truly,

May 4th, 1891.

W. B. MACCABE.

\* \* \* \*

#### SOCIETY FOR STREATHAM.

SIR,—In common with several friends interested in photography, I am anxious to see whether it be not possible to start a Streatham Camera Club.

At present, I believe, nothing of the sort exists within two or three miles, and as there are evidently a large number of amateurs living in this neighbourhood, I feel sanguine that the idea will meet with general approval.

Several friends to whom the proposal has been made have already expressed their desire to help in forming such a club, and it has been suggested that I should ask you to lend us your powerful aid in making the affair public.

As soon as a sufficient number have agreed to join, a meeting will be held to fix the subscription, etc.

In the meantime I should be glad to hear from any to whom the idea commends itself.—Yours, etc., REGINALD C. GOULD.

Woodlawn, Leigham Court Road,  
Streatham, S.W., May 3rd, 1891.

\* \* \* \*

#### THE EXHIBITION AT BRIXTON.

SIR,—I notice an omission in your account of our exhibition in this week's issue which I will thank you very much to rectify in next week's paper. I refer to the omission of the name of one of the judges, viz., Mr. F. W. Edwards, the popular President of our neighbouring society, the South London, who, at some trouble to himself, kindly acceded to our request that he would assist Messrs. Traill Taylor and A. R. Dresser.

Just a line to correct this inadvertency will greatly oblige.

—Yours faithfully,

May 2nd, 1891.

F. W. LEVETT.

NOTE.—We of course gladly publish this correction.—ED: AM: PHOT:

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER IX.

*Figs. 18, 19.*—P. De Laer, from his long residence amongst the Italian painters, has constructed most of his pictures, though generally in the low walks of art, on the most regular and severe principles of their grandest compositions. As this regularity is considered by some to be incompatible with the negligence of arrangement which they suppose necessary to the picturesque, I shall here make a few observations on that doctrine. I consider it to be false, and not tenable, when referred to the operations of nature; for we find her conducting and exhibiting the most beautiful appearances and effects in the humblest and most trifling of her works, by the same laws that regulate her in the formation of the most sublime. Abernethy says, "That work is beheld with admiration and delight, as the result of deep counsel, which is complicated in its parts, yet simple in its operations, where a variety of effects are seen to arise from one principle operating uniformly." When we refer

FIG. 18.—P. DE LAER.

to the great masters in poetry, we find that the Idyls of Theocritus are not less regular than the Iliad of Homer; or the Georgics and Eclogues of Virgil than the Eneid. The English pastorals have failed in giving pleasure, not by the regularity of their construction, but in consequence of their not being founded on truth; the language and scenery not being that of nature in such situations.

Let me here caution the student against supposing that I mean grossness and vulgarity as proper accompaniments in his representations of common nature; he must convey such scenes to us with the appearance of their having passed through a susceptible and amiable mind, anxious to render nature agreeable, not to make her disgusting.

In the works of the best painters in the lower walks of the art, there are numberless examples of this regularity. Even Wouvermans, whose soft and delicate touch seems ill-suited to severe regularity of form, or light and shade, has received an advantage by its adoption; his best pictures being founded on the simple construction of his rival. A regular form can always be rendered sufficiently irregular by the means of light and shade; and if P. De Laer's pictures possess this property of light and shade too decidedly for such a purpose, we must recollect that from his painting upon a dark red ground (as was used at the time by many of the Italians) his works often look harsh; the lights, from

being thickly painted, having resisted the influence of the ground, while his half tints are absorbed and indented in the shadow.

As the student will have occasion to refer to the prints after the different designs here given, I beg leave to remark, that, in most of the Italian prints which I compared with

FIG. 19.—P. DE LAER.

the original pictures, I found the characteristic points often not attended to. The strong lights wanted their value, either from the shadows being deficient in their proper strength and quietness, or from the introduction of aerial perspective (a circumstance seldom influencing the conduct of the great masters either of the Italian or Venetian schools), or from the manner in which the strong darks and lights were brought in contact. I believe sufficient has already been written on engraving, nor am I against its being considered a liberal translation; the beauty of lines is perhaps the only substitute engravers can give for the absence of colours; but surely it is not too much to request that a strong red or a strong blue (however ornamented

FIG. 20.—CORREGGIO.

by lines) be referred to its proper scale, either as the extension of light or the production of shadow. These errors seem to have arisen from contemplating the picture in the twilight for the more easy detection of the light shade; a most fallacious method; for, in such case the most projecting and the most retiring colours are rendered similar.

*Fig. 20.*—As in figure 17, we may observe this form influencing the arrangement of the whole group; we have here the heads composed on the same principle, and repeating each other with a simplicity which is safe only in the hands of the best painters. I have mentioned regularity as a quality to be found in the most sublime subjects in painting; but to infer from that, that regularity constituted sublimity were as absurd as to say irregularity constituted the picturesque.

Here we have examples, in figs. 18 and 19, of strictly formal composition applied to common subjects, and the art is so good that it is scarcely visible except to the practised eye. Art is always the more perfect, with qualifications I have already mentioned, in the degree in which its impression is made by means that do not court notice. By way of contrast, in fig. 20, we have a noble subject treated on exactly the same principles, showing that art is the same however its subjects may differ. This latter sketch may afford suggestions for a family group, less formal than those too often presented by the photographer.

In condemning the method of the engravers of contemplating pictures in the twilight for the more easy detection of the arrangement of light and shade, our author might have been referring to the modern practice of some artists who indulge in the affectation, when they are studying a view, of half shutting the eyes, as though they could see better when partially blind than when in full possession of their faculties. The student may be quite sure that he will do better if he will learn to see and judge with his eyes open, than to persuade himself that he sees more clearly with them half shut.

(To be continued.)

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XV.

LENSES CONSIDERED AND CLASSIFIED WITH RESPECT TO THEIR CAPABILITIES FOR INSTANTANEOUS WORK.

THE fathers of photography were greatly troubled and hindered in their work by the want of suitable lenses. The first lenses by which a picture was ever obtained by the agency of light were those of the "solar microscope." Writing in 1802, Davy (the great chemist) remarks,—“The images formed by means of a camera obscura have been found too faint to produce in any moderate time an effect upon the nitrate of silver. To copy these images was the first object of Mr. Wedgwood, in his researches on the subject, and for this purpose he first used the nitrate of silver, which was mentioned to him by a friend as a substance very sensible to the influence of light; but all his numerous experiments, as to their primary end, proved unsuccessful. In following these processes I have found that the images of small objects, produced by means of the solar microscope, may be copied without difficulty on prepared paper. This will probably be a useful application of the method; that it may be employed successfully, however, it is necessary that the paper be placed at but a small distance from the lens.”

For Davy, then, can be claimed the honour of being the first to produce an image upon a sensitive surface, by means of light acting through a glass lens.

Singularly enough, another famous pioneer of photography, Joseph Nicéphore Niepce, employed\* “the lenses of the solar microscope, which, as you know, belonged to our grandfather, Barrault,” in the production of his earliest camera pictures in 1816. It is even believed to have been the want of suitable lenses of his own which largely induced Niepce to enter into partnership with Daguerre in 1829. Daguerre

had “periscopic” lenses, made according to the plan of the English scientist, Wollaston, and obtained through Chevalier, the well-known Paris optician. But even Daguerre’s early lenses were what we should consider as extremely imperfect. Their visual and chemical foci did not agree; and they could only be used with a small stop, about  $f/30$  at least.

After the publication of Daguerre’s and Talbot’s discoveries in 1839, improvements in lenses were made rapidly. The first to call attention to the need for harmonizing the visual with the chemical focus of any lens used for photography was J. T. Towson, of Liverpool, in 1839.\* It may be here stated that the differently coloured rays of light are bent or refracted to a different extent when they pass through any prism or lens; the red rays being bent the least, and the violet rays the most. Now we have already explained that we see objects principally by the aid of the yellow rays, which are the best able to affect the fibres of the optic nerve which are distributed over the retina or sensitive layer at the back of the eye. But the blue, violet, etc., rays, which mainly affect our dry plates, are bent, or refracted, or brought to a focus nearer to the lenses than the yellow rays. Thus if we use a simple convex spectacle lens in a camera, we get a blurred image on the plate, although the image on the focussing screen looked quite sharp. This was the defect pointed out by Towson; and the early workers remedied—or rather endeavoured to remedy—it by moving the plate nearer to the lens after focussing, or by having the dark slide so made that the plate and the focussing screen occupied different planes. With a convex spectacle glass and using a stop about  $f/20$ , it will be found that fairly sharp pictures can be obtained if the plate is moved towards the lens, for from the one-thirtieth to the one-fortieth of the focal length of the lens, after focussing. Thus, if the focus of the spectacle-glass be ten inches, the lens must be moved forward one-fourth of an inch fully.

*The First Rapid Lens.*—Although portraits of living beings were obtained by the daguerreotype process as early as 1840, by Morse in New York, yet when we say that they necessitated an exposure of twenty minutes in bright sunshine, it is sufficient to show that the results were worthless, except as a curiosity. In the same year, two Americans, named Wolcott and Johnson, patented a camera in which a mirror was used instead of a lens. They sold their invention to one Beard (who had purchased from Daguerre the right to work the daguerreotype process in England), and with this reflecting camera and the use of bromine as an accelerator the first really successful portraits were taken in London in 1841. Beard was originally a coal merchant; he made over a hundred thousand pounds out of his daguerreotype rights; but lost it all in speculations. One other English photographer, Claudet, also held a license direct from Daguerre.

During the years 1839-41, everywhere in Europe, the daguerreotype process was being tested, and the demand for better lenses was great and urgent. As is commonly the case, the demand produced a supply.

The necessary mathematical calculations to discover the curves and ratios necessary for a lens which should bring to the same focus the blue and the yellow rays, and which should also possess a wide aperture in proportion to its focal length (retaining at the same time tolerable flatness of field and good definition), are extremely abstruse, and present very difficult problems. But Professor Petzval, of Vienna, succeeded in 1841 in devising the necessary combinations of flint and crown glass; and the German optician, Voigt-

\* See letter from Niepce, written at Chalons to his brother Claude, then residing at Kew.

\* “On the Proper Focus for the Daguerreotype,” *Philosophical Magazine*, vol. xv., p. 381.

lander, manufactured in that year the first "portrait lens," which has remained practically unaltered as a standard down to our own days.

I. *The Most Rapid Lens Made.*—In the old wet collodion days the work of photographing babies and young children was anything but a source of pleasure to the operators. It may be said that it is scarcely so yet. But the advent of the gelatine dry-plate has enabled the rapidity of studio exposures to be immensely increased, and the liability of the subject moving during the exposure has been in a like degree decreased.

Perhaps the "baby lens" made by the late J. H. Dallmeyer\* was the most rapid lens ever constructed. Its aperture was fully  $f/2$ , that is, the diameter of the lens was as much as one-half the focal length, a lens of only six inches focus being three inches in diameter. Of course, the field of view of such a lens was very restricted, being not more

FIG. 1.

sacrificed to rapidity. It was, moreover, a very expensive article.

II. *The Portrait Lens in Instantaneous Photography.*—The "portrait lens," properly so called, has its largest aperture equalling  $f/4$ ; that is, a portrait lens of ten inches focal length has its largest stop  $2\frac{1}{2}$  inches in diameter. It is also long (*i.e.*, the lenses forming it must be placed several inches apart), and its mount is necessarily large and heavy. For these and other reasons a portrait lens seldom finds favour with the "sly snap-shooter" of the present generation. But it is easy to imagine work in which the extremely large aperture ( $f/4$ ) of the portrait lens would enable its possessor to obtain results which would otherwise be impossible. Mr. Traill Taylor, when depicting life as it exists on the doorsteps and in the gutters of the purlieus of Drury Lane, found a portrait lens of great value. Still, for the average worker, the portrait lens is merely a "white elephant." We may add that it is very costly.

(To be continued.)

## Photographic References.

By MAJOR J. FORTUNÉ NOTT.

### DEVELOPMENT.

(Continued from page 247.)

In continuation of the subject of the pyro-ammonia developer, it now becomes necessary to specify a formula and its method of preparation:

No. 1.			
Pyrogallie acid	.. ..	$\frac{1}{2}$ oz. (240 grs.)	
Sulphite of soda	.. ..	2 " (960 " )	
Water .. ..	.. ..	$\frac{1}{2}$ pint (10 oz.)	

No. 2.			
Ammonia .880..	.. ..	$\frac{1}{2}$ oz. (240 minims)	
Water .. ..	.. ..	1 " (480 " )	

No. 3.			
Bromide of potassium..	.. ..	2 drms. (120 grs.)	
Water .. ..	.. ..	$\frac{1}{2}$ oz. (240 minims)	

No. 1 solution should certainly be made up with distilled water, or, as before remarked, when this is not procurable, the water should be boiled and then allowed to get cold. The sulphite should be dissolved first, then the pyro added, and the bottle should always be kept well corked.

No. 2 solution should be used in a dropping bottle. By testing, it will generally be found that these bottles allow rather large drops to escape, which, by measurement, will be found to contain  $1\frac{1}{2}$  minims, instead of 1 minim, as is generally supposed. Therefore, each drop of this solution will contain  $\frac{1}{2}$  minim of ammonia. If the make of bottle used does not allow so large a drop to pass, then allowance should be made for this fact in the proportion of water originally used in making the solution. The object of keeping it in a dropping bottle is to insure the ammonia against the loss of strength that takes place every time the cork is removed, which is necessary if this solution is made up for use in the ordinary way.

No. 3 solution is the ordinary restrainer, which should again be kept in a dropping bottle, but one of a different pattern, so that in the dark it can be recognised by the feel, and consequently confusion between it and the ammonia bottle avoided.

For use under ordinary circumstances the developer should be mixed as follows:—

1 drm. of No. 1 ( <i>i.e.</i> , 3 gr. pyro),
$1\frac{1}{2}$ oz. of water,
4 drops of No. 2 ( <i>i.e.</i> , 2 minims of ammonia),
1 drop of No. 3 ( <i>i.e.</i> , $\frac{1}{2}$ gr. of bromide).

Of course, when the knowledge regarding the action of each of these constituents has been acquired, the proportions can be varied to suit the requirements of each negative. If more density is necessary, the amount of No. 1 must be slightly increased, and if traces of under-exposure become evident, the amount of No. 2 may be increased; but this should be done very carefully, and by single drops at a time, and the developer should be given time to act. Under nearly every possible circumstance a tentative method of development is the one to be preferred, and a beginner should accustom himself to this mode of procedure. Its advantages are numerous.

A good all-round soda developer is the one which the Eastman Company recommend for use with their films. We quote it herewith:—

Pyrogallie Solution.			
Pyrogallie acid	.. ..	$\frac{1}{2}$ oz.	
Sulphuric acid..	.. ..	20 minims.	
Water .. ..	.. ..	32 oz.	

Soda Solution.			
Sulphite of soda	.. ..	6 oz.	
Carbonate of soda	.. ..	4 "	
Water .. ..	.. ..	32 "	

Care should be exercised in mixing this solution, especially with regard to the purity and correctness of the ingredients. The sulphite should be pure and not sulphate. The carbonate of soda should be in clear crystals, and bicarbonate of soda should not be used by mistake.

Restrainer.			
Bromide of potassium	.. ..	1 oz.	
Water .. ..	.. ..	6 "	

The developer for use is made as follows:—

\* I had the honour to write the life of Dallmeyer for the "Dictionary of National Biography," and conceived a great respect for the clever German "master-hand," and for his no less able father-in-law, the late Andrew Ross.

Pyro solution	..	..	..	..	1 oz.
Soda solution	..	..	..	..	1 "
Water	..	..	..	..	2 "

This developer can be used for the stripping films as well as for all other kinds of films and plates. The colour of the negatives resulting from its use, although not quite so clear-looking as those produced by ammonia, will, nevertheless, be found to possess very good printing qualities.

If potash is preferred to soda, then the following mixed formula can be used, and for certain brands of plates it is one that can be used with advantage. In its power of forcing out detail quickly, potash probably ranks next to ammonia among the variations of developers made with pyrogallol.

No. 1.					
Sulphite of soda	..	..	..	..	6 oz.
Water	..	..	..	..	32 "
Pyro	..	..	..	..	1 "
No. 2.					
Carbonate of soda	..	..	..	..	3 oz.
Carbonate of potash	..	..	..	..	1 "
Water	..	..	..	..	32 "
For use take—					
No. 1	..	..	..	..	1 oz.
" 2	..	..	..	..	1 "
Water	..	..	..	..	2 "

and add a few drops of bromide solution.

The method of procedure with any of these developers must be referred to for the benefit of those beginners who may be on the point of making their first attempts at development. All the necessary dishes, jugs, and glass measures should be clean, and a broad camel-hair brush should be provided, which should receive a good preliminary washing on every occasion when its services are required. The developer should be mixed just before the light is turned down, and as it will not keep long before commencing to deteriorate, no time should be lost afterwards in using it. The bottles, trays, and other requisite appliances should be placed where they can be seen by the dim light of the ruby or yellow lamp. The plate on being taken from the plateholder should be dusted with a dusting brush, and then placed in a dish of water. Care should be taken to see that there are no air-bubbles or greasy spots that repel the water or prevent it flowing readily over the surface. To insure this fact, the developing brush should be lightly passed over the surface while the plate is below the water. After a minute's soaking the water should be drained off and the mixed developer poured over it in a steady and even manner; the tray should then be kept in motion so that the rocking, which should be of a gentle character, causes the developer to flow steadily backwards and forwards. But at the very outset the brush should again be passed over the whole of the surface to remove any air-bubbles that may have formed and would, if not removed, cause spots of a more or less serious nature to be apparent in the negative. A strange thing about development is that now and again air-bubbles will manifest themselves, and if not immediately removed the developer seems subsequently to refuse to act upon those places, although they may have been detected at an early stage of the development. The first thing to watch for in the negative is the speed with which the high or intense lights begin to show themselves; by this sign some information regarding the nature of the exposure can at once be formed, and if it has been too prolonged or too short, then the developer should immediately be poured back into the measure or developing cup ready for the purpose, and the alterations requisite to meet the case should at once be made. But directly the

developer has been removed the plate should be thoroughly washed so as to prevent as far as possible any continued action of the chemicals. To some extent this cannot be prevented, but speed in mixing the fresh developer or adding to the old one is very essential. A good dose of restrainer may save an over-exposed plate if it is added very quickly and is followed by a developer very much weakened.

(To be continued.)

## Thursday Evenings at the Camera Club.

(BY ONE OF OUR STAFF.)

MR. LYONEL CLARK presided at a very interesting meeting on the 30th ult., though the attendance was not so large as the occasion deserved. Previous to the commencement of the principal business of the evening, Mr. Davison showed some clear gelatine intended to be used for lantern slides.

Mr. J. Traill Taylor then proceeded to read his paper on "Lantern Optics." Dealing first with the radiant, he assumed the use of the limelight, and said that by repeated experiments he had come to the conclusion that two inches from the condenser might be considered a safe position for the light. When, however, the lenses did crack, the fault was due either to cell binding, too sudden approximation of the light, or currents of cold air on the lenses. To strengthen the lenses to meet the latter danger, they might be placed in cold water and gradually heated to boiling point, and then allowed to cool gradually. If some saline matter were put in the water, or if oil were used, the effect was much better. The functions of the so-called condenser were first of all to collect the rays from the radiant and then to condense them on to the slide. Of these two points the first was the most important, for what was desired was to collect the rays from as large an angle as possible and to project them forward in as near an approach to parallelism as possible. Absolute parallelism could not be obtained unless the radiant were an absolute point. Some of the cheap French lenses had done excellent service and were marvellous at the price, but those he had tested—and they were few—had failed to allow their whole surface to be utilised, and did not transmit all the light falling on their anterior surface. They transmitted an angle of from 40° to 50°, and the higher class of London made lenses claimed to embrace 60°. By a slightly increased expenditure of optical materials it was possible to increase the angle to 95°, which would more than double the intensity of the illumination. For that purpose they must have at least two lenses; the one nearest the light must be  $4\frac{1}{2}$  in. diameter to catch 95°, and should not be particularly thick. The lenses he was going to describe were not in use in this country, or in any European countries so far as he was aware, though they were the most perfect, practically and theoretically; they were used in the colleges and universities of America. The first lens was a thin one of  $4\frac{1}{16}$  in. radius, which apart from any optical advantage would enable it to bear the impact of the light, but it must be set very loosely in its cell. The test of a well-set condenser was that if the mount were given a sharp circular twist the lens would go on revolving afterwards. That lens was only 16 millimetres thick in the centre, and was formed by preference of flint glass. The second lens was 5 in. diameter, and its radius of curvature being rather shorter, combined with its larger diameter, made it proportionally thicker—28 millimetres. The loss of light by it was very little; not worth noticing. The loss by oblique incidence was very small, and that could be reduced by making the first surface slightly concave. At one time he was in love with meniscus lenses for that purpose, but was now of opinion that the plane surface performed every service in a practical manner. These two lenses should be mounted as closely as possible together, and if possible fixed permanently in the lantern and always used together. With that collecting system he polarised light with one sheet of green glass instead of the twelve generally used. These lenses collected the rays and projected them practically parallel. As to the condensing system, that was separate and should be movable, and selected to meet the particular end in view, so that one might have a set of condensers for various

purposes. The lens might be plano-convex, especially for long-focus objectives, but if for short focus it should be of crown glass, and of the crossed form in which the curves were as one to six, or two to thirteen, which latter ratio was to be preferred. The rays of this condenser were desired to come to a focus in the vicinity of the objective. Dealing as they were with practically parallel rays, it was impossible to imagine that a condenser fitted for an objective of 12 in. focus would do equally well on one of 6 in. For an objective of from 12 in. to 15 in. focus, the condenser should be plano-convex with a radius of 7 in.; for 8 in. to 10 in. the radius should be 4½ in.; and for 6 in. to 8 in. the radius should be 4 in. Condensers should be treated with the most scrupulous care in heating and cooling, currents of cold air should be avoided, and if they were loose in their cells a fracture would seldom occur. As to the objective, the image-former, the diameter of its posterior lens should be a little larger than was necessary to take in all the rays for the condenser. It was very largely immaterial where the cone of rays fell so long as it was all included in the objective. By experiment, the late Mr. J. H. Dallmeyer, Dr. Monckhoven, Mr. Byles, and himself had found that there was no difference observable, whether the apex of the cone fell on the front lens or between the two lenses. It was, however, scarcely advisable to have it fall on the front lens, as the heat given off by the radiant was very great, and might discolour the Canada balsam with which the lens was cemented. There was also another reason: glass was very sensitive to light, and greatly deteriorated under the influence of strong light. The back lens of the objective being larger than necessary, would collect the rays reflected from the image itself; it also enabled it to be brought nearer the light, which was an advantage with the ordinary condensers. The lens tube should be longer than that used for photographic purposes. If photographic lenses were employed for the objective they should be of the carte-de-visite form, which were corrected for flatness of field, even if there were slight astigmatism.

Commander Gladstone opened the discussion with the observation that to his mind the chief point in the condenser was the glass of which it was made, for very few people appreciated the loss of light in passing through green glass condensers. Besides, if the slide were of small diameter, and in close contact with a 5 in. condenser, not nearly the whole of the light would be utilised. He had no doubt, however, that the system the reader had described was the proper one.

Mr. Elder said Professor Boys always inclined a piece of plain glass against the condenser, and between it and the light, by which means he had saved many condensers. If the heat got too great, the sheet of glass cracked and drew his attention to the light, and he attended to it before further damage was done. It had struck him more than once that the whole system of lantern projection might be altered and the light focussed on the slide. Commander Gladstone here gave a good hint, which may be useful to many lantern workers. After trying all kinds of dodges, he at last got a Sugg's chimney—16 in. long and 5 in. in diameter, such as used for their 500 c.p. light—and had it cut into four, and then put one portion right round the light, and that piece of chimney he had not cracked yet. Mr. Harrison had an idea that the practical value of the lantern would be increased if there were a power of altering the distance between the slide and the condenser. Mr. Kapteyn desired to know if lenses were deteriorated by the sun falling full upon them.

The Chairman's idea was that the most striking point about the system was that the rays were first collected into parallel and then condensed. There was a much smaller angle of rays used in the ordinary lantern than at first appeared, as the condenser and slide were both fixed, and the only moveable points were the light and the objective, and they must be regulated to secure good illumination, and they had often to carry the radiant further from the condenser, which, of course, reduced the angle. There was nothing in the lenses described by the reader to make their cost large, and possibly some optician would take the matter up.

Mr. Traill Taylor, in replying on the discussion, said if the condenser and slide were moveable, as he had always taught, the whole light could be focussed on a slide one inch in diameter. The degradation of tone by green glass was very great, and another degradation of tone arose from printing transparencies on green glass and covering them with the same material. Some slides became exceedingly offensive under these circumstances. Years ago he had had some transparencies printed on French crys-

tal glass, which showed no colour even when looked at edgewise. Mr. Newton, sen., once told him that he had never lost a condenser since he interposed a piece of slightly curved glass between the light and the condenser. The sun falling on the photographic lens set up a variety of reflections, and also degraded the glass, as was shown by the fact that people who used their lenses for solar enlarging complained that after a time the lens got slower. Mr. Little remarked that a Boston photographic firm imported no less than £8,000 worth of French crystal glass for transparencies alone in one year.

A cordial vote of thanks having been passed to the reader of the paper, the proceedings terminated.

## The Picture Galleries.

By "LOITERER."

### NEW GALLERY SUMMER EXHIBITION.

ENTERING the West Room of the New Gallery, one is reminded of the loss sustained by the death of Keeley Halswelle by the sight of his excellent "Kings of the Forest" (4). Unfortunately, the long season of fog seems to have played havoc with not a few canvases, e.g., Mr. H. S. Tuke's "Lamp-cleaners" (12). The picture by Mr. J. M. Strudwick—"Elaine" (17)—is excellent in colouring and drawing, and Mr. E. Stott's "Peaceful Evening" (18) realises its title. Venice suits the skill of Miss Hilda Montalba (20) as admirably as it does that of her sister, whose painting of "The Piazzetta, Venice" (257) is very fine indeed. Mr. T. M. Rooke is successful with his sketch of a church at Troyes (24). We think most people will admire "A Frosty Sunrise in the Marshes" (30) from the brush of Mr. G. H. Boughton, A.R.A. How fortunate Mr. William Wontner was in his model for "Lorna Doon" (30). The complexion is very well painted. Mr. F. Walton sends a good sketch, "Near Ewhurst" (48). A lurid and dramatic picture by Mr. E. M. Hall is entitled "Marriage by Capture" (49). A very professor-like portrait of Dr. Nichol (50) and an ungraceful portrait of Mr. J. M. Heathcote (136) represent Mr. W. Q. Orchardson, R.A. There is a sleepiness about Mr. Alfred Hartley's "In a Suffolk Lane" (51) which is exactly suited to the subject. Lord Randolph Churchill has so changed his appearance that Mr. Edwin Ward's portrait of his lordship (52), we fear, will be irreconisable in time to come. This picture will find a home in the interesting collection of portraits of modern statesmen which belongs to Mr. Henry W. Lucy. The portrait by Mr. John J. Sargent (56) is well worth looking at from the centre of the room, whence it will be seen to be extremely good. Mr. J. J. Shannon is rapidly progressing. His best portrait is that of Miss Clough, Principal of Newnham College and sister of the poet, Arthur Clough (61). Mr. J. E. Christie shows to advantage in "When the tide is low" (66). Our verdict on Mr. M. R. Jones' "Wood-cutters" (69) is that this picture is admirable. Despite a formality about "Cherries" (70), Mr. C. E. Hallé is to be complimented on this as well as on four other pictures in an exhibition which owes so much to his labours. The portrait of Mrs. Reckitt by Mr. W. Lewellyn (73) must not be overlooked, if, indeed, it were possible to ignore this striking picture. The thoughtful face of an historian peers from the canvas of Mr. H. Weigall (85). Buffalo Bill would appreciate Mr. Arthur Lemon's "Lost Comrade" (87). The "Passing Glory of an April Day" seems to be depicted in Mr. W. Padgett's "Hurried Clouds on the South Downs" (90). Marvellous marble characterises Mr. Alma-Tadema's "Love in Idleness" (96). The portrait of "Sir J. Preston, Bart." (98), by Mr. F. M. Skipworth, is decidedly good. There is clever painting in Mr. C. N. Hemy's "Trout" (99), and in Mr. Macallum's "Fishermen of Positano" (102). Two impressionistic pictures by Mr. J. R. Oldfield (104, 109) are noticeable. In the

### NORTH ROOM

Mr. Albert Goodwin exhibits a good picture entitled "October" (116). Mr. C. N. Kennedy appears to have hurried over his portrait of the Conservative "Whip," Mr. A. Akers-Douglas, M.P. (123). I wonder how many will admire Mr. H. Dalziel's "Wet Harvest" (125). Mr. Justin McCarthy, novelist, politician, historian—"and the greatest of these" is historian—is well depicted by Miss W. H. Thomson (129). Another good portrait is "Esmé" (138) by Miss S. Birch. We are too content with

Mr. Alfred Parsons and Mrs. Allingham to encourage Mr. Philip Burne-Jones to depict any more "Surrey Gardens" (143). The most astonishing picture in the whole exhibition is "Flood" (145), by Mr. J. T. Nettleship, which is terrible in its fearfulness. Mr. Ward's "Joyce" (149) is very pretty. Mr. J. W. Waterhouse, A.R.A., deserves high praise for his clever "Circe" (153). The portrait of a lady by Sir J. E. Millais (156) is not extraordinary. To some people, Mr. F. W. W. Topham's picture of the "Garden Front to Grocers' Hall" (164) will come as a revelation of a spot in the City "where dew falls." Professor Herkomer, R.A., sends a good portrait of "Lady Helen Ferguson" (167), but Mr. P. Bigland has not quite caught the expression in his picture of "Mr. Gladstone" (179). Doubtless, the artist was at a disadvantage, from the occupied air which the ex-premier assumes when writing. Mr. W. Maclaren has a charming picture in "By the Edge of the Stream" (181), and the hay in Mr. Adams' "Sunshine" (185) is well painted.

#### SOUTH ROOM AND BALCONY.

Mr. E. J. Poynter, R.A., is not seen at his best in "The New Barn, Sussex" (215). The portrait of Mr. Beatty-Kingston, the well-known special correspondent, by Mr. F. Goodall, R.A., is not striking. The curious effect in Mr. W. Padgett's picture (237) makes it interesting. Sir Arthur Clay's "Herr Joachim" (240) lacks the fire of inspiration which brightens the eyes of the great violinist when he is playing. There is much merit in Mr. J. B. Ottewell's "The Wood, Solemn and Silent Everywhere" (276), and "In a Mossy Bed" (280) reflects much credit on Mr. J. Fitzmarshall. Miss Nina Hardy has a pretty subject in "On the Best of Terms" (289), while few will pass without a smile Mr. E. Barclay's "Amesbury Church" (293). This represents a quaint village church, with clothes-lines in its neighbourhood, and to the picture Mr. Barclay wittily adds, "Cleanliness is next to Godliness." A rather dismal young lady is "Phyllis" (301) by Miss K. Stewart. She appears to be reading "Is Life Worth Living?" which, as Sydney Smith remarked, "depends upon the liver." Mr. J. Beck sends a very picturesque canvas in "Autumn Woods" (310). Professor Huxley's married daughter, Mrs. Roller, scores with her clever picture (311). All the pencil drawings by Mr. Rudolf Lehmann are admirable (325-333). The new acquisition to *Punch*, Mr. E. T. Reed, exhibits two drawings for our contemporary (343, 344), and both of them are remarkably good. The sculpture at the New Gallery is not very extraordinary, although the work of Mr. E. Roscoe Mullins, Miss E. Hallé, and Mr. Conrad Dressler is worthy of notice.

**Snap Shot Developer.**—The following, sent us by Mr. F. Young, will be found useful:—

Solution A: Weigh 6 drams sulphite of soda, dissolve in  $1\frac{1}{2}$  ounces water, then add 25 grams citric acid, finally add 2 drams of pyro, and make up to  $2\frac{1}{2}$  ounces with water.

Solution B: A sat. sol. common washing soda.

To use the developer, take 1 part of A to 7 of B.

This developer is only for snap shots. Time exposures would be hopelessly fogged, but since using it as above I have never failed to get a good, sparkling negative full of detail.

**Dry-Plate Photography.**—We have received from Messrs. J. Lancaster and Sons, Birmingham, a copy of their 1891 Catalogue of Photographic Apparatus. It is a most excellently arranged book, and every amateur photographer should possess a copy. The excellence of the goods manufactured by Messrs. Lancaster needs no praise from us, as it is a fact that from the cheapest to the most expensive article manufactured by them, they are of uniform excellent quality and manufacture. We are sorry to note that Messrs. Lancaster have found it necessary to append the following cautions to buyers "against spurious imitations." They are determined to send out only goods of the best possible quality, and would ask purchasers to see that every article is stamped with their trade mark, as in many cases they have found their cameras have been sold with most inferior slides, and that lenses have been put into cameras of a very common type and sold as their sets. A method of deception that prevails largely is to put a common French rectilinear, or a single lens on a camera advertised as Lancaster's camera, etc., at a large discount off makers' prices. Messrs. Lancaster state that they do not supply any but legitimate members of the trade, and warn buyers against being taken in by these deluding advertisers. This caution cannot be too widely made known, and the amateur photographer will do well either to buy of Messrs. Lancaster, or exercise considerable discretion as to the purchase of their goods from firms advertising them at prices below those given in the firm's catalogues,

## Quarterly Examinations in Photography.

**Question 11**—An operator is using a 15 in. focus lens with a diaphragm of  $\frac{3}{4}$  in. aperture, and wishes to use a 9 in. focus lens with a diaphragm of the same aperture,  $\frac{3}{4}$  in. What will be the relative exposures required for the same subject with the second lens under precisely similar lighting, and how is this determined?

**ANSWER.**—A diaphragm of  $\frac{3}{4}$  in. aperture with a lens of 15 in. focus would be  $f/20$ .

$$\frac{15}{1} \div \frac{3}{4} = \frac{15}{1} \times \frac{4}{3} = \frac{20}{1} = 20.$$

A diaphragm of  $\frac{3}{4}$  in. aperture with a lens of 9 in. focus would be  $f/12$ .

$$\frac{9}{1} \div \frac{3}{4} = \frac{9}{1} \times \frac{4}{3} = \frac{12}{1} = 12.$$

By squaring these numbers  $f/20$  and  $f/12$ , and comparing gives the relative exposures—

$$20 \times 20 = 400. \quad 12 \times 12 = 144.$$

$$\frac{144}{400} = \frac{12}{33} = \frac{4}{11} \text{ nearly.}$$

If with the 15 in. lens the exposure required was 11 sec., the 9 in. lens would only require 4 sec., or if the former required 1 sec. the latter would require  $\frac{4}{11}$  sec.

Yxol.

**Question 12.**—What is the action of a solution, (a) of sugar, (b) of glycerine, (c) of potassium bromide, (d) of potassium citrate, in the developer? Explain your answers.

**ANSWER.**—All four act as restrainers. The first two are physical restrainers, and probably cause the developer to act more slowly by making it thicker and more viscid. Some people fancy that the use of such physical restrainers affects the colour of the resulting negative less, and blocks up the shadows less than the chemical restrainers. Experiments I made pointed to glycerine being a more powerful restrainer than sugar.

The potassium bromide probably forms a double salt with the silver bromide, which is less easily reduced than the silver bromide, and while it allows a certain amount of detail to appear, to some extent checks the action in the high lights.

Potassium citrate appears to check detail, but to allow the high lights to gain density.

Unless some restrainer is employed, fog would ensue, as the unaltered silver haloids would be reduced.

R. C. M.

**The "Gentlewoman."**—The rivalry of illustrated journalism results in such wonderful productions as the spring number of this journal. This splendid sixpennyworth of social subjects has additional attractions in the number before us. Firstly we have a clever and complete parable from the facile pen of Mrs. Lynn Linton. Secondly, we have an interesting account of Mr. Beatty-Kingston, the special correspondent, by Mrs. George Augustus Sala. Thirdly, we have capital coloured fashion-plates, which will delight the ladies almost as much as a sight of the shops in which the costumes are exhibited. Lastly, we have the numerous features which have made the *Gentlewoman* the favourite which it is. Its older contemporaries, the *Queen*, the *Lady*, and the *Ladies' Pictorial* produce wonderful numbers, but "this excelleth them all." With the modern Pandora this magazine should become a constant occupant of her treasure-house.

**The Annual Index of the Review of Reviews.**—This book includes an "index of the periodicals of the past year and a list of standard photographs." In the index we find very liberal reference to the *Photographic Quarterly*, some twenty of the admirable articles having been quoted in the year's volume. Mr. H. Snowden Ward undertook a very heavy amount of work in the compilation of the "Index of Standard Photographs," and in our opinion a very useless one. The leading firms of photographers are well known, and their lists are always approachable. We understand several of them refused to give access to their lists, and as a consequence the index is very incorrect. The illustrations are not representative of the best men's work. It is apparent that the compiler has been anxious to do his best, but the matter before us proves conclusively that the trade have no desire for such an index, and we question whether it is of the least service to the public. The section devoted to "Periodicals" is much better compiled, and includes a notice of the *Photographic Quarterly* and *Photographic Reporter*; but in the notice of the *AMATEUR PHOTOGRAPHER* the information is incorrect, inasmuch as the price is quoted as 2s. 6d., and the description given "Illustrations, Prize Pictures." This is unmistakably a reference to the "AMATEUR PHOTOGRAPHER Prize Pictures series." The work of the section is, however, well arranged, and is a most useful help to all interested in or connected with journalism.

## "Amateur Photographer" Dark-Rooms, 1891.

THE "DARK-ROOMS" kindly placed at our service for the use of amateur photographers are classed as follows:—

*a* Amateur *d* Dealer or professional.  
*h* Hotel *s* Photographic society.

Letters of Introduction, Three Penny Stamps.

NOTE.—At the time of going to press we have not received signed authority for the use of "Dark-rooms" marked\*; but they were all placed at our disposal last year, and are doubtless available.—Ed. AM; PHOT;

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and *plainly* endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

#### LABELS FOR BOXES OF UNEXPOSED PLATES.

The following list in different languages may prove of service to the tourist; it has been kindly supplied to us by Mr. W. E. Woodbury:—

*English*.—Sensitive photographic plates, which will be quite spoilt if opened in the light. Only to be opened in a totally dark room or by a red light.

*French*.—Plaques photographiques sensibles. Tout détruites par l'exposition à la lumière. Prendre garde de n'ouvrir la boîte que dans une chambre parfaitement obscure.

*German*.—Photographische Trockenplatten Sehr lichtempfindlich. Werden ganz verdorben, wenn dem Lichte ausgesetzt. Müssen nur in absolut dunkeln Zimmer oder bei rothem Lichte geöffnet werden.

*Spanish*.—Las placas fotograficas sensitivas, que se inutilizan si se las expone al abrirlas, a la luz del dia, se pueden abrir sin inconvenientes en una habitacion enteramente oscura o iluminada por luz roja.

*Portuguese*.—Laminas photographicas sensitivas. Nao podem ser expostas á luz porque se inutilizam; podendo só ser abertas em camera, escura oce com luz vermelho.

*Dutch*.—Chemisch toebereide photographische platen weke gehue bedorven worden als zy aan de lucus worden blaetgeschild. Alleen te openen in eene donkere kamer of by rood licht.

*Italian*.—Piastra fotografiche sensitive che si simperanno affatto se esposte alla luce del giorno. Da aprirsi solo in una stanza affatto buia o dove regni una luce rossa.

*Norwegian*.—Følsomme fotografiske Plader, som fuldstændig forderves ved at udsættes for Lyset. Bør kun aabnes i et aldeles mørkt Rum eller ved rødt Lys.

*Swedish*.—Sjuskäusliga fotografiska plåtar, blifva förstörda om de utsättas för ljus. Fås därför ej öppnas utom i ett absolut mörkt rum.

*Greek*.—Ὅτι εὐαρόδοξοι φωτογραφικὰ πλάτεις αἰξίνῃ δα φθαρῶσιν ἂν ἀνοίχῃσιν ἐν τῇ φωτὶ. Δέον νὰ ἀνοίχῃσιν ἐν συντενῶν ὁματῶν, ἢ μέφας ἐρυθροῦν.

**Exchange Club**.—The notice in a previous number having brought in more replies than were required, a second club has been formed on same lines, and the Hon. Secretary (Mr. R. W. Copeman, Kuklos Cottage, Henstridge, Blandford) will be glad to hear from four ladies or gentlemen wishing to join to complete the number. As the object of the Club is to exchange as well as criticise members' work, there is little doubt of its ultimate success. Full particulars and rules may be had of the Hon. Secretary.

**The "Practical Photographer's" Federation**.—We understand that it is proposed to form a federation of photographers to work in the Canadian Dominion, where the organiser, Mr. W. Ethelbert Henry, C.E., believes there are exceptionally favourable openings for photographic enterprise. We are not able to judge of the matter, but should have thought that there were already no lack of photographers in Canada, and that our 'cute American cousin would cover the ground without a federation from England. The following paragraph, which we take from the prospectus, may possibly induce some of our readers to make further enquiries of Messrs. Percy Lund and Co., the County Press, Bradford, who are the "General Secretaries" of the scheme: "Mr. W. Ethelbert Henry has made careful calculation of the expense of instituting the federation, and can undertake for the sum of £2,000, to pay the promoters' remuneration, and all expenses of starting the federation as a going concern, viz., saloon steamboat accommodation from port to port, and railway fares, hotel expenses, etc., until work is commenced; outfit for centre, and outfits, including apparatus and materials, for branches, and tents, etc., where necessary. The stock of all materials will be sufficient for several weeks' working, and it is expected that even after bearing all these expenses the capital will be sufficient to allow of £400 (or £10 per member) being laid by as a reserve fund. An individual photographer emigrating, or a party of two or three, would probably spend at least £50 each in mere cost of reaching the ground."

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

THE success of Mr. W. Crooke, of Prince's Street, Edinburgh, at the Crystal Palace Exhibition has filled the photographic world of Edinburgh with delight, all the more so that it is looked upon as making up for the treatment he received in the Edinburgh Photographic Exhibition. The photographs exhibited by Mr. Crooke in both exhibitions were the same. Rumour had it that in Edinburgh he had been awarded the gold medal for the picture which professed the highest degree of merit, but when the lists were published it was announced that "the jurors had not been able to select any one picture of such prominent merit as to justify them recommending it for the society's gold medal." The collection obtained a silver medal in Edinburgh for the set of six portraits above 12 by 10 ins., an award which pales into insignificance before the specially awarded gold medal of the Crystal Palace. Mr. Crooke is known to be one of the most artistic of photographers, and most unassuming in his business ways. For instance, although he has introduced flash-light portraiture as a branch of his business, he has left it to advertise itself, instead of courting newspaper gush. As a matter of fact, the picture of the two ladies, which was favourably noticed in the AMATEUR PHOTOGRAPHER a fortnight ago, was photographed as an ordinary business engagement, and was not, as is often the case, a picture got up specially for exhibition purposes. In connection with this it may be mentioned that it was Mr. Crooke who first introduced flash-light photography to the Edinburgh Photographic Society, which he did in a communication several years ago.

The death is announced of Mr. Magnus Jackson, a well-known photographer in Perth, at the age of 60 years. Mr. Jackson's landscape photographs are well known in the central districts of Scotland. He gained a silver medal at the Forestry Exhibition in Edinburgh in 1884, for photographs of trees, and a bronze medal and diploma of merit at the Edinburgh Exhibition of 1886 for views of ferns and foxgloves. Mr. Jackson started his photographic career as an amateur, but before commencing business on his own account he took a course of study in photography in London.

According to custom, the spring meet of the Edinburgh Cycling Clubs was held on Saturday, and according also to custom, the party, who on this occasion numbered 440, were photographed beside the picturesque ruin of Roslin Castle. The operator was Mr. J. M'Kean, of Leith, and Newington Road, Edinburgh. It goes without saying that in this district there are many cyclists who are also ardent amateur photographers, and I wonder that a club of photo-cyclists has not ere this been formed. Any such club would be certain to be a great success.

At the Edinburgh Photographic Society meeting this week, Mr. W. T. Bashford, Portobello, reads a paper on "Allotropic Silver;" and Mr. W. Forgan, Edinburgh, another on "Aluminium as a Mountant for Lenses." The first of the three outdoor meetings, or, as the Secretary calls them, "Saturday Rambles of the Society," takes place on Saturday, 16th May. The members will go to Inverkeithing, across the Forth Bridge, by the 2.10 p.m. train, and return by train from Inverkeithing at 6.25. The chief objects of interest in Inverkeithing, it is announced, are the church, the Town House, Fordel House, Gala House, and the Market Cross, while land and sea scapes may be had upon the bay, at Rosyth Castle, and on the wooded shore towards Aberdour. If the weather be favourable there is sufficient material available for the spending of a profitable afternoon. The other rambles are fixed for 6th June and 4th July, but the localities to be visited have not yet been determined.

The Council of the Edinburgh Photographic Society have drawn up regulations for competitors in the competitions for the three silver medals which are offered for work done this year. These require that all pictures must be the work of the exhibitor—exposing, developing, retouching, printing, and toning; apparently, mounting and burnishing may be done by anyone else. The prints must be direct prints. Pictures competing for the President's medal must be taken at one of the subsequent Saturday rambles of the Society. The awards are to be decided by vote of the members of the Society; the prints which secure the medals are to become the property of the Society; no competitor will be allowed to take more than one medal, but should more than one be awarded to him, he will be allowed to select which he will take; and the competing pictures will be

exhibited from the 29th of October to the 4th of November. These dates are, however, tentatively fixed. It is to be hoped that members will support the Council in this effort to improve the position of the Society.

The Leith Amateur Photographic Association met on the evening of Tuesday 28th ult., Mr. W. M. Smith in the chair. Mr. Pitkethly, the Secretary, read the third of a series of papers on elementary subjects; the topics dealt with being "Composition and Exposure." He was, he said, in favour of the use of exposure tables as a guide, but he could not advocate complete reliance on them. The prevalent use of small stops for all descriptions of work was, in his opinion, inadvisable, F. 22 being sufficient for all ordinary exposures. Photographers, he thought, should make correct exposure a study, instead of endeavouring to correct errors in exposure by development. Specimen prints on Dr. Jacoby's chloride paper were shown.

## Notes from Paris.

It has already been pointed out in these columns that it is not advisable for anybody—especially a foreigner—to be found with a photographic camera in the vicinity of any fortification, more particularly if the fortification should be near a frontier. To be seen using a camera, sketch-book, or even a map, within a mile of a fort is, in the eyes of a French *gendarme*, flat burglary, and the individual found with either in his possession is at once arrested as a spy. Just a year ago I "interviewed" an American citizen (of German birth), who had been seen consulting a map, and was, in consequence, in jail six days before the American consul could procure his release. The latest victim of the "spy craze" is Mr. E. Hewitt, son of a former Mayor of New York, who was arrested last week at Mauléon, near the Spanish frontier, whilst photographing. Mr. Hewitt was provided with a passport, and had no difficulty in proving his nationality, nevertheless he had to pass forty-eight hours in durance vile, and also (which is perhaps worse) undergo a searching cross-examination by a French *juge d'instruction*.

The *New York Herald*, which possesses a very esoteric idea of humour, had a leader on the incident, and made some remarks that were intended to be funny, but only succeeded in being stupid. The article was all the more cruel as the only "smart" man the *Herald* ever possessed used to carry a detective camera inside his coat and take snap-shots at every person he interviewed or place he described.

A new magazine has just made its appearance in Paris. It is entitled *Paris-Photographe*, and is brought out by Nadar. The first number contains an excellent portrait of Daguerre, a lot of "instantos" of men fencing, horses jumping, etc., and several well-written technical articles. Perhaps the best part, however, is the cover, which bears a beautiful figure of the Genius of Photography, drawn by Emile Bayard, the well-known artist.

## Notes from the Liverpool Centre.

(By our District Editor.)

At the ordinary monthly meeting of the Liverpool Society last Thursday there was a large attendance. Seven new members were elected.

Mr. J. A. Furnival, of Manchester, gave a lecture, "The Optical Lantern, and What can be Done with it," introducing a series of instructive and interesting experiments, including various microscopic curiosities.

Next Saturday the first excursion this year of the Liverpool Society takes place at Chirk; leader, Mr. Paul Lange.

Included in the prospective programme of the premier local society, is a paper and demonstration on "The Carbon Process," by Dr. Manton, of London and Sheffield (May 28th), and a paper with experiments on "Chemistry and Photography," by Mr. W. A. Brown, of Liverpool (June 25th).

Miss Lil W. Tomkinson's success in taking the silver medal in the Ladies' Class at the Crystal Palace Exhibition has given great satisfaction here. She is the daughter of Mr. W. Tomkinson, Vice-President of the Liverpool Society.

**Brixton and Clapham.**—By an oversight, the name of Mr. F. W. Edwards (President) was omitted from the list of judges at the annual exhibition of work held in the Gresham Hall, Brixton, on the 17th and 18th ult.

## Societies' Meetings.

**Bath.**—An ordinary meeting was held on Wednesday, 29th ult. Mr. Pumphrey presided. The principal feature on the programme was provided by Mr. E. Lambert, who gave a brief discourse on the use of single meniscus lenses for portraiture, illustrating his remarks with examples of work produced as indicated. Among the subjects chosen were some well known local celebrities. An interesting discussion followed, in which the Chairman, Messrs. Braham, Harbutt, and Middleton Ashman took part. It was also decided to discontinue the indoor meetings during the summer, and start the excursions on Wednesday, May 27th. A dark-room candle lamp, "The Champion," was sent for exhibition by Mr. Yabsley. Some defective bromides and ordinary prints of large size were shown by two members, to illustrate faulty material occasionally met with.

**Barrow-in-Furness.**—A meeting was held on the 30th ult., Mr. R. Spencer in the chair. A paper was read by Mr. W. Dunlop on "Enlargements," in which he described the method of producing enlargements by natural light, and gave many practical hints relating thereto. An interesting discussion took place afterwards, in which all the members joined. A letter was read from Mr. J. P. Smith (Treasurer of the Club), offering to give a prize of one guinea for the four best photographs taken by members on the Club excursion to Grange and Cartmel on June 6th. The offer was cordially accepted.

**Belfast.**—The second annual exhibition was opened on the 28th ult., when there was a good show of members' work. The following is the prize list:—Class 1, junior members (who started photography during 1890: James A. Pollock. Class 2 (a), quarter-plate landscape (members): 1, James H. Hamilton; 2, John E. Pim. Class 2 (b), half-plate landscape (members): 1, David S. Keay; 2, John E. Pim. Class 2 (c), any size landscape (members): prize withheld; only one set entered. Class 3, club excursions (members): 1, James H. Hamilton; second not awarded. Class 4, instantaneous (members): 1, James M. Cleery; 2, T. B. Scott. Class 5, enlargements (must be entire work of member): 1, William Strain; 2, James M. Cleery. Class 5 (a), enlargements (may be made by professional member): 1, William Strain; 2, James M. Cleery. Class 6, lantern slides (may be made by professional member): 1, T. F. Bell; 2, James H. Hamilton. Class 7, juniors (confined to residents in Ireland): prize withheld. Class 8, landscape (confined to residents in Ireland): 1, John White; 2, J. D. Lysaght. Class 9, architecture (confined to residents in Ireland): T. F. Bell; 2, John White. Class 10, lantern slides (confined to residents in Ireland): 1, John White; 2, Wm. Swanston. Class 11, animals (confined to residents in Ireland): 1, T. F. Bell. Class 12, landscape (open): 1, John E. Ausin; 2, A. R. Dresser. Class 13, landscape, with figure (open): 1, John E. Austin; second not awarded. Class 14, instantaneous (open): 1, A. R. Dresser; 2, John White. Class 15, enlargements (open): 1, William Strain; 2, J. D. Lysaght. Class 16, lantern slides (open): 1, J. E. Austin; 2, Clarence James. Messrs. William Swanston, Ulster Amateur Photographic Society; W. J. Kilpatrick, Donegal Place; and Robert Welch, Lonsdale Street, acted as judges, and their decisions were marked with great fairness, and gave entire satisfaction. In the evening the lantern slides sent in for competition were shown.

**Birkenhead.**—The annual meeting of the Y.M.C.A. Camera Club was held on the 1st inst. The officers elected were: President, Dr. Stansfield; Secretary and Treasurer, Mr. H. E. Gim; and the Committee, Messrs. T. A. Baty, J. C. Walker, and J. W. M. Richardson.

**Brighton.**—At the meeting on the 28th ult., the President in the chair, Mr. Douglas E. Caugh gave a demonstration of "Photo-Micrography," exposing two plates, and successfully developing same. The results were passed round and considered highly satisfactory. Prints from the negatives taken on the Arundel and Steyning excursions were passed round. Next excursion, Whit-Monday, to Bosham, when the Southsea Society will join.

**Burnley.**—On the 29th ult. Mr. J. Naylor, of Harlesden, gave to the members and friends a most interesting lantern exhibition of various pictures taken by him in England and Wales. These views were very much admired, not only on account of their artistic selection, but also because Mr. Naylor was able to render them so admirably as photographs. He is thoroughly master of the art in which he so greatly excels, and has taken prizes at various exhibitions.

**Croydon Micro.**—At the ordinary meeting on the 1st inst., Mr. J. A. Carter, M.A., in the chair, Mr. D. E. Goddard, F.R.M.S., read a paper on "Elementary Silver Printing." Mr. Goddard, in an interesting way, set forth the whole routine of silver work, from sensitising one's own paper to the finished and mounted picture. A series of pictures showing results to be obtained by printing under different coloured glasses were exhibited. At the conclusion a very lengthy discussion ensued, in which Messrs. J. Weir-Brown, Marriott, and the Chairman took part. Mr. Weir-Brown called the attention of those present to the necessity of having a fixed subject for the Friday meeting nights, whereby instead of simply meeting for ordinary conversation it would be more beneficial to have a short paper and so form a

ground-work for a discussion which would follow. Saturday, May 9th, whole-day excursion to Arundel; conductor, Mr. J. Purser.

**Dublin Y.M.C.A.**—Two practical demonstrations have been given to the members by the Secretary, and two lantern evenings agreeably spent during the past month. A number of excellent slides belonging to two Dublin gentlemen, Mr. Keogh and Mr. Goodwillie, occupied the attention of the Club for an evening, and on the second evening a set belonging to Mr. McCabe, a series of instantaneous studies were shown. Both sets were choice, and were intensely admired by all as guides for their own work.

**Holborn.**—The usual weekly meeting of the Holborn Camera Club was held on the 1st inst., Mr. T. O. Dear (Vice-President) in the chair. Mr. James Sharpe and Miss C. H. Morgan were elected members of the Club. Mr. E. H. Bayston then read an excellent article by Arthur S. Newman, on "Photographic Shutters." In it the writer, in dealing with the various forms of shutters, described the direction of the movement of the shutter, the position in which the shutter was used, and the manner in which the resulting image was affected by alterations in the direction of the movement, or of the position in which it was operated; and in conclusion he thought the following would be found a fair and reasonable answer to the oft-repeated question, "Which is the best shutter?" For speed—one working in or near the diaphragm slot, and having a direct and continuous motion, either rectilinear or rotary; or, if absolute correctness and image is not important, one working just in front of the plate and having a narrow aperture across the blind. For fine definition—one working at or near the diaphragm slot, and opening from and closing to the centre. For studio work or photographing animals—one contained in the camera and easily operated from the outside. For increasing foreground exposure and adaptability to several lenses—one opening up and closing down and fitted on the hood or front of the lens. For evenness of illumination—one having a "direct" motion. Mr. Bayston illustrated the article by showing several forms of shutters now on the market.

**Lantern Society.**—On the 27th ult., Mr. E. W. Bulkeley gave a lecture on "The West Indies," illustrated by Mr. F. York's fine set of lantern slides. This was the last meeting of the present session, and the meetings of the Society will be resumed in October next.

**Liverpool.**—The third ordinary meeting of the twenty-eighth session was held on the 30th ult. Mr. Paul Lange (President) occupied the chair, and there was a large attendance of members. The following were elected members of the association, viz., Messrs. W. R. Melly, W. N. Samuelson, J. Pickering Jones, Thomas Wynne, M. Sanders, C. F. Burne, and W. E. Elsworth. The President exhibited Mr. Friese Greene's hand-camera, enabling as many as sixty consecutive photographs to be taken in one minute. Mr. John Price exhibited and explained Voigtlander's 5 by 4 in. hand-camera lens, also Ross and Co.'s Universal Symmetrical lens, new rapid series; Mr. J. T. Norman Thomas showed a framed picture of a view on a lake, which represented four swans in the foreground, whereas when the photograph was taken there were only two on the water. A number of reasons for the phenomenon were given (some of them amusing), the most likely being that a double exposure had been given, and the swans in the meantime had sailed nearer to the camera. Mr. Thomas S. Mayne (Exhibition Secretary) then made a statement regarding the probable financial results of that undertaking. The accounts, it was expected, would be ready for the meeting on 28th inst. Although the success had far exceeded all expectations, the expenses had been very heavy, but it was anticipated the net profit would be about equal to that of the former exhibition of 1888, which resulted in £250 being handed to the society's treasurer. Mr. John Woolfall explained the progress that was being made to get the long delayed return Boston set of slides completed, viz., "Illustrated Liverpool." The President drew attention to the excursions for the present season, the first of which had been arranged for Saturday, 9th inst (whole day), to Chirk and district. Permission had been obtained from Col. Myddleton Biddulph to photograph the castle, and an excursion would be made to Quinta, another beautiful mansion, a Chatsworth in miniature. Mr. J. A. Furnivel, of Manchester, then proceeded to give a most interesting description of the optical lantern, explaining its various parts, viz., the jets, gas cylinders, etc., and after the lantern had been lighted up, gave some curious sound experiments, which represented waves of sound of the human voice, on the screen; beautiful microscopic slides were also shown, and the adaptability of the lantern to microscopic work explained. As Mr. Furnivel exhibits for Dr. Dallenger, Sir Robert Ball, and Professor Muybridge, his lecture was a most valuable one to those interested or engaged in the working of the optical lantern.

**Loughboro'.**—The annual meeting of this section was held in Mr. W. Clarke's rooms on the 29th ult. The accounts for the year were presented, showing a balance in hand of £5 3s. 11d. The officers were re-elected, and arrangements for the first excursion to Lincoln Cathedral on Whit Monday were made. The list of places to visit for the ensuing season was drawn up. Number of members now on the books, 27.

**North Kent.**—The usual monthly meeting of this Society took place on the 23rd ult. The President being absent through illness, Mr. Hodsoll, A.C.A., took the chair. The chief event of the evening was a lantern exhibition, and the "In and About Columbus, Ohio," set of slides was passed through the lantern by the Hon. Secretary assisted by Mr. Barlow.

**Phot. Soc. of Great Britain.**—At the monthly technical meeting on the 28th ult., Mr. T. Bolas, F.C.S., being in the chair, the chairman said that there was a very excellent collection of slides of animals, and requested the gentlemen present to explain these slides as they were shown in the lantern. A number of slides were from negatives taken at the Zoological Gardens in 1864 by Mr. F. Haes, including one of the quagga, which is said to be nearly extinct, but Mr. Haes had received a letter from Mr. Selous, a well-known hunter who is out in Mashonaland, saying he had seen any number of them. In taking the negatives a double flap shutter was used, giving an exposure of rather less than a fifth of a second. The chairman said that the interest of this series consisted in the fact that they were made by the wet collodion process and they must be looked upon as a very great triumph and as possessing considerable historical interest. A series of slides by Mr. H. Sandland were next shown, including views illustrating Sanger's show passing through Maidstone. Mr. W. Wainwright's slides were next shown; these were taken with a 7½ by 5½ camera and reduced. Mr. J. J. Bright's slides followed; these were all more or less domestic in character and were taken with a Beck camera and 7 inch focus lens. A slide of swans taken by Mr. T. E. Freshwater with a wide-angle lens of 6 inch focus was next shown. Mr. Lewis Medland exhibited a number of slides of animals, followed by a set made from earlier drawings of similar subjects and from old engravings to illustrate the idea given of that form of wild creatures before the photographic era. Mr. W. E. Debenham considered that animal photography had had a great effect upon animal painters. Mr. F. Haes thought that a great number of the positions in Muybridge's book on "Animal Photography" were not suitable for artistic purposes; he also pointed out the advantages of stereoscopic pictures. Mr. Sandland said there were some old pictures that an artist taking advantage of modern knowledge would find it difficult to surpass. Some slides by Mr. Tington Chang were then shown.

**Richmond.**—Meetings were held on the 24th ult. and 1st inst. At the former, Mr. Ramsay in the chair, there was a lantern show. The meeting on the 1st was important and interesting, the subject being "Hand Cameras," and many makers having responded to the Secretary's invitation to send an exhibit, members had the opportunity of inspecting many of the best known types, and in several instances having them explained by representatives of the manufacturing firms. Major Nott showed a camera of his own design of extreme lightness and simplicity which had done good work all the world over, and Mr. Cembrano wound up a most instructive evening by showing a camera designed for use with several different lenses and just specially made for him by Mr. Newman.

**Royal Society.**—At the meeting on the 30th ult., a paper, entitled "Cloud Photography conducted under the Meteorological Council at the Kew Observatory," by Lieut.-General R. Strachey, R.E., F.R.S., and G. M. Whipple, B.Sc., F.R.A.S., Superintendent of the Observatory, was read. The authors described the work which had been in progress under their charge since 1878, illustrating it copiously with lantern slides and photographs, many of which were admitted by those who saw them to be unique and of great beauty, while the methods they employed for determining the heights of the clouds above the earth's surface and the system adopted for finding the rate of motion of the currents of air in which they floated, were commented upon by the President, Sir William Thompson, Lord Rayleigh, the Secretary, and other speakers, as extremely ingenious and being capable of rendering far more accurate results than any others hitherto employed, either at home or abroad. The range of observations in the list of results given by the authors, extended from clouds floating less than one and a half miles high in air moving at seven miles per hour to nine miles above the ground in gales blowing sixty-five miles an hour, whilst the surface wind was only a gentle breeze of five miles per hour. The advantages of a knowledge of such aerial investigations in the preparation of weather forecasts was ably pointed out by Mr. Symons, the Secretary of the Royal Meteorological Society.

**Stockton.**—The last lantern evening was held on the 27th ult., when Dr. Stainthorpe (the President) exhibited a series of charming slides illustrating a three weeks' tour in Scotland. Mrs. Stainthorpe wrote a descriptive lecture of each slide, and very kindly consented to read the same, winning the hearty appreciation of the audience. With such a President, backed up by such an excellent assistant, the Society ought to make headway.

**West London.**—On the 2nd inst., owing to the rain, only four members turned up at the first outdoor meeting at Wimbledon Park.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4660. **Norway.**—I am proposing a tour (fourteen days) to Norway, starting June 9, and shall be glad to hear of a companion (amateur photographer).—G. J. Jones, *Gazette Office, Malton*.

4661. **Gold.**—Is the gold of which the current coin is made sufficiently pure for making into chloride of gold, and if so, how can this be done? If not pure enough, how can the gold be separated from the alloy?—J. W. W.

4662. **Developer for Hand-Camera Work.**—What developer do you recommend me to use for hand-camera work only? I should like one that will give some time, as I only use it occasionally. Please give full particulars for mixing.—W. H. T.

4663. **Enlarging.**—Kindly say what is the best machine at a reasonable price to make good enlargements from quarter-plates, and also to act as a good magic lantern. What price should it be got for.—W.

4664. **Focal Length.**—What is the focal length of a Lancaster's half-plate 1889 Instantograph?—W.

4665. **Pompeian Blue.**—Some time ago was published, I believe in the *AMATEUR PHOTOGRAPHER*, a recipe for making the old Pompeian blue colour. Can any reader refer me to the number in which it appeared?—QUIS.

4666. **Plates, Preserving in Tropical Climates.**—Could some one tell me how dry plates can be preserved for say two to three years in tropical countries without losing any of their properties? Can some one recommend a suitable developer for tropical countries, hydroquinone preferred, simple but efficient, and how must its ingredients be kept? What is the best mode of preserving bromide or Aristotype papers in a hot climate?—R. L.

4667. **Testing Shutters.**—Will some one kindly inform me how to test the speed of a shutter by photographing a spinning bicycle wheel?—PHONE.

4668. **Tour in S. Wales (near Brecon).**—As I am thinking of making a tour round about Brecon, would any brother amateur tell me about the time of exposure, time of day, etc., for mountainous scenery, river ditto, and deep gorges? Also if there is any place I could develop plates, etc.? Any information I shall be deeply grateful for.—PROVINCIAL.

4669. **Obernether Paper.**—Will some kind reader tell me how to prevent Obernether's chloride of silver paper sticking to glass when squeezed on to it in order to give print a glazed surface? I have tried tale without much success.—W.

4670. **Groups.**—Can groups be taken in a studio and out of doors with a single view lens, and if so, and using a full plate lens, what would be a proper distance between lens and sitters for carte, cabinet, and full plate pictures? Also time of exposure with gelatine plates?—ECONOMY.

4671. **North Wales.**—I purpose spending a few days in this district about Whitsuntide, and wish to make Bettws-y-coed my centre. Will any brother amateur kindly favour me with the following information, viz., views, time of day, probable exposure with Iford ordinary and a R.K. lens, and also a single landscape lens, quarter or half plate best? I don't mind walking six or eight miles. Any hints as to lodgings, expenses, and where to stay will be esteemed by.—ECON.

4672. **Names on Negatives.**—Will any one tell me how and with what I can write on a negative so

as to print white such as a name, etc.?—A. H. LLOYD-ROBERTS.

4673. **Pyro Developer.**—Would any of your readers kindly give me the formula for a good reliable pyro developer? I should be delighted to get a really good one. I have an awful trouble with the one I use; the minute I pour it over the negative it suddenly goes black all over. Is this through over-exposure or too much ammonia? The developer I use is as follows:

No. 1.	
Pyro ... ..	20 gr.
Water ... ..	10 oz.
Citric acid ... ..	2 gr.

No. 2.	
Bromide of ammonia ... ..	6 drms.
Ammon. fort. '89 ... ..	1 oz.
Water ... ..	80 "

To develop I use equal parts Nos. 1 and 2.—H. S. B.

4674. **Melrose and Peables.**—Wanted an address in each town where I can change plates about 21st inst. Thanks in anticipation.—E. O.

4675. **Photogravure.**—Will any reader who has tried kindly tell me which method gives the best photogravure from a line engraving? Does the bitumen process give sharper results than are obtained with gelatine (etched in the usual way), or is there any advantage in making an electrolyte plate from a gelatine positive?—JUVENILE.

4676. **Negative for Process Work.**—Can a negative be made from a line engraving, the lines of which vary in depth (from black to pale grey), so as to show quite clear glass for all the lines? I want to produce a negative that will give a print in which all the lines will be equally black.—JUVENILE.

4677. **Lens for Hand-Camera.**—I should be glad if some one could tell me if Lancaster's quarter-plate lens would fit any quarter-plate hand-camera or smaller size.—ALF.

4678. **Brass Work.**—I wish to photograph some art brass work, such as clocks, vases, etc. Should they be taken when they are finished, that is, bright and lacquered, or should they be painted over with some colour, and what colour? What kind of background would be the best, dark or light?—B. A. SMITH.

## QUERIES UNANSWERED.

April 24.—Nos. 4638.

May 1.—Nos. 4647, 4648, 4653, 4654, 4655, 4657, 4658, 4659.

## ANSWERS.

4642. **Carbon Process.**—Monckhoven's "Manual of Carbon Printing," and the Autotype Co.'s "A.B.O. Guide to the Carbon Process," are the only two works. The latter is the simpler and plainer, the former more complete and more useful.—OSIRIS.

4643. **Hand-Camera.**—See answer to 4635 in last week's issue.—PARTHENON.

4644. **Hand-Camera.**—Either the Rover, Lancaster, or Talbot and Eamer's perfected Talmer would suit you. The latter is a capital instrument.—PARTHENON.

4645. **The Moselle.**—If your inquirer knows German he will be able to get pleasant accommodation at roadside inns on the Moselle for about 5s. a day; if he must go where they speak English, it will cost him 8s. The pleasantest way is to make the trip on foot from Treves or down the river by boat, landing occasionally to cut off the river windings. It is said that the Bishop of Treves intends to exhibit shortly the spurious relic called the holy coat of Jesus. The Great Eastern route v'a Antwerp and Luxembourg and back by Rotterdam is the pleasantest.—THE YANKEE SUNFLOWER.

4646. **Names on Negatives.**—To put the name, etc., on a negative, I simply use a small piece of stamp paper about one inch long and one-eighth of an inch wide; wet it, and place it on the edge of the film side so close to the edge that it won't interfere with the printing.—H. S. B.

4646. **Names on Negatives.**—Write backwards on the varnish with ink or black varnish, using a steel pen. It is best to draw two fine lines with a pin point, in order to keep the letters of the same size. Mr. A. Gray, 44, Snow Hill, E.C., has just brought out a process called "Nameit," for naming negatives with type, which is easy to use. He will forward full particulars on application.—CAILLOU.

4646. **Names on Negatives.**—Write on a piece of paper with aniline ink, or print on it with an india-rubber stamp. Place the paper, while still wet, face downwards on the film side of the negative and rub your nail over it several times. Then remove the paper and you will find the name left on the negative. Printer's ink will do it if used before dry, when printed on ordinary paper. But it is a very objectionable practice.—R. A. B. BENNETT.

4649. **Smallest Stop.**—In reply to "Charles," the larger the stop used the better is the atmospheric effect. Therefore use the largest stop which will give sufficient definition; the size of this stop will depend on the subject and the taste of the operator.

As these are variable quantities, it is necessary for every one to make a few experiments for himself; f/18 and f/23 are, however, much used.—J. G. P. VEREKER.

4650. **Camera Case.**—Waterproof canvas is the cheapest and lightest material for a camera case, and is strong enough if not used very roughly. I think the Civil Service Stores charge about 15s. for a half-plate case.—CAILLOU.

4651. **Warwick and District.**—In answer to above, I must say that you could not have chosen a prettier place to take some views. At Warwick there is the Castle, which makes a beautiful view, taken from a dozen or more positions, then the old streets and gate that used to lead to the old town. Be sure and photograph the Castle from the riverside; from the landing-stage of the Rowing Club makes a beautiful view. After you have spent a day in Warwick, turn your attention to Hatton, Kingswood, Solihull, Olton, and Knowle. All these places are simply superb for good landscapes and old buildings.—H. S. B.

4651. **Warwick and District.**—Warwick is full of interesting subjects for photography, viz., the Castle, Leicester's Hospital, the old gateways; then, proceeding to Guy's Cliff, take views of the mill, the house and piers, Gaveston's Monument on Blacklow Hill; then on to Kenilworth to take photographs of the Castle, returning through Stoneleigh take views of the Abbey, the Grove, and Ashow Church, then in Leamington take views of River Walk, the College, and the Jephson Gardens. In Stratford-on-Avon take photographs of the interior and exterior of the church where Shakespeare was buried, the house where he was born in Henley Street, and where he lived, called New Place, also the Memorial Theatre and Anne Hathaway's cottage at Shottery, about three miles from Stratford. Returning to Warwick, visit Charlecote Park and Sherborne Church.—IDA ASTON.

4652. **Intensifier.**—Bichloride of mercury does not readily dissolve in water, but if some of the mercury is left at the bottom of the bottle so as to form a saturated solution, it will bleach the negatives, if they have been freed from hypo. Wash them well after bleaching, and flood with ammonia or sulphite of soda solution, either of which answers equally well.—CAILLOU.

4652. **Intensifier.**—Is "H. S. B." certain he got the bichloride of mercury (corrosive sublimate), as, owing to the atomic weight of mercury having been doubled, there is, I have understood, sometimes a confusion? If he got the chloride of mercury (calomel), it is insoluble in water. He would not be able to dissolve 2 oz. of bichloride of mercury in 6 oz. of water, as it would require 32 oz. of water to make a cold saturated solution, and though it might dissolve in 6 oz. of boiling water it would crystallize out as it cooled. "H. S. B." had better buy some fresh salt and ask for corrosive sublimate. Ammonia answers perfectly for blackening the film, but the negative ought to be well washed after whitening.—J. G. P. VEREKER.

4653. **Colour in Landscape.**—I should say "Aitch Gee" had better use orthochromatic (or isochromatic) plates for his purpose and a yellow screen. He might get a fair representation with ordinary plates and a deep yellow screen, but the colour-sensitive plates would be more satisfactory and require probably a shorter exposure. The depth of colour for the screen depends on circumstances and had better be found by experiment. Use the developer belonging to the plates, modified, if necessary, for the effect desired.—J. G. P. VEREKER.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

S. W. HARRIS.—It is always a risky job removing the varnish from collodion positives. We should advise you to copy it in the camera. If you are careful in lighting it, to avoid the reflections from the glass, you ought to obtain very good results.

G. B. P.—The usual method of removing the gelatine from old plates is to place them in a hot, strong solution of washing soda. Another good plan is to soak the plates in water till soft, and then use a paste made of pumice stone powder and glacial acetic acid; the first is the cheaper. We should find it rather a difficult task to answer your second query, and we make it a rule never to answer anonymous writers. Send your name and address, and we shall be pleased to help you. Will not our advertisement pages help you? Every good worker should prepare his own developer; he knows exactly what he is using then. See our leader of this week.

A. B. C.—We should not advise you to take lessons; you would find full information in our back numbers, which, if you have not got, we will look up, and our publishers will send you on receipt of price.

**V. SUTHERLAND.**—The yellow stains and patches on the prints you send are undoubtedly caused by bleaching of the image by sulphur compounds, formed by the decomposition of the hypo by the acid bath. The dark flashes may be due to old paper, dirty dishes or measures, a trace of hypo. You do not keep your prints in the acid bath long enough; five minutes in one acid bath, followed by the same time in two fresh acid baths, washing for half an hour, and then fixing, is the correct way. The precipitate caused by adding No. 2 to No. 1 proves one of three things—(a) your iron is too strong, (b) the oxalate is too weak, (c) the solutions are too acid. Which is it? Always pleased to help you.

**A. JANE.**—You are quite right; the quantity should be 20 oz., and not 2 oz. See our note this week on home portraiture development.

**W. H. W.**—It is utterly impossible to give you any instructions on the subject in this column. We will give you a special article shortly on the stripping of films, but the photo-mechanical part is quite beyond our limits of space. Send us a stamped addressed envelope, and we will write you.

**H. S. W.**—We will test paper and report in next week's issue.

**WESTPHALIAN.**—We should advise you to send to Chadwick, 2, St. Mary Street, Manchester, who makes a speciality of stereoscopic work; also Lancaster, of Colmore Row, Birmingham, and Underwood, of Granville Street, Birmingham, have good stereo outfits. You could obtain one of Lancaster's whole-plate extensions for enlarging; for prices, see our advertisement pages.

**K. G.**—Professional bellows-makers generally use stiff glue, but a diamond cement would suit your purpose very well. Try the following:—

Gelatin ... .. ½ oz.  
Isinglass ... .. 1 „  
Distilled water ... .. 6 „  
Soak for six hours, occasionally stirring, then add  
Glacial acetic acid ... .. 2 oz.  
And stir well, and melt by the aid of a water bath, or by placing in an outer vessel of hot water. When all dissolved, finally add

Spirits of wine ... .. ½ oz.  
Carbolic acid ... .. 6 drops.  
When required for use, melt by placing the bottle or jar in boiling water.

**ERNEST WINN.**—Your friend in Germany should see Griffin and Sons' new hand-camera, Dine's patent; but if he requires a hand-camera to use with dark-slides or roll-holder, nothing in the market beats Shew's Eclipse camera.

**G. C. J.**—You have omitted name and address. Had you given them we would have written to you.

**JAMES THOMAS.**—Messrs Hart and Co, 186, Fleet Street, E.C., will give you every information with regard to taking out patents.

**G. F. W.**—We note your title, and will take care that our register is corrected.

**J. H. DALLMEYER.**—Thank you for the letter.

**H. E. GORDON.**—We have some notes in the press on the subject you enquire about. Very good results can be obtained by using Vogel's azaline tincture, to be had from Gotz, 19, Buckingham Street, Strand.

**CONSTANT READER.**—(1 and 2) It is difficult to say how much of the accelerator named would act as a poison. There are few chemicals which, when taken in excess, will not cause death; thus the carbonates of potash and soda if taken in larger quantities would act as caustics and destroy the mucous membranes of mouth, stomach, and intestines, setting up inflammation, and thus causing death. The antidotes are—produce vomiting by plenty of warm water, give vinegar or lemon juice, olive oil, the whites of eggs beaten up with water, gruel, demulcent drinks like linseed tea, etc., and give 20 drops of laudanum if in pain. Ferrocyanide of potash is not poisonous of itself, but is classed amongst poisons with all other metallic cyanides, because prussic or hydrocyanic acid can be so easily prepared from it. We therefore may say the accelerator is not poisonous.

(3) According to the Pharmacy Act, 1838, 31 and 32 Vict., c. 121, it is "unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons . . . in any part of Great Britain, unless such person shall be a pharmaceutical chemist or chemist and druggist within the meaning of this Act, and be registered under this Act, and conform to such regulations as to the keeping, dispensing, and selling of such poisons as may from time to time be prescribed by the Pharmaceutical Society with the consent of the Privy Council." As to the anomaly you mention, you must do your best to reconcile practice with the above cited Act of Parliament; it is beyond our powers. Chemists blame the apathetic Pharmaceutical Society, and one or two prosecutions and convictions have taken place but without any result to the general practice.

(4) You will find very full information, with the complete wording of all Acts which apply to chemists, poisons, etc., in the Calendar of the Pharmaceutical Society (2s. 6d.), published at 17, Bloomsbury Square, W.C., or a much more useful book is the "Chemists and Druggists' Diary" of 1891, published at 42, Cannon Street, E.C. The following are the Acts which will help you: The Pharmacy Act, 1852, 15 and 16 Vict., cap. 56; the Pharmacy Act, 1868, 31 and 32 Vict., cap. 121; the Pharmacy Act, 1868, Amendment Act, 1869. The

above Acts do not apply to Ireland, which has separate Acts of 1870 and 1890.

**SEWARD.**—The pyro is all right; send us up a little more of the bromide, though this, we think, is all right also. We should be inclined to put the fault you complain of down to the score of water supply to your house. The prize medal slides were made as follows: Well's Cathedral on Thomas' plate with pyro and soda, Christ Church on Thomas' plate with pyro and ammonia.

**DR. RINGROSE ATKINS.**—Letter dated April 30th, 4 p.m., only reached our office on May the 5th!

**E. GRIFFITHS.**—You will find Messrs. Griffin and Sons, Garrick Street, W.C., most prompt in executing orders for photographic oddments, or the Blackfriars Sensitising Company execute orders for all classes of goods. You would get good detail on their "Celerotype" paper.

**HENRY ELLIS.**—It is impossible to fix an exact date, but we shall hope to do so very shortly.

**E. G. G.**—We will advise you when by post card.

**ARTHUR B. CARRE.**—At the moment we cannot lay our hand upon the letter about the proposed photographic society for Guernsey. Send us a letter for publication, and we have no doubt many of our subscribers might help you to form a society.

**H. C. R. HARLEY (India).**—The photograph you send is perfect in selection, but is, as you say, over-printed. When you get some fresh paper and the temperature is lower, send us over another print. We shall write you by an early mail. By all means open a small deposit account with us, and we will buy and send out photographic oddments to you. We are often doing so for subscribers abroad.

**T. T. S.**—(1) This print is, we should say, from a well exposed rather thin under-developed negative; the print itself is grossly over-printed and over-toned. (2) Correctly exposed negative, print over-toned. (3) Over-exposed. (4) Correctly exposed. (5) Correctly exposed; if you cut off an inch of the foreground you will have a perfect little picture. Shall we return your prints?

**G. PROSS.**—Lancaster's See-saw shutter is just what you want.

**L. PABST.**—You could use block-tin trays for developing with pyro, but not for iron or fixing or toning.

**H. TAYLOR.**—Chlorhydric acid is hydrochloric.

**S. GLAZIER.**—It is always a dangerous practice to tamper with a lens, and we could hardly answer your question without seeing the lens; still, you might try.

**W. W. PARKINSON.**—(1) There is not much choice; if any, No. 2. (2) The exposure meter cannot of course be absolutely and scientifically correct, but it is the nearest approach yet made.

**J. B.**—You are quite correct; the lenses we named are quite sufficient for all work.

**OSCAR.**—The developer depends a great deal upon what you are going to do, positives or negatives. A good all-round developer is:

(A).  
Sulphate of iron ... .. 240 gr.  
Sulphate of copper ... .. 30 „  
Distilled water ... .. 5 oz.

(B).  
Nitrate of baryta ... .. 30 gr.  
Glacial acetic acid ... .. 30 drms.  
Methylated spirit ... .. 5 oz.  
Distilled water ... .. 5 „

Dissolve A and B separately, then mix and filter. A good fixer is:

Cyanide of potash ... .. 120 gr.  
Water ... .. 10 oz.

Jabez Hughes' "Principles and Practice of Wet Plate Photography" is the best handbook; to be had from our publishers, price 1s.

**PERCY VEE.**—Letter by post.

**BEE.**—Your best plan would be to ask the local board surveyor. Place your siter at N.E. end, the glass and blinds should be on the north-west side.

## Monthly Competition.

### RIVER SCENERY.

Title of Photograph.	By whom sent.
Our Village Brook ... ..	L. White
Marlow Bridge ... ..	J. A. Booth

## Quarterly Examinations in Photography.

### QUESTIONS.

16. An exposed plate will be forwarded to you; develop the same, and send a silver print from it with statement of method of development, etc. (No further information will be given as to exposure, etc., and the negative must be retained for future work.)
17. Define the term "Amateur" as applied to photographers, and state clearly your views on the subject. (350 words allowed.)
18. Forward a short article upon some "Holiday Resort," complying as far as possible with the rules laid down in "Our Views," p. 310, May 1st, 1891. (350 words allowed.)

(Latest Day for Answers—May 18th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, OREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. **Halfpenny Stamps preferred.** A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.**

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," etc. — AMATEUR PHOTOGRAPHER, vols. ix. to xiii., each in reading case; for 7s. 6d.—No. 149, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

AMATEUR PHOTOGRAPHER, 90; "Photographic News," 26 numbers (consecutive); Hunt's, Marion's, Hepworth's, and Lancaster's "Photography," two "Year Books," 8s. 6d.; as new. — Knight, High Street, Godalming.

**Burnishers.**—Lancaster's half-plate burnisher, perfect order; cost 21s.; price 15s. — H. Kinnaird, 171, Caledonian Road, London.

Useful burnisher for sale; 6s.; nearly new.—Peirce, Gonville, Blackwater Road, Eastbourne.

**Cameras, etc.**—Camera, half-plate, new, reversing swing-back, compound front, rack and pinion adjustment, one double dark-slide; cash only.—Head, 30, Chapel Road, West Norwood.

Stirn's Secret camera, nickel-plated, six pictures on plate, scarcely used; 15s.—W. Cook, 43, Binstead Terrace, Leeds.

Superior quarter-plate mahogany studio camera, double back, and stand; 15s. 6d.; or exchange for 9 in. burnisher. — Fowler, Park Lays, Stratford-on-Avon.

4½ by 3½ Gale's Cyclone camera, with three double dark-slides and waterproof bag, in good condition; cost £6 10s.; price £5.—No. 155, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Watson's 6½ by 3½ stereo camera, with three double dark-slides, in leather case, with lock and key, in splendid condition, cost £8, price £6; also Ashford tripod stand, price 15s.—No. 154, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Lancaster's quarter-plate Le Merveilleux, complete, two double backs, rebounding shutter, and one of Tylar's metal slides; what offers?—No. 153, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Slide-making camera, half (no lens), slide carrier (double), half dark-slide; 10s.; or offers.—Howard, 16, Perryn Road, Acton.

Useful to cyclists, Mayfield's 3½ square ebonite Pocket camera, backs, shutter; 27s. 6d.—Summers, jun., 23, Cheapside, London.

Shew's Eclipse camera, brass-bound, lantern plate size, with three beat double backs, pocket rest, and folding leather case, the whole as new; cost £7 9s. 6d.; price, lowest, £5; approval if deposit; will forward above to Editor for approval if required.—No. 152, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Shew's quarter-plate Eclipse camera, four double backs, finders, etc., complete, equal to new; also light bamboo stand and leather case; cost £6 16s.; the lot for £4 15s.—A. Parker, Uttroxteter.

Best half-plate long-extension bellows camera four slides, 4-fold stand, £5 5s.; also quarter-plate bellows camera, four slides, £3 3s.—L. 87, Cobden Road, South Norwood, S.E.

**Cameras, Lenses, etc.**—Lancaster's latest pattern extra-special half-plate, brass-bound, triple extension camera, three brass-bound double slides, Universal top, sliding tripod, splendid rapid rectilinear lens, iris diaphragm, guaranteed as new; cost £9; sell £3 15s., or without lens, £5 5s.—Address, G., 2, Crafton Terrace, Kingstown.

Genuine bargain to any gentleman requiring a complete and first-class make outfit. Camera, 7½ by 5 (by Meagher), with extending front, rising and sliding ditto, with partition for stereos, reversing swing-back, and all the latest improvements, three double dark-slides, rapid rectilinear lens (by Taylor), extra strong tripod, all new last autumn; also the following sundries: quarter, half, and 7½ by 5 printing frames, paper mache and iron enameled dishes, glass shapes, zinc vignettes, burnisher, background, measures, light-tight boxes, carriers, focussing piece, view-finder, and cases, condition guaranteed as new, in one lot only £12; camera and slides alone cost £10 15s.—G. Sanders, 30, Seymour Street, Liverpool.

Whole-plate long-extension camera, three backs, best make, R.R. lens (iris), Kershaw shutter, 3-fold stand, all in mail-cloth case, as new; £11; list price £15 5s. 6d.—Dr. Cecil Shaw, Hon. Sec., Ulster A. P. Society, Belfast.

Lancaster's half-plate Instanto, three double dark-slides, tripod, lens and shutter, with solid leather bag, 80s., cost 134s.; Watkins' actinometer, 10s.—Jones, 83, Milton Street, Middlesex.

Lancaster's quarter-plate Le Meritoire, with lens, double dark-slide, stand, focussing cloth, and leather-bound case, as good as new; price 35s.—E. A. Yates, Percival Street, Oldham.

Half camera (by Meagher), extends full 17 in., two double slides, with special baskets, lined with waterproof material for carrying, £4 10s.; Dallmeyer's rapid rectilinear, 6 by 5, £3 10s.; Dallmeyer's W.A. landscape lens, 7½ by 4½, £2 10s.; Kershaw shutter, fits hood 1½ and under, 10s.; all in good condition.—A. Spiller, Hillside, Hampstead Hill Gardens, London, N.W.

Rouch's whole-plate portable leather bellows camera, double extension, double swing back, reversing rack, rising front, in new condition, one double mahogany dark slide, book form, and ash folding tripod, R.R. lens, covering 10 by 8, the lot for £6 10s.; also whole-plate portrait long-focus lens, covers 12 by 10, only 35s.; also half-plate outfit, £1.—Knight, Seaford, Sussex.

**Camera Case.**—Will sell for 9s., carriage paid, waterproof case, to hold complete half-plate outfit.—4, Eaton Street, Hanley.

**Dark Slides.**—Six full-plate brass-bound McKellen's dark-slides, new; best cash offers.—S., 52, Greenhill Street, Manchester.

**Hand-Cameras, etc.**—No. 1 Kodak, with leather case, quite perfect, loaded with 100 exposures; price £2 15s.—R. Seymour Benson, Stockton-on-Tees.

Kodak for sale, cost £5 5s., about 40 undeveloped films; price £3.—Dr. Hodges, Park Road, Gloucester.

Samuel's half-camera, quarter-plate, carry one dozen plates or films, achromatic lens, time and instantaneous shutter, quite a bargain, almost new; 41s.—Robson, Eye Infirmary, Exeter.

Quarter-plate Diamond detective camera and case, nearly new; price 30s.—Bennett, Walton Lodge, Oxford.

Shew's famous quarter Eclipse hand-camera, six double backs, finder, bamboo tripod, all perfect; cost £8; price £1 10s.—B. 43, St. Helens, Lancashire.

**Lantern.**—Mahogany-body optical lantern, 4 in. condensers, blow-through jet, brass front, double pinion, lens, and carrier, quite new; price 9s.—268, Intake Road, Sheffield.

**Lenses, etc.**—Cabinet portrait lens, nickel-plated, 25s.; Inkpen's walking-stick tripod, 7s. 6d.—J. C., 65, Albert Road, Southsea.

9 by 7 R.R. lens, good make, nearly new; price 30s.; specimen photographs can be seen.—Adams, 34, Courthouse Road, Haverstock Hill.

Whole-plate rapid rectilinear lens, f/8; bargain, 35s.—14, George Street, Stroud, Glos.

Lens, rectilinear, 7 by 5, covers grand to edges, hood, stops f/8 to f/32; 25s.; approval.—Adams, Hermitage Mews, Stamford Hill.

Two first-class rapid rectilinear lenses. Waterhouse stops, quite new, perfect definition; quarter-plate, 17s. 6d.; half-plate, 23s. 6d.; approval.—M., 73, West Clowes Street, Salford.

Portrait lens, quarter-plate, good definition, 15s.; dark-room lamp, new, 5s. 6d.; approval.—Drinkwater, Malvern Hill Road, Birmingham.

Half-plate R.R. lens; 27s. 6d.—Gregg, Water Street, Egrement, Cheshire.

Ross' half R.R. lens, almost new; 75s.; or exchange Dallmeyer's whole-plate W.A. doublet.—H. Cooke, 3, Weekday Cross, Nottingham.

Wide-angle doublet lens (Ross, London), 3 in. focus; cost £4; sell for £2, or exchange for hand-camera.—253 Intake Road, Sheffield.

Suter C3 lens, in leather case; cost recently 104s. nett; take 84s.—Rev. Christie, Newtownstewart, Ireland.

Ross' 4 in. portable symmetrical, good condition; 37s. 6d.; no reasonable offer refused.—Rev. Henning, 18, Whitehead's Grove, Chelsea.

**Roll-Holder.**—Eastman's roll-holder, whole-plate, little used; £2 10s.—M. Powell, 76, Springfield Road, Preston Park, Brighton.

**Sets.**—Lancaster's quarter-plate outfit, nearly new, 30s.; induction coil, 2 in. spark, commutator, vacuum tubes, brass model engine and boiler; offers. 190, Heyside, Royton.

Lancaster's half International set, complete with

R.R. lens; approval, cash.—Pridden, Jeweller, Weymouth.

Camera, full-plate, best quality extension, for sale, fitted with every convenient appliance, two lenses (Ross), four double dark-slides, carriers, Eastman's frames, tripod, in two portable strong leather bags, instantaneous shutter, and complete outfit, with dishes, printing frames, lamp, etc.—Half-plate do., London Stereoscopic Co.'s best make extension and outfit. Owner will initiate, by correspondence, any purchaser unacquainted with photography into its rudimentary mysteries.—Apply, Excelsior, Florence Villa, Portswood, Southampton.

Watson's half-plate set, light Tourist camera, three double dark-slides, two fronts, R.R. lens, iris diaphragm, Thornton-Pickard shutter, sliding tripod, leather case, focussing cloth, glass, and level, new last season; cost £15 15s.; price £8 15s.—Address No. 150, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Shutters.**—Optimus half-plate plunge shutter, only used twice, perfect condition, owner requires larger; price 23s.—Adams, 34, Courthouse Road, Haverstock Hill.

**Slides, Lantern.**—Advertiser wishes to exchange lantern slides for others of equal quality.—Smitu, Yewdale, Huyton, Liverpool.

200 best photographic lantern slides, travel, scientific, humorous, etc., to be cleared at half-price, particulars free; also a splendid Tourist's telescope, 2 in. objective, in sling case, almost new, cost 63s., sacrifice for 32s. 6d.—T. Hall, Pinfold Lane, Lancaster.

**Sundries.**—Complete plant and appliances for colotype, nearly new; price £10 10s.—Apply Colotype, care of AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

For sale or exchange, plated revolver and a telescope.—No. 148, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Bargains, 500 cream enamel cabinet mounts, red line, 2s. 100, lot 9s.; 500 ditto c.d.v., 1s. 100, lot 4s. 6d.; whole-plate single lens (Lawley, London), 10s. 6d.; exchange half-plate wide-angle rectilinear.—J. Barrack, Central Buildings, Kendal.

**Tripod.**—Three-fold tripod (by Morse), with case, suit half-plate camera, new; 15s.; cost 28s. 6d.; a bargain.—W. J. Barker, Woodley View, Leeds.

## WANTED.

**Cameras, etc.**—Half-plate camera, complete, with latest improvements, cheap for cash.—Fullest particulars to T. Lewis, Tebbury, Gloucestershire.

**Cameras, Lenses, etc.**—Who's and half plate cameras, lens, stands, printing frames, etc., posing chair, etc.; approval.—Price and particulars to A. Macdonald, Myra Street, Keswick.

Quarter-plate Lancaster's Instantograph, rectilinear lens, or other good camera, with dark-slides and stands, on approval; must be cheap; or exchange detective hand camera and cash.—F. Jermyn Smith, Peterboro.

7½ by 5 or 8½ by 6½ long-extension camera and slides, also lens; approval; deposit; full particulars.—Shepherd, Ripley, Derby.

**Dark Room.**—Amateur wants to rent a comfortable dark-room, neighbourhood of Charing Cross preferred; state terms.—No. 151, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Dark Slides.**—Quarter-plate dark-slides for Lancaster's International.—Summers, 148, Staunstead Road, Forest Hill.

**Hand Cameras, etc.**—No. 3 Kodak, Junior, must be perfect and loaded.—R. Seymour Benson, Stockton-on-Tees.

No. 3 Junior Kodak camera, No. 2, and No. 1; state lowest cash price.—Thos. Illingworth and Co., Kodak Finishers, 35, Sherriif Road, West Hampstead, London.

Shew's Eclipse hand-camera, cheap.—W. 10, Pembroke Road, Notting Hill.

Quarter-plate Shew's hand-camera, in good condition.—Naylor, Warwick Road, Basing.

Swinden and Barp's detective camera, in good condition, cheap for cash.—A. C. G., 47, Huskisson Street, Liverpool.

Facile hand-camera, with rapid rectilinear lens.—Dyer, Elmfield, Ilfracombe.

**Lantern.**—A good enlarging lantern, which will also act as good magic lantern.—Waller, Banagher, Ireland.

**Lenses, etc.**—Voigtlander's rapid Euryscope, No. 5 or 6, or No. 4 or 5 Suter's A. applanatic for portraits and groups; state lowest price for cash and condition.—Vincent, 61, Dunca Road, Southsea.

**Shutter.**—Shutter, 2½ in., either Thornton-Pickard, Kershaw, or other good.—Moussay, Savile Park Halifax.

Instantaneous and time shutter, 3 in., modern 10 by 8 camera, studio stand, with rack adjustment, Ashford's 6 in. tripod; approval; deposit.—Studio, Beacon, Camborne.

**Sundries.**—Three or four dishes, not less than 15 by 12, for cash.—J. E. Blam, Yarm.

Really good toning bath for Aristotype prints; send formula for six stamps.—Deegan, Banagher, Ireland.

## NOTICES TO SUBSCRIBERS.

*Subscriptions must be prepaid.*

## NOTICES AS TO ADDRESS.

**PUBLISHING DEPARTMENT.**—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the AMATEUR PHOTOGRAPHER are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

**NOTE.**—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

**ADVERTISEMENT DEPARTMENT.**—All communications respecting TRADE Advertisements in the AMATEUR PHOTOGRAPHER are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.  
NOTE.—Trade Advertisements are received up to Tuesday morning.

**EDITORIAL DEPARTMENT.**—All Literary Contributions, Queries and Answers, Photographs for competition or Criticism, Books or apparatus for Notice or Review are to be addressed to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.  
NOTE.—To ensure insertion, all Communications should reach the Editor on Tuesday.

**CORRESPONDENCE SECTION.**—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the EDITOR, AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

# THE "AMATEUR PHOTOGRAPHER" COMPETITIONS, 1891.

The Dates given below are those upon which the Competitors' work must actually be received

JUNE	1	...	Monthly Photographic	...	...	...	VILLAGE LIFE, FARMING, ETC.
"	17	...	Public Schools	...	...	...	Particulars to be announced.
"	30	...	Photography at Home	...	...	...	Particulars to be announced.
JULY	1	...	Monthly Photographic	...	...	...	OUT-OF-DOOR FIGURE SUBJECTS, GROUPS, ETC.

Further Particulars, Entry Forms, etc., will be sent on receipt of stamped envelope.

Address: THE EDITOR, "AMATEUR PHOTOGRAPHER,"

1, CREED LANE, LONDON, E.C.

**NOTE.**—ALL APPLICATIONS TO BE ENDORSED, "COMPETITIONS."

## KING'S POPULAR HAND CAMERA.

Defies Competition in Price, Quality, and Artistic Results.

No. 1, **25/-**

No. 2, **35/-**

No. 1.—Holds 12 quarter-plates automatically changed by one movement, made in best mahogany, Time and Instantaneous Shutter, Two Finders, Vertical and Horizontal. No. 2.—Same as No. 1, but with extra View Finder, same size of plate. All Amateurs should order at once for Whitsun Holidays. No need to take out ordinary Camera, as with this you can see exact picture you are taking. CATALOGUE TWO STAMPS.

**E. A. KING, Works, 3, Chester Terrace, Eaton Square, S.W.** (3 minutes from Sloane Square, 5 mins. from Victoria District Ry.)

Before placing your orders, write for particulars of the

## "CLIMAX" HAND CAMERA,

Particulars from JOHN WATSON, 34, Grainger Street, Newcastle-on-Tyne.

No Black Bags, Double Dark Slides, or Separate Chamber. Approximate size, 10 by 4 by 4½.

"WATSON & JOHNSTON'S" PATENT. True automatic changing, carries 18 ¼-plates, smallest and most portable. You will be sorry if you purchase before seeing the "CLIMAX." One movement only. It is impossible to describe its simple movement. It requires seeing to be believed. Competent judges declare it to be the very acme of simplicity.

**NOW READY. Price 2s.**

## "THE PHOTOGRAPHIC QUARTERLY."

CONTENTS FOR APRIL, 1891.

With Woodburytype Frontispiece, and Eight General Illustrations.

THE CAMERA'S SERVICE TO ART. By JAMES STANLEY LITTLE.

HUSBAND'S PAPYROTINT PROCESS FOR LITHOGRAPHY IN HALFTONE. By Capt. A. M. MANTELL, R.E.

MEMORY AND IMAGINATION, By H. ERNEST MURCHISON.

*Illustrated.* Pure Photography—Photography Aided by the Brush.

THE RELATION BETWEEN ABSORPTION AND SENSITIVENESS OF SENSITIZED PLATES. By J. J. ACWORTH, Ph.D., F.I.C.

*Illustrated with Diagrams.*

IDEALISM, By FRED. DAVIS.

THE TEACHINGS OF A CHEMICAL ACTINOMETER. By CHARLES A. KOHN, Ph.D., B.Sc.

ROUND EUROPE. By CYRIL S. COBB, B.C.L., M.A.

*Illustrated.* Constantinople from the Golden Horn: Stamboul Side—Constantinople from the Golden Horn: Galata Side—Odessa: The Fort—Kieff: Cathedral of St. Sophia—Kieff: Church of St. Michael—Kieff: Cathedral of the Assumption.

SUMMARY OF EVENTS INTERESTING TO PHOTOGRAPHERS. By the EDITOR.

FRONTISPIECE.—"THE LOVE LETTER." By JOHN E. AUSTIN.

LONDON: HAZELL, WATSON, & VINEY, 1, CREED LANE, LUDGATE HILL, E.C.

## COMPETITION.

TWO GUINEAS are offered for each of the best series of 5 PHOTOGRAPHS BY AMATEURS illustrative of either of following places:—

Edinburgh, Dublin (and vicinity), Belfast, Irish Scenery, Glasgow (and Clyde), Bath, Brighton, Torquay, also of Still Life, *apropos* of either, River, Sea, or Country.

Not more than two principal Architectural Views admissible, the other three to be typical scenes, artistically and unconventionally treated.

SHARPNESS AND CLEARNESS OF OUTLINE REQUISITE.

COPIES NOT LATER THAN JULY 15 TO

AUTHOR, care of HAZELL, WATSON, & VINEY, LD.,  
1, CREED LANE, LUDGATE HILL, LONDON.

Advertiser reserves the right of publishing such as may be accepted.  
Those unaccepted returned.

## THE "NORTHERN GARDENER" PRIZE COMPETITION.

The Proprietors of the  
"Northern Gardener," 64, Fountain Street, Manchester, offer

£2 for the best Six,  
£1 " " Three,  
5s. " " Single,

Unmounted Photographs of Gardening Scenes (in Private Gardens or Public Parks), Porches, Windows, etc., of a picturesque character, Plants, Flowers, etc.

Competitions to reach the above address not later than June 27th, 1891.

All Competitive Prints, which must be original, to be the property of the Proprietors of the "Northern Gardener," who reserve the right to publish same. The Prize takers will be announced in the *Northern Gardener* of July 4th, 1891.

## "AMATEUR PHOTOGRAPHER" COMPETITIONS. PHOTOGRAPHY AT HOME.

PRIZES FOR PAST WINNERS:

One Gold, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal. One Silver, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal,  
One Bronze, "Niepce," 1st AMATEUR PHOTOGRAPHER Progressive Medal.

OPEN TO GENERAL COMPETITORS:

Two AMATEUR PHOTOGRAPHER Gold Medals. Two AMATEUR PHOTOGRAPHER Silver Medals. Two AMATEUR PHOTOGRAPHER Bronze Medals.

Certificates will be placed at the disposal of the Judges should they see fit to award them.

All Photographs must be endorsed "Photography at Home," and sent, on or before Tuesday, the 30th of JUNE, 1891 addressed to—

The Editor, AMATEUR PHOTOGRAPHER,  
1, Creed Lane, London, E.C.

## PUBLIC SCHOOLS COMPETITION. OPEN TO BOYS UNDER SEVENTEEN YEARS OF AGE.

Class I. Landscape. "Amateur Photographer" Silver and Bronze Medals.

II. Portraits, including Groups " " "

III. Animals " " "

IV. Architecture " " "

NOTE.—Entry forms now ready. Send stamped addressed envelope, endorsed "Competitions," The Editor, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, London, E.C.

Latest date, June 17th.

The Largest Sale of any PHOTOGRAPHIC WASHER in the World!!!

WOOD'S PRIZE MEDAL

Washer and Adjustable Rack.

IMPROVED PATTERN.

The most rapid "HYPO" Eliminator in the Market.

"A very excellent Washer,"—*Amateur Photographer*.

"Washes prints with less attention and more thoroughly than any we have yet seen."—*Photography*.

"I find prints and plates are free from 'Hypo' in the time you claim—a fact I should not have credited without actual trial."—W. JEROME HARRISON, F.G.S., Author of "A History of Photography," and "Photography for All," etc.

"Your Washer works splendidly."—FRANK M. SUTCLIFFE, Whitby.

JAMES WOOD, Chemist, 18, Northbrook St., LIVERPOOL.

## Ladies' Second Photographic Competition PRIZES.

FIRST PRIZE. SECOND PRIZE. THIRD PRIZE.  
GOLD MEDAL. SILVER MEDAL. BRONZE MEDAL.

(These Medals, of the smaller series, will be appropriately mounted as Brooches or Pendants if desired).

SUBJECTS: Landscape or Seascape—Landscape with Figure—  
Portraiture or Figure Study.

NOTE.—Entry forms now ready. Send stamped addressed envelope, endorsed "Competitions," The Editor, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, London, E.C. Latest date August 22nd.

## "NAME IT"

(PATENT)

A NEW & PRACTICAL PATENT

For producing Names, Numbers, or Descriptions on Photographs.

SIMPLE! ECONOMICAL!! EFFECTIVE!!!

Box No. 1, with full instructions, 10/6 } Post  
Box No. 2, " " " " } Free.

Full particulars and Specimen Photo, showing Result of Process, FREE.

A. GRAY (G. DEPT), 44, SNOW HILL, LONDON, E.C.

## CROUCH'S LENSES

For Landscape, Interiors, Stereoscopic Work, or for any special requirement, Trade, Professional, or Amateur.

WRITE FOR ILLUSTRATED CATALOGUE, ETC., WITH PARTICULARS, TO

HENRY CROUCH, Ltd., 66, BARBICAN, E.C.

TO H.M. GOVERNMENT, OXFORD, CAMBRIDGE, AND LONDON UNIVERSITIES, Etc., Etc.

For Hand Cameras see "Crouch's Presto." Carries 24 plates, instantaneous change, no bags. Full particulars on application.

## POWELL'S PYRO "DEVELOPOIDS" SOLD EVERYWHERE.

The "BRITISH JOURNAL OF PHOTOGRAPHY" says:—"It is a highly convenient form in which to keep PYRO, and we can strongly recommend it."

Sole Agents—

Messrs. MARION & Co., 22 & 23, Soho Square, W.

Sole Maker—

T. H. POWELL, 116, Denmark Hill, London, S.E.

## ARCHER'S NEW OPTICAL LANTERNS (BOTH OIL AND LIME-LIGHT)

Have proved by Public Competition to be superior to all others.

NEW ILLUSTRATED CATALOGUE NOW READY,  
POST FREE, 1d.

We would remind our readers that entry forms are ready for the "Photography at Home" Competition, which takes the place of "Home Portraiture," and on receipt of stamped addressed envelopé a form will be sent. In this competition portraits, figure studies, groups, tennis parties, etc., are eligible. It is, as a matter of fact, a "go-as-you-please" competition, and one which we hope will be largely supported. The winners of prizes in the AMATEUR PHOTOGRAPHER "Monthly Competitions" are eligible in the class "Open to General Competitors." Past prize winners of the AMATEUR PHOTOGRAPHER Gold Medal must enter in the Special Class, in which gold, silver, and bronze "Niepce" or first AMATEUR PHOTOGRAPHER Progressive Medals will be awarded. The last date for sending in has been fixed for the 30th of June.

THE *New York Herald* is responsible for the statement that a company has been formed at Cleveland, Ohio, with a capital of a million dollars to work a patent for taking photographs at a distance by means of electricity.

MR. WALTER SICKERT has addressed the following letter to the Editor of the *National Observer* :—

"I have waited to see whether one of the art-critics who have noticed the exhibition of sketches of India by Mr. Menpes would make the slightest allusion to the fact that they owe their drawing almost entirely to the use of instantaneous photography. It is hardly possible that they should not know this. It is the *secret de Polichinelle* of the studios. Any one who cares to examine the sketches now at Messrs Dowdeswell's gallery can see this for himself. Contrast, for instance, the accuracy of contour of the architectural details, which can be photographed, with the helpless treatment of skies and trees where the camera notably fails to supply sufficient guidance. I do not propose to enter into discussion with those—and I believe there are many—who defend the use of photographs under paintings on either artistic or commercial grounds. I would suggest, on the other hand, that a critic fails in an obvious duty to those whose drawing is the result of special gifts of brain and eye and hand, arduously and painfully cultivated, when he discusses such an exhibition as Mr. Menpes' without premising that his initial drawing has throughout been done for him by a machine. Beyond this, that he fails in his duty to the public, who pay him for an expert opinion. The public buy pictures, among other motives, because they think they will rise in value. They rise in value, among other cause, if the artist progresses in power; and an artist who spends the best years of his life in colouring or copying tracings of instantaneous photographs does not progress."

We will express no opinion upon the subject, but it would be interesting to hear what others have to say; and perhaps some of our readers who are artists and have seen Mr. Menpes' work will give us their views upon this alleged use of photography.

MR. W. FENTON JONES, the Hon. Secretary of the Hackney Photographic Society, in thanking us for our comments upon his work, and that of the society which he has done so much to advance, says: "Next session we intend starting the meetings at 8 to 8.15 for minutes, after which half an hour will be set aside for the criticism of members' work, and thus ensure mutual benefit. We know for a fact that in some societies members are afraid to bring up their work, but at Hackney they evidently wish to encourage beginners by friendly criticism."

It will be remembered that last year the *Lady's Pictorial* reproduced the prize photographs in the "Ladies' Competition." We are very pleased to say that the Editor has asked us to reserve them for his paper this year. We shall be glad to send entry forms to our many lady subscribers upon receipt of stamped addressed envelope.

A VALUABLE paper has been contributed by M. Guntz to the current number of the *Comptes Rendus*, in which he

proves the existence of the subhaloids of silver, the existence of which, though strongly suspected from a theoretical standpoint, has never yet been satisfactorily proved. We have already noted the formation of the subfluoride of silver,  $\text{Ag}_2\text{F}$ , which M. Guntz obtained about nine months ago by electrolysis of a solution of silver fluoride. By the action of the chlorides of carbon, silicon, and phosphorus on the crystalline subfluoride, comparatively pure subchloride,  $\text{Ag}_2\text{Cl}$ , of deep violet tint is formed. The subiodide  $\text{Ag}_2\text{I}$  was prepared by passing gaseous hydriodic acid over the subfluoride, and the subsulphide  $\text{Ag}_2\text{S}$  was obtained by the action of sulphuretted hydrogen. The suboxide of silver,  $\text{Ag}_2\text{O}$ , itself was obtained by heating the subfluoride with aqueous vapour. M. Guntz proposes to compare his subsalts with those prepared by the action of light on the several haloid salts, and we may thus hope for some further and authoritative light upon the vexed question of the latent or invisible photographic image, and the coloured product obtained by printing out with chloride of silver.

—♦♦♦—

THE glories of Switzerland are every year becoming more familiar to travellers, who will enjoy the extremely clever pictures of Mons. G. Loppé. This artist is now exhibiting at the Fine Art Society seventy-six choice examples of the painstaking and artistic way in which he has studied the Alps. To those who know Zermatt, the studio of M. Loppé will recall delightful experience of this artist's work. In his determination to picture Mont Blanc with fidelity, he made the ascent sixteen times, and we are rewarded with a splendid view of sunrise upon the "King of Mountains." The depth of blue in the furrows of the Mer de Glace, the rose-pink of dawn upon the grim Matterhorn, the glow of sunset in the Valley of Chamonix; all these are pictured by M. Loppé with marvellous skill. As a specimen of smooth painting we specially commend a view of Mont Pilatus from Stansstadt. Even while we stand gazing at the various canvases, there come to mind the lines of Matthew Arnold:—

"Swiss chalets glitter'd on the dewy slopes,  
And from some swarded shelf, high up, there came  
Notes o' wild pastoral music—over all  
Ranged, diamond-bright, the eternal wall of snow."

—♦♦♦—

If we are to believe the daily papers, we have no longer any need of the sun; this luminary's nose has been put decidedly out of joint. Photographers, both amateur and professional, will rejoice, no doubt. We shall soon only have to press the button and obtain a light compared to which the sun will be nowhere. We refer to the following passage which refers to the Naval Exhibition at Chelsea:—

"The New Eddystone is an exact model, so far as size and outward appearance goes, of the great beacon-light designed by Sir Jas. Douglass, that stands upon the rocky ledge, the outmost landmark of England's shores. It is 170ft. in height to the top of the lantern, and there is a passenger lift built within the iron inner structure, by means of which visitors will be enabled to ascend to the gallery encircling the light. At night a mighty 5,000,000 candle power electric lamp will illuminate the grounds from the summit of the lighthouse."

The italics are ours. We have not yet had an opportunity of seeing this wonderful light, but according to Bouguer sunlight is equal to 62,177 wax candles of the normal standard. Anyone will now be able to reckon out that this "mighty 5,000,000 candle power electric lamp" is more than eighty times brighter than the sun. We have begun to consider whether we shall not lay in an extra stock of plates, as we shall be able to do some good work now, without any consideration of night. But won't there be a rush for rapid shutters! The candle power of the arc-light varies from 2,000 to 6,000 candles, so that we should require over 800 arc-lights of 6,000 candle power.

IN another column we give the AMATEUR PHOTOGRAPHER'S "Tourist Index," which we venture to think will be of considerable value to our readers. The reference is made either to an article ("Holiday Resorts and Photographic Haunts"), a letter, or an answer to queries in the AM: PHOT: There are references to some 250 places, and it only remains with our readers to make the "Tourist Index" cover a thousand centres of photographic interest. We publish the list for two reasons, first, in order that intending contributors shall know what places of interest have been written upon in the columns of the AMATEUR PHOTOGRAPHER, and secondly, because subscribers using our "Dark Rooms" may be glad of the opportunity of securing a copy of the AMATEUR PHOTOGRAPHER which contains an account of the district they are visiting.

We shall be glad of short MSS., about 500 to 1,000 words, descriptive of any good centre for photographic work. Our readers in the provinces will be rendering a great service to their less fortunate fellow-workers who dwell in the large cities by describing the many lovely spots which are within such easy reach of many of their homes.

—♦♦♦—

PHOTOGRAPHIC societies are now arranging their summer excursions, when excellent work is done. It appears to us that much benefit would be derived by the exchange of invitations between the neighbouring societies, and that the friendly intercourse of members of different societies is much to be desired as being likely to advance photography and engender a spirit of emulation between workers in photography.

Whilst upon this subject we should like again to call attention to the desirability of societies having permanent rooms, and to the immense benefit that would be derived, especially in seaside towns and holiday centres, of granting temporary membership to members of any photographic societies or to persons introduced by, say, ourselves. We are sure that if such a course were generally adopted it would be much appreciated by the many hundreds of ladies and gentlemen who are on photography and pleasure bent.

—♦♦♦—

THE Birmingham Photographic Society hold annually a prize competition and exhibition entirely limited to the work of their own members. We note that this year there are no less than thirty classes; in every one prizes are offered, many by the society and the remainder by prominent members. The photographs receiving prizes remain the property of the society. The Birmingham workers in photography are very successful; the society is a large one, and thoroughly representative of photography.

Rumour has it that a photographic club is to be formed, but we do not think, taking into consideration what the existing society has done, that the scheme will be successful, especially as it is matter of common knowledge that amongst the promoters there are men who are not at all popular in photographic circles in Birmingham.

—♦♦♦—

OUR readers may not generally know that six prizes for photographs are offered by the Art Committee of the National Eisteddfod of Wales, which will be held at Swansea in August this year. The classes are: (1) "Figure Subject." (2) "Landscape"—in both classes a gold medal or seven guineas. (3) "Views of Ancient Buildings, S. Wales," (4) "Views of Gower," (5) "Ships in Motion," (6) "Waves"—in all these classes a prize of a silver medal or three guineas will be given. The Editor of the *British Journal of Photography* will act as judge in all classes. Further particulars may be obtained of Mr. J. W. Jones, Hon. Secretary, Arts Committee, 20, High Street, Swansea.

ON Tuesday evening M. Leon Vidal read a paper before the Photographic Society of Great Britain on "Photographic Methods of Obtaining Polychromatic Impressions." For the purposes of the meeting a considerable number of coloured prints were fixed upon the walls of the room, in all of which photography played a more or less important part, and many of them were artistic and very attractive. Specimens were contributed by the Photochrome Co., Zurich; Frisch, Berlin; Goupil, pictures from the *Figaro Illustré*; Löwy, Vienna; Haufstaengl, Munich; Rommel and Co., Stuttgart; Rouillé, Paris; Wezel and Naumann, Leipzig; and a landscape by Mr. Bligh Bond, which, however, is not a good specimen, the several printings not being in accurate register. Messrs. Rommel's sheet of Dresden figures showed charmingly soft colours. The public will be admitted to view the exhibits on presentation of visiting card.

### HOME PORTRAITURE.

WE have considered briefly the single figure, and noted a possible chance of a group indoors. We have now to consider some general principles to be observed in out-door portraiture.

There is one background which is very common and is by no means artistic, that is a trellis work, sometimes partially covered with ivy, jessamine, or Virginia creeper, which is too often sufficiently thrown out of focus to make the interstices of the trellis round, patchy spots, which attract the eye before the figure or face. Ivy, Virginia creeper, or any other plant or a shrub may form a very pretty artistic background, but it should never be as sharply focussed as the sitter, nor sufficiently fuzzy to lose its outline and character. Never take your sitter standing against a wall, the top of which just comes across the back of his neck; this gives one an idea of the guillotine or block, which is not pleasant. Always look carefully, too, to see that there is no obtrusive branch or flower which apparently grows out of his neck or the top of his head. We have a most curious example of amateur portraiture in which the sitter, a lady, wears a hat trimmed with some flowers, and from the position she is placed in it looks for all the world as though she was supporting a whole rose tree on her head.

A sitter should never be placed in the sun, nor under a tree through the branches or leaves of which the sun shines on him in patches, or the resulting prints will give one the idea of a piebald sitter. Very good results can frequently be obtained by placing the sitter in the angle of a wall facing the north or north-west; but it is far preferable to use a lawn studio, such as sold by Prouting, of Tilehurst. We have used one made on the same principle for some time with the best results. With such a studio one can command the lighting, and obtain results otherwise impossible, and the cost is but small.

Out-door work gives us very good chances for happy groupings, and we shall note one or two possibilities, leaving our readers to carry out more fully the ideas we sketch. Tennis parties are capital opportunities, not only for flirting, but also for group work. Thus we may have two gentlemen, one in the act of tossing, the other watching him; and two young ladies standing together having a confidential chat, and "Tossing for Partners" will tell the story. In the background we can place a group of on-lookers, and perhaps a couple quietly walking down a path or across the grass for a quiet tête-à-tête. Afternoon tea out of doors, again, affords us another capital subject—the tea-table, the presiding divinity and her attendant satellite, then two or three pairs scattered about, but near. Here one must apply to a great extent the well-known rules of composition, which are easily mastered. Whatever you do, carry out the idea

well. Do not crowd everybody together; give some tea-cups, others plates, etc., and fill cups and plates; and don't let all your sitters look straight at the camera; let them chat to one another. Again, in out-door work there are plenty of chances of making a pretty picture with children, either singly or in groups at play, or at the swing, etc., and far greater success can be usually obtained, as the light is more even and stronger, and therefore a somewhat slow shutter may be used.

The fortunate possessor of a flight of stone steps leading from the house to a drive has a capital chance of artistic composition, especially if riding hacks can also be had to order. Thus we may plant a gentleman half way up the steps, looking into the hall of the house through the open door or impatiently at his watch, and make a groom lead a pair of hacks up and down, and a title such as "Impatient" or "How much Longer am I to Wait?" tells the tale. A very pretty little study can be made from a cavalier arranging the riding habit of some fair dame, whilst a groom holds the horse. Then, again, we have the forlorn maiden watching her lover riding away, or anxiously looking for him. There are hundreds of such subjects to be found, with a little care in posing so as to conceal the art, and probably one or two failures may be met with ere success, and a picture crown the efforts.

To the fortunate visitor to farmland there are subjects innumerable ready to hand; they only want seeing, that is all; such subjects as feeding calves, poultry, etc. Then again, many a homely yokel with his work-a-day smock will make an excellent subject, but too often the operators seem blinded by familiarity or false pride, never thinking that in such homely and true to nature pictures there is the one touch of nature that makes the whole world kin, and that such scenes which may fairly take their place in a competition such as our "Photography at Home" are far superior to the stiff and inartistic work too often a libel on the poor sitter.

**Messrs. Underwood and Co.,** of Birmingham, have just appointed an agent in London (Mr. D. R. Duncan, 186, Fleet Street, E.C.), where all their special cameras and photographic apparatus may be inspected. In an early number we shall refer to their goods again.

**Messrs. Spiers and Pond, Ltd.**—Few of our readers will be aware of the enormous extent of business done by this firm, and many will, we are sure, know for the first time through our advertising columns that the firm have an extensive photographic department at their central stores, which is well worth a visit. The standing of the firm is quite sufficiently well known to assure amateur photographers that whatever work is undertaken will be well done, and everything they supply of the very best.

**Gotz's Cameras.**—We drew attention a short time since to the excellent cameras turned out by Mr. Gotz, of 19, Buckingham Street, Strand, W.C. We understand that he has quite recently sold the Duke of Marlborough a whole-plate kit, also one of his "Fairy" cameras, with all the mounts made in aluminium, and that he has prepared a specification for a 15 by 12 kit. It may not be generally known that Suter, of Basle, was the first lens maker who adopted the standard (U.S.) numbers of the Photographic Society of Great Britain, a lens of five and a half inch focus will start from  $f/6.6$ . A very large business is being done in these lenses. Suter was also the first maker to use Jena glass. Mr. Gotz is his agent in this country.

**The "Talmer" Automatic Camera.**—It will be noticed that Messrs. Talbot and Eamer are offering a special discount of 5 per cent. for cash to all purchasers of their improved automatic "Talmer" Cameras, provided they receive the order on or before 18th inst. Further, they undertake to send the cameras carriage paid. The firm have a large stock of cameras ready packed, they expect a very large sale, and have made special arrangements for despatch immediately on receipt of order. It is not Messrs. Talbot and Eamer's custom to give discounts, but they are making an exception, because they have a good stock of cameras on hand. We may add here that the "Talmer" is a cheap camera, and thoroughly reliable. No one regrets giving £3 10s. with landscape lens, or £4 12s. 6d. with R.R. lens for such an admirable instrument.

## Letters to the Editor.

### RE SOCIETY AT STREATHAM.

SIR,—I see in your issue for last week a note about the formation of an amateur society for Streatham. I cannot but think that too many societies within a small area is a mistake.

The North Surrey Society, which was the pioneer society for this part of London, and is, I believe, the oldest existing society South of the Thames, is within twenty minutes' walk of Streatham, and there is a good train service between Streatham and Tulse Hill station, which is two minutes' walk from the society's rooms.

Since the North Surrey was started, new societies have sprung up in Dulwich, Brixton, and Clapham, but I am sure that better work would be done if these societies were to unite in some central position and form a South London Camera Club, with a club house of their own.—Yours faithfully,

HAROLD SENIER

(Hon. Secretary, North Surrey Photo. Soc.)

### THE EXPLOSION OF A GAS REGULATOR.

SIR,—I have read the letters in your paper *re* the above. Mr. Soames is entirely wrong, and in every respect the hydrogen was not turned on, and the question of mixed gases is out of the question. The first firing took place, as you can see, on the neck of the regulator where the collar joins. An explosion of mixed gases could not very well have acted on that, and besides, there would only have been the explosion and no fusion further. I had not even tried to light the hydrogen, as I have already said, and was adjusting the oxygen piping. There could have been no cumulative pressure, as each time I found it leaked—*i.e.*, the collar—I took it apart, thus allowing all gas to escape. I am inclined to accept your theory, with Mr. Horton's. Some minute particles of iron filings got in the cylinder, and their being forced through the narrow neck generated heat (we know the affinity of iron filings to oxygen); this heat or fire being started, found some hydro-carbon, and the direct cause of the explosion was the heated air. At the best we can only theorise; but the explosion followed the turning of the tap, as quickly as the falling of the hammer of a gun produces the report. I should add that there were two friends helping me who have had a considerable experience with lanterns; both of these are perfectly satisfied, first, that there was no light near, and further that the mixed gas theory will not hold. I would like Mr. Soames to examine the regulator, and he will admit he is wrong. My delay in replying to his letter is explained by my being in the United States—Yours truly,

HENRY D. BRANDRETH.

New York, April 28th, 1891.

### WHAT IS AN AMATEUR?

SIR,—You have just now got a very bad attack of this ancient complaint, which breaks out so frequently in a fresh place with undiminished energy. I trust it may soon run its course, and leave no evil effects behind it. My own views are expressed so nicely in the letter of Mr. G. H. P. Burne that it would be really sinful to take up your space by restating them, though I am not in the happy position of being mentioned by "An Inquirer," as I have never attempted to exhibit at a public exhibition. Had I done so, prices—and "reasonable" ones too—would have been affixed to my prints. Let me apply the principle of Mr. Francis Clarke to a practical case. You can now buy the materials for making a camera for one shilling. Let us say that a youth of the tender age of nine or ten—whom we will call Brown—does so. Brown, having made the camera, takes a shot at Jones's sister, a lady blessed with a fair share of nature's charms, and the result, though not up to exhibition standard, is at any rate recognisable. Jones thereupon wishes to possess a copy of his esteemed relative, but Brown declines to be bothered to print him one. Jones finally overcomes Brown's scruples by the use of a new sixpence which his aunt has bestowed on him as a birthday gift. Brown instantly blossoms into a full-fledged professional! Bravo! An *enfant terrible* indeed!

For myself, I don't trouble my head about this point. I have sold many of my photographs at reasonable prices (any price would be reasonable for these gems). I intend to sell many more if requested to do so. I shall, nevertheless, call myself an amateur all my days, unless I enter the trade. Other people can call me exactly what they please. But if Mr. Francis Clarke's

reasoning is to hold good, then besides being a professional photographer, I am (1) a professional chemist, (2) a professional electrician, (3) a professional author, (4) a professional watch maker, (5) a professional mounter of microscopic objects, (6) a professional naturalist, (7) a professional printer! I believe I am also a professional tinker, but I am not quite sure about that. Yet such is the frightful denseness of my family and all my friends, that if asked what was my profession they would reply without a moment's hesitation that I hadn't any. As a matter of fact, I am continually being asked what profession I intend to take up. Will people never be satisfied?—Yours faithfully,

REGINALD A. R. BENNETT, B.A.

### STEREOSCOPE.

SIR,—I should be much obliged if any of your readers could tell me of any London firms who supply open achromatic stereoscopes, capable of being used with prints which are each 3 by 4, and which are fitted with eyeshades.—Yours, etc., STEREO.

## Studies in Art for Photographers.

BY REV. F. C. LAMBERT, M.A.

### CHAPTER VII.

#### CONTRAST.

WE have yet to consider one of the strongest elements of all art work, viz., *contrast*. A moment's glance at the structure of any great work of fiction, the drama, music, in short any of the means which appeal to our senses, will show that contrast lies at the very root of our receiving sensory impressions. Rest is only thoroughly enjoyed after labour. After the monotony of silence how pleasant is a tuneful sound or familiar voice! Darkness is even grateful and restful after the strong glare of a noonday sun. In short, it is by comparison and contrast that we enjoy not only our aesthetic sensations, but also to a great extent are enabled to form our ideas. The words light and dark are notions of comparison. For instance, the dark shadow of a midsummer sun is bright compared with the glint and gleam of a full moon.

To limit ourselves for the present to contrast as applied to pictures. And first, let us be careful to note that, as in all great principles, the idea may be presented in many forms. For instance, we may apply it to the estimation of lines. It is by contrast of the straight and the curved that we are enabled to perceive the niceties of fine distinctions. As the zig-zag is a contrast to the straight line, so again the straight line is a contrast to the curve; and even again among curves there is much force of contrast, as, for instance, between the circle and ellipse or the spiral and parabola. What we have already described as balance in the direction of lines is, in truth, a matter of contrast of direction.

Again, the force of contrast is felt among forms, the round (spherical) and the square; the regular, say of a crystal, and the amorphous, as of clay. Who has not noticed the wearisome monotony of the boulders or pebbles on the beach, and how one angular bit of rock seems a welcome relief?

It will appear at once to the observant that as monotony produces a feeling of weariness and weakness, so in the same way judicious contrast keeps up interest and conveys the feeling of strength.

There is yet another way, perhaps the most powerful of all (pictorially), in which contrast strikes an effect at once, viz., in the matter of light and shade. It is curious to notice that many writers on art seem, as it were, to limit the notion of contrast to chiaroscuro, and ignore this element or factor in any other direction. The comparative study of art shows this to be a mistake,

Now in the matter of contrast of light and dark it is customary to tacitly assume that Rembrandt was the discoverer of this idea. There can be no doubt that he did use it with truly wonderful success, but at the same time with a keen knowledge; and it is the want of this latter qualification which leads so many of his feeble imitators into quagmires and pitfalls. It may be questioned whether in some cases Rembrandt has not strained truth for effect, but even granting that he has used an artist's license, it cannot be denied that it has been done with a master's hand. It is a matter of regret that his honoured name has been tacked on to a certain mannerism in professional portraiture, lending as it were a fictitious sanction to results which are sometimes terrible enough to stir his sepulchred bones. *Requiescat in pace!* This much, however, the observant photographer cannot fail to learn from an intelligent study of Rembrandt's paintings and etchings, viz., that vigorous contrast in lighting gives the spectator an impression of strength and directness of work. Be it observed how the dark gets darker and darker as it gets nearer and nearer to the point of extreme contrast, and in the same way so does the light grow lighter and lighter.

This is due partly to an optical effect and partly to the actual gradation of light values. The following very simple experiment is worth the making, and will illustrate the point under consideration. Take a piece of paper, white, but not of the very whitest; also a piece of dull black or nearly black paper. Now, in a fairly good and diffused light, bring them together so that the white overlaps part of the black paper. It will be observed that the white seems to get whiter and the black to get blacker as they approach the junction. Take now a piece of grey paper and hold this against the black, and observe the relative tone values. Now slide your piece of white paper between them, so that the grey is separated from the black by a strip of white, and observe that this white strip makes each of the other two appear darker. Quickly draw away the white separating strip, and note that the grey seems to grow lighter than before. In such simple ways may we with profit study the effect of contrast.

No one knew better than Turner the great value of contrast. How often may we observe a dark tree against the strongest light of the sky. In fact, this device has led some giddy scoffers to call it "Turner's great tree trick."

Several of the later French painters have used a dark figure against the sky with the best effect.

There is yet another way in which contrast may be introduced with telling force, viz., in the sentiment or theme of the picture. An illustration will make this clear. Suppose, for instance, the subject be chiefly pathetic—say a mother nursing a sick or dying child—the pathos will be strengthened by the *tasteful* introduction of some opposing sentiment; say a kitten playing with the neglected doll of the sick child. The proper use of this element requires the highest skill, lest it run into *bathos* and destroy all *pathos*: for truly a gossamer line separates the sublime from the ridiculous. The employment of contrast in sentiment is, again, a most powerful device in the drama and also in fiction—and in this latter realm few can compare with Dickens in his skilful introduction of suggested humour amid the most pathetic surroundings.

It may not be out of place, however, to give a note of warning to the photographer, lest he run away with the idea that any contrast means strength and vigour, and be tempted to under-expose his negatives and produce "soot and whitewash" prints. One must be most careful to distinguish between hardness and contrast; the former is a vice, the latter a virtue. The former often means spotti-

ness, the latter breadth—the former weakness, the latter strength.

As a general rule, one may say that we can only have one area of vivid contrast, *i.e.*, where, by skilful selection, we bring the deepest dark close to the brightest light. Other minor contrasts may and no doubt will exist, but the law of principality will teach us to so contrive matters that there shall be one, and only one, great contrast, and that it shall be where the chief interest is, so that the eye not only may be drawn to that point, but may be disposed to dwell there—at any rate, for a while.

Who does not know the power of a velvet cap for an old man to partly cover his scanty grey locks, and keep the eye resting on the face, instead of wandering over his enfeebled form?

Closely connected with this subject, we may direct attention to the arrangement of the subordinate masses of light and dark. It will be observed that if this be done so as to avoid any strong secondary contrasts, and so that the vigour be thrown into the one chief leading contrast, then it would seem as though this plan lengthened the *scale* of light and shade, *i.e.*, produced the effect of a greater range or number of gradations between the highest light and the deepest dark. And the reason for this apparent result is probably due to the effect of the strongest light and dark in sharp opposition, each intensifying the other.

As a matter of actual practice and work in the field it will *generally* be found that the best effects of breadth and contrast are obtained when the chief source of lighting is *rather* towards the front, so that the shadows are cast somewhat towards the spectator; but if this be carried to the excess of having a "front light," the effect is apt to be harsh and crude; while, on the other hand, if the light be behind the spectator there is seldom any vigorous contrast, and very frequently a general flatness and feebleness throughout.

(To be continued.)

## Photo-Micrography.—IX.

BY ANDREW PRINGLE.

### TREATMENT OF CERTAIN SPECIFIC KINDS OF OBJECTS.

It may to a considerable extent facilitate the early experiments of our readers if I give more or less definite suggestions as to how certain classes of objects not infrequently met with may be treated. It is, of course, impossible to give definite instructions for the treatment of any particular object, for one of the pleasures of our science is, that no two objects are exactly alike in every respect, and skill is shown in suiting our treatment to our objects. No doubt there are numbers of objects which in a general way may be placed in the same class so far as the best treatment is concerned, but it will soon be found that in order to attain the best results from a number of subjects, some variation will be required in our method of work.

I am not able to say which of all the kinds of preparations sold in our opticians' shops are the favourites with the beginner of photo-micrography; but certainly such objects as insects and diatoms are strongly in favour. Now, in my opinion, insects are in ninety-nine out of a hundred cases very bad subjects for a beginner; they are certainly large in most cases, but they are almost always of a very bad colour for photography, and the various parts of the insects

NOTE.—Mr. Pringle has kindly consented to answer any questions on photo-micrography. Letters should be addressed care of Editor.

generally lie in different planes which entails great and insuperable difficulty at the outset. Diatoms are very much more appropriate for early attempts, for they are practically without colour, and if suitable samples are chosen—fairly large and flat—and if we take the precaution to ascertain beforehand the exact appearance we ought to obtain, we shall know pretty well how near to a proper result we have arrived when our first negative or print is produced. I would suggest a good flat frustule of *Arachnoidiscus Japonicus*, for instance. It would be still better to choose some such object as a good thin section of deal or an *Echinus* spine, but I have reason to know that the beginner as a rule is averse to try really easy objects, his ambition is lofty and his knowledge of difficulty is small. I do not know any object more suitable than a section of deal, provided it is thin and laid flat. In such a case we have only to deal with so much opacity, and we have no puzzling colour to take into account. The power used should not be higher than one inch, and a low angle condenser should be used, as suggested in an earlier chapter. For objects presenting only light-obstruction without colour, ordinary plates should be used, and success depends almost entirely on proper exposure and development.

When we are working on diatoms, several matters have to be taken into account. In the first place, if we are to obtain results of any value we should endeavour to use as much angle as possible, in order that we may get a good amount of "resolution." If we are dealing with specimens of any great thickness or "depth," we shall soon get into the land of disappointment, no matter what method we follow in the hope of getting our images sharp all over; and of course the difficulty increases as the square of the magnification we are attempting. With the exception of this difficulty of depth, diatoms ought to be plain sailing, for we do not need to consider colour, and it is easy to tell a sharp negative when we have got one. This refers to the coarser kinds of diatoms; when we come to try "test" diatoms, such as *P. angulatum*, *S. gemma*, *N. rhomboides*, *A. pellucida*, and such like, we are in the regions of very difficult work indeed, and I do not recommend any one to try such work till he has attained a considerable amount of skill both in microscopy and in photo-micrography. In all our work, but especially in diatom work, the difficulty will at once be found when we come to deal with high angle or numerical aperture. It is not permissible to curtail the angle in order to get a "stronger" image; the widest available aperture must be used for "critical" work of this kind, and the exposure and development should be such as to give the pluckiest image possible without any blocking of the details. For such work I strongly recommend the quinol developer well restrained, the development not to be rapid, but to be carried to as great an extent as feasible without blocking the shadows. Intensification may be thought by some an advisable step, but it is not so; in my experience a diatom-negative intensified is almost always a negative spoiled. Plain plates are best for this work, and they should be of the plucky, density-giving quality, with plenty of emulsion on them.

When we are dealing with insect preparations as usually sold, we often find great trouble with the colours, which, in some cases, are really not fit for photography at all. But generally much may be done by the use of colour-correct plates, particularly if, as usual, the objects are of yellow colour. The required exposure in such cases is often very long. I have exposed on a flea a hundred-fold my average time for the magnification I was using. When, as is not at all uncommon, we have an insect with a deep yellow body and very pale transparent limbs, the difficulty is vastly increased. All I can say in advice is, expose for the dark

parts and keep the limbs, if you can, by careful development. In general, for insects use a colour-correct plate and no screen.

With very pellucid objects the invariable temptation is to cut down the aperture, and so to get a strong image on the ground glass; but we must not yield to the temptation more than is absolutely necessary. The skill in such cases is to get a good plucky negative with plenty of resolution. There are many pellucid objects which do not require any great angle to show all their structure, but even with such objects we must not shut off too much angle, because we shall then get a false or "structure" image. I had an example of this not long ago in treating a kind of parasite infesting human blood. This object is almost as clear as water; yet I had to use a considerable angle, otherwise I lost much of the worm's appearance. The only proper way to treat such objects is to keep down the exposure as much as possible and to use slow heavily-coated plates, using no more than the necessary angle.

The ordinary preparations emanating from medical laboratories are easy or difficult to photograph according as they are well or badly stained. Nothing photographs better than a logwood section if the staining is discrete and plucky. If the stain is faded or underdone, we may use a plate corrected for yellow, and a screen of yellow tint. Picrocarmin yields a stain well suited for our purpose when the stain is properly used, and when there is plenty of the picric acid left in the section; a colour-correct plate without a screen usually answers for such work, and the stain is to be recommended for our purpose.

When we come to consider the multiple stains that are now so common and so useful, we find ourselves in regions of greater difficulty. For instance, my own favourite stain for physiological and pathological subjects consists of bright blue, red and yellow, and I need not say that this is a very awkward combination to photograph, but I think that when it is photographed well no other combination can rival it for utility, for practically every kind of tissue is well shown. For such sections I always use colour-correct plates, and I use screens or none according to the proportion of the colouring in my preparations. If, for instance, there is a large proportion of deep blue unclear elements, no screen may be required; if red connective tissue is in excess, I may need a yellow screen to cut off some of the blue till the reds have time to impress themselves on the plate.

Bacteriological preparations are very frequently double-stained also, and here we have the added difficulty of having to use high magnification. Still, the general principles of treatment remain the same. If the stain is red alone there is no need to use any but an ordinary plate; but if we have a double stain or a faded stain we are almost forced to have recourse to colour-correct plates with or without screens. A faded preparation of gentian violet is common and puzzling, but it may be met with an orthochromatic plate and one or more screens. When a preparation is stained red and blue—a very common combination—a yellow screen will greatly facilitate matters even if an ordinary plate is used, though a colour-correct one is better.

Some objects are mounted in yellow media; use colour-correct plates for such, in order to get good dense ground.

It would be an endless business to attempt to cover *all* the ground under the heading of this chapter. I have tried to cover the commonest and the most important ground.

**West London.**—The annual smoking concert was held at the Richmond Hotel, Shepherd's Bush, on the 9th inst. The attendance was somewhat small, probably in consequence of the prevailing epidemic, but the entertainment was a good one, and was highly appreciated by those present.

## Our Contemporaries.

THE *Beacon* quotes from the Russian *Amateur Photographer* the following method of making "Photo-Mechanical Prints with an Ordinary Copying Press":—Herr A. V. Lavroff, the editor, thus describes his method for obtaining a cliché from which it is possible to obtain several hundred impressions in an ordinary copying press: "On a thick sheet of glass I obtain a cliché by means of bichromated gelatine, which, after developing, I leave to dry at the ordinary temperature for twenty-four hours, after which I flood it with the following 'bain mouilleur':"

Water .. .. .	100 cc.
Glycerine .. .. .	200 cc.
Hyposulphite .. .. .	2 grammes.

This is allowed to act from one to two hours, according to the desired relief. Then I remove the liquid from the glass by means of a very soft pad and blotting paper, and then I ink the cliché by means of a gelatine roller. The first pull or two are generally poor and are somewhat spoilt by the dampness of the cliché, but the subsequent impressions are excellent. In order to print in the copying press, I lay the ink clichés on a piece of india-rubber cloth, a mask of paraffin paper, and then the paper on which I wished to have the impression, and over this a thin bag of fine cloth filled with wadding. It is the use of this blanket which makes it possible to press the paper into contact, and to obtain all the fineness and details of the cliché. Of all the formulæ I have tried for the 'bain mouilleur,' I have found the above the best, as well for the relief as for the number of impressions. If after about twenty pulls the details of the high lights begin to show grey, one only need damp the cliché with a pad dipped in the same liquid, in order to make it as good as ever."

*Wilson's Photographic Magazine* gives the following hints for the use of palladium, instead of gold, in toning:—"The prints should be on ordinary salted paper and be printed deeply; very dense negatives with contrasts clearly defined, without hardness, however, are the most suitable. The image is first washed in pure water, then allowed to disgorge in a slightly alkaline bath (one to two per cent.), and finally kept in water for a few minutes. The print is then placed on a glass plate, the printed surface on top, sponged with a little bibulous paper, and the toning proceeded with; for this purpose a kind of brush is made by tying to the end of a glass rod a tuft of cotton; this brush, imbibed with the solution of chloride of palladium, is passed over the image repeatedly, until the red tones that it had acquired in the bath have turned to a sepia-brown, therefore it is necessary to go over the dark shadows oftener. The operation should be conducted slowly, so as to give the palladium time to displace the silver. The toned print, after washing in several waters, is then fixed in a hyposulphite bath at ten or twelve per cent., rendered thoroughly alkaline by a few drops of ammonia; the object of the ammonia is, by saturating the free sulphurous acid, to prevent the formation of sub-sulphurets of silver, which would cause the whites to become yellow. After fixing, wash in abundant water and dry between sheets of bibulous paper. The solution of chloride of palladium is made at one per cent. of water, and should be acid; and, if necessary, made so with a very small quantity of chlorhydric acid."

The *American Journal of Photography* gives the following curious dodge, which some of our readers may be inclined to try for themselves:—"An entirely new method of producing coloured silver prints, giving extraordinary results and effects, is published by Ogonowski in his book upon photochromy. The proceeding is as follows: Ordinary plain salted photographic paper is floated on the silver bath as usual, and printed faintly under the negative; it is then washed, toned, and fixed. This faint positive print while still wet is laid upon a sheet of absorbent paper; then both are placed upon a sheet of glass. The damp print, from which all superfluous water has been absorbed, is now worked in with water-colours, using only local tones, avoiding the use of flake white, vermilion, chrome and cadmium yellow. The print is now thoroughly dried; it is then albumenised one to three coats with salted, whipped albumen. It is then again silvered, and again placed under the negative, taking great care that the register be true. The print is now made similar to an ordinary albumen print, washed, toned, and fixed. The tints, being protected by the coating of the albumen film, are not

affected by the various processes. These tinted silver prints are said to produce the most charming effects."

*Anthony's Photographic Bulletin* says:—"The following method has been suggested for removing the yellow stain from negatives caused by prolonged development:—

Hyposulphite of soda .. .. .	1,000 grammes.
Water .. .. .	4,000 c.c.

To which is added—

Sulphocyanide of ammonium .. .. .	120 grammes.
Powdered alum .. .. .	30 "

This is allowed to stand for several days, being often stirred, after which add 150 c.c. of a chloride of gold solution, 1-200. This solution is then decanted to get rid of sediment and the stained negative soaked in it for a half hour, when the colour will be found of a beautiful violet-black or gray-blue tone, finely adapted to printing."

The *English Mechanic* says: "The bright nebula near the star Merope which Mr. Barnard thought had never been photographed probably because a sufficient exposure would so over-expose the star that the two images would coalesce, has, it appears, been photographed at Oxford, as Prof. Pritchard states in *Astronomische Nachrichten* that the nebula was plainly impressed upon a photographic plate taken at Oxford on Jan. 29, 1889, after an exposure of two hours. It also appears on several other plates, which were exposed from 20 to 120 minutes, and as the disc of Merope in those varies from 20" to 30" in diameter, while the nebula is about 40" distant, the separation is generally plainly marked."

*Wilson's Photographic Magazine* says: "The care of the lens should always command the greatest attention on the part of the operator. It is the most valuable, and often the most neglected, of all the photographer's working tools. Frequently it is left at the mercy of dust until its usefulness is seriously impaired. A sudden change of temperature is also very injurious to a lens, causing damp or moisture to form on the highly polished glass. If this occurs very often with the same objective and is not immediately removed, it will be found that a permanent mist or fog has spread over the surface, defying all attempts at removal. The lenses should occasionally be taken apart and cleaned with chamois, taking great care that the soft flint-glass is not injured. Positively nothing but chamois should be used in cleaning lenses, and under no circumstance should the surface be breathed upon. In conclusion, I would remind photographers that a poor lens is about the most undesirable article they could possess, and money invested in it is little better than thrown away."

## Thursday Evenings at the Camera Club.

(BY ONE OF OUR STAFF.)

MR. MACHELL SMITH presided at the meeting of the Club on the 7th inst., when a goodly number of members turned up to hear Mr. Willis discourse on "Clam-Chowder," and there was much hazarding of ideas as to what the paper was to be about. A few of the members had heard of the dish before, but the greater number were apparently innocent of any acquaintance with it. However, Mr. Willis soon explained his choice of title, by telling how he tasted clam-chowder in America. It is a great favourite on Coney Island, and the principal ingredient is clam, but there were many others which he had forgotten; the idea, however, was a sort of mincemeat or hotch-potch, which he warned them would be the character of his paper. He began the paper by repeating some remarks he had recently made before the P.S.G.B., in the course of which he pointed out that during the development of the print a portion of the ferrous image was dissolved out and diffused in the bath. If the reducing action was slow in proportion to the rate at which it was dissolved, the larger portion of the image would diffuse itself in the bath; if the reducing action were rapid, less salt would be diffused in the bath and more be available in the paper. The temperature and the strength of the developer both affected the rapidity of the process. At this point Mr. Willis showed a considerable number of prints developed with various developers, of various strengths and various temperatures, and pointed out that the lower the

temperature the shorter the scale of tones. If it were a fact that the gradation of a negative were absolutely fixed before development by the exposure given, it was equally certain that a good platinotype worker could vary the gradation of tone by modifications such as he had mentioned. He explained that the prints were on paper only two or three days old; he should have preferred it two or three weeks old, as it would have been better for the purpose of testing. The prints were treated in baths varying in temperature from 60 to 140 deg. F. The principal features in the cold bath were that the shadows were less intense, the middle tones were much reduced in strength, and the curve was flattened. The prints also required much deeper printing than for the hot bath. There was one point to be remembered, however, that no two rolls of paper agreed exactly, and in using the cold bath the paper must be handled very carefully, as finger marks were quickly made. If the development did not go very well, they should put the prints aside in a drawer for four or five hours before developing them. In the colder baths a slight difference of temperature had a greater effect than in the hotter ones. For instance, the difference between 60 deg. and 75 deg. was greater than between 100 deg. and 150 deg. Development also was slower in the cold bath. On the whole, he preferred the D solutions, oxalate and phosphate, as it was almost impossible to make a paper which would develop on the normal oxalate without giving grain. Mr. Willis then showed some exquisite prints on wood, which had been developed cold, and treated in various ways afterwards. Some were French polished, and some—the way he preferred—treated with starch sizing followed by boiled linseed oil.

Mr. Maskell wanted to know how long an oxalate bath would keep, and if it could be restored to its normal condition. Mr. Willis said it might be kept for ever; and although it was not wise to restore an old bath, it could be done by boiling it with a little carbonate of potash and then acidifying. His own practice was to pour the old bath into a bottle and replenish with fresh solution before using again. Mr. Dawson said he was now using the bath with which he commenced; he added ten ounces of fresh solution to it before using; it was a hot bath. Mr. Debenham was curious as to the keeping qualities of the paper, and Mr. Willis said he had seen paper eighteen months old which had been round the world, and then gave good prints; he had seen good prints on paper two years old; at six years old the whites were lost. The A (smooth) paper kept better than the B (thick). The Rev. F. C. Lambert was mostly interested in sepia paper, and was told that it would keep if anything longer than the ordinary. It was, however, a very uncertain paper, and he had never seen two batches alike. Mr. Davison was glad to learn that it was uncertain; they did not want it all cut and dried. Mr. Willis still recommended the addition of oxalic acid to the bath for the sepia paper. He preferred the oxalate bath to the D solution for sepia paper. Mr. Davison thought the special solution seemed to cool down the tone. By variations of the development they could get a brown black, a proper brown, or a purple brown on the sepia paper. In reply to the Rev. F. C. Lambert, Mr. Willis said he hoped, eventually, to make sepia paper in a continuous roll. Mr. Elder related some experiments he had made in varying the developer. Mr. Lyonel Clark said that by using a strong developer, a low temperature, and an alkaline bath he got a long range of tone which would do well for hard negatives. Mr. Willis advised them, if they wanted to make the best of a hard negative, not to use paper that was too fresh; and then great difference was effected by developing immediately after printing, and by leaving for some hours before developing. Dr. Patterson had seen some prints which had been made on paper which had been travelling in an open tube across the Atlantic since November. It was not quite so sensitive as the fresher paper. The Chairman said in his experiments he printed very deeply, and developed with one part of the normal developer to five of water, and got some very good results, but he found that the paper varied.

**Another Find of Platina.**—According to the *British Journal of Dental Science*, May 1st, p. 415, a unique discovery has been made in the form of arsenide of platina, a metal hitherto of very limited occurrence. The new metal has been named "Sperryolite," in honour of its discoverer, Mr. Sperry, and it is found by washing the sand, which yields 70 ounces of platina to the ton. If there is any considerable quantity of the metal, there would probably be a drop in the price of platinum.

## The Picture Galleries.

BY "LOITERER."

### ROYAL SOCIETY OF PAINTERS IN WATER COLOURS.

A PLEASANT exhibition of 238 pictures, all careful, many excellent, some charming, may now be viewed at the Royal Society of Painters in Water Colours. Mr. Paul J. Naftel sends three examples of his work. "Up the Stream to Idwal" (3) is, perhaps, the best of them. Miss Clara Montalba has fallen in love with Venice, as evidenced by the idealising of "An After-glow" (5). In "Squally Weather" (11) Miss Montalba displays her accustomed skill, while in "Monte Berico" (193) she journeys to Vicenza. It is interesting to imagine these talented artists dispersing over Europe, and yet further afield than Europe, like a band of swallows, and returning like "the flowers that bloom in the spring," with the results of their art. What dainty detail there is in Mr. Herbert Marshall's "Nymegen" (8)! Into "The Bridge at Dinan" (9) we think Mr. C. Gregory has crowded too many figures. All that classic architecture and surroundings can do for a picture is to be found in Mr. Lawrence Bulleid's various pictures, of which we like best "A Hymn to Eros" (10). Mr. Bulleid has been very successful in his treatment of marble. All that Mr. Albert Goodwin sends to this exhibition is worth noticing. Especially admirable is "Sion" (120). Mr. H. C. Waite, P.R.C.A., must be complimented on his felicity in treatment of "Crib Goch under Snow" (16). The delicate purple-pink of sunrise is beautifully reflected. Mr. Alfred D. Fripp has painted the "Knife-Grinder" (20) and "The Pet Gull" (28) with great skill, and both these pictures are very pleasant to look upon. Mr. R. W. Allan, who accompanied Mr. W. S. Caine on his recent tour through India and who is hard at work in India at the present time, is represented by seven pictures. One cannot help imagining that Barbara Burdas figures in "The Whelk Gatherers" (21). How the late Miss Linskill would have enjoyed this skilful sketch! There is a dreamy restfulness in Mr. R. T. Waite's "River Adur" (22), which seems to realise the Post Laureate's description of

"Such a tide as, moving, seems asleep,  
Too deep for storm and foam."

Two snow scenes by Mr. Wm. Collingwood must not be forgotten. The artist has been very happy in his presentment of "The Matterhorn" (40), whose awful splendour has lured so many an Alpine climber to destruction. Mr. T. M. Rooke's "Rue Moll et Rue Champeaux" (45) is distinguished for his adroit treatment of the prevailing tint. Some of Mr. Walter Crane's pictures, notably "Arbutus and Pine" (55), are rather unsatisfactory. Mr. E. F. Brewtnall has inspired his picture of "Christian and Evangelist" (60) with much dramatic interest. Mr. Charles Davidson's sketch of the "North Coast, Cornwall" (62) is good, and its companion, "January, 1891," shows Mr. Herbert Marshall's familiar touch. Mr. Bulleid is not so pleasing in "Custos Rotulorum" (76), which seems rather incongruous. In "Phocion or Myrtilus" (152) there is a bareness of surroundings which serves to accentuate the figure of the girl. Miss Edith Martineau's "Cottage near Haslemere" (75) shows a quiet care for exactness which deserves commendation. Everyone, we venture to prophesy, will agree as to the cleverness of Mr. E. A. Goodall's "St. Paul's, London" (101). An unusual view of Lucerne has been adopted by Mr. Albert Goodwin (111), which has at least the advantage of novelty. "Ben Nevis" (115) displays all the masterly ability which we expect and find in all Mr. Birket Foster's work. "The Vesper Bell" (157) is not particularly natural or effective. Mr. C. B. Phillip is successful in his picture of "The Bonawe Narrows of Loch Etive" (159). The quiet peace of Mr. T. J. Watson's "Beneath the Lime Tree's Shade" (160) is very pleasant. A historical picture—"The Lady of Lyons" (170)—shows that Mr. H. G. Glindoni can deal satisfactorily with such subjects. Mr. Arthur Melville gives us a clever impression of "The Procession of Corpus Christi at Toledo" (184). We must not omit to notice some characteristic sketches of birds (219, 226, 227) by Mr. H. Stacy Marks, R.A.

### MRS. ALLINGHAM'S DRAWINGS.

The pictures by the first (and only) lady member of the Royal Society of Painters in Water Colours—Mrs. Allingham—are worthy of the highest praise. She has depicted, in the eighty-

six examples now being shown at the Fine Arts Society's, the sunny side of

"The world which seems  
To lie before us like a land of dreams,  
So various, so beautiful, so new."

Following on Mr. Alfred Parson's "Gardens and Orchards" (and to which reference was made in these pages recently), the drawings by Mrs. Allingham have an individual delightfulness. Look at "May" (7), and you will feel the cooling hands of nature upon your brow. "A Surrey Cottage" (18) is charmingly true, while "A Sandy Lane" (19) proclaims the neighbourhood of Witley at a glance. A very pretty little picture is "A Visit to Grannie" (24). This has no reference to Miss Red Ridinghood's exploit. Mrs. Allingham has drawn "Gorse near Hambledon" (34) very finely indeed. In her sketch of Lord Tennyson's residence in the Isle of Wight (42) the artist has portrayed the venerable Poet Laureate standing in front of the house. It is interesting to recall the fact that the artist's husband, the late Mr. William Allingham, was a poet of high order, and the author of "Day and Night Songs." "A Cottage near Haslemere" (48) is most artistic, while the sunlight effect in "Under the Old Elms" (66) is admirable. For brightness combined with detail, the last picture is a capital specimen of Mrs. Allingham's drawings.

#### RAPHAEL'S CARTOONS.

Seven cartoons, which, it is claimed, were entirely designed and executed by Raphael for the Vatican tapestry, are being exhibited at 4, Cockspur Street, S.W. The titles of the cartoons are (1) "The Miraculous Draught of Fishes," (2) "Death of Ananias," (3) "Healing of the Lame Man," (4) "Feed my Sheep," (5) "St. Paul Preaching at Athens," (6) Paul and Barnabas at Lystra," and (7) "Punishment of Elymas." Without entering into the subject of the genuineness of these cartoons, which can only be decided by experts, we may say that in the sixth cartoon, particularly, there is a display of vigour and character in the whole treatment of the cartoon which would be wonderful if painted by any one other than Raphael. The cartoons are well worth a visit, for the dispute as to their painter will not affect the admiration of his art.

### Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

THERE was a good turn-out of members at the meeting on Wednesday night, 6th inst., of the Edinburgh Photographic Society. Mr. H. J. Blanc, the President, was in the chair, and introduced Mr. W. T. Bashford, Portobello, who made a communication upon "Allotropic Silver," on the lines of Carey Lea's latest pronouncement on the subject. Mr. Bashford submitted specimen plates which he had prepared, showing the effects which can be produced by silver in the allotropic form. Specimen papers were also handed round, illustrating the bright blue, gold, and other colours of this silver. The communication was entirely scientific in its nature, and did not deal with the application of the allotropic form of silver photography. A conversation which followed was taken part in by Messrs. Hume, M'Alpine, and Forgan. The latter stated that he had been privileged to see the plates which Mr. Bashford had shown, that he had subjected them to microscopic observation, and that he found, on scratching the film, that, though golden in appearance, the atoms of the silver remained unchanged, the solutions having only stained it, but that he was unable to speak of the substance chemically.

Mr. Bashford, in reply, said that all that was claimed by Carey Lea was that the gold-coloured silver showed certain reactions in certain chemicals which normal silver did not show. The moment the slightest shearing strain was brought to bear upon allotropic silver it changed to white. A microscope was not the apparatus, he submitted, to test the colours with; they wanted a spectroscope, which would indicate the nature of the colours. He had no argument, nor had he any desire to support any theory; he was only trying to show what Carey Lea believed he had discovered and what many scientists on the Continent believed that he had discovered, a new form of the application of silver.

On the motion of the Chairman, the Society recorded their sincere thanks to Mr. Bashford for bringing forward the subject.

Mr. W. Forgan, Bristo Place, then showed a Wray lens

mounted in aluminium, and gave an account of the improved methods of the manufacture of aluminium, which had resulted in its being cheapened, so as to become a commercial product.

Mr. W. Hume said he found that when the invoice for aluminium mounted goods came in, their price was not at the rate of 7s., but something like 50s. per lb. The price was therefore against the introduction of that form of mountant. In the case of opera glasses mounted in aluminium, he found that the lightness was due to the thinness of the metal, and that, in consequence, they were always getting dimpled and required to be repeatedly repaired.

The Chairman suggested that lenses might be mounted with a combination of brass and aluminium, the brass in the exposed portions, which would give both strength and lightness.

Mr. Powell showed several negatives which he had developed, some of which had been exposed and had lain in the slides for four years, and the others were of the same batch of plates, but had only recently been exposed. The developer he used was hydroquinone (Thomas's formulæ). The plates were manufactured in February, 1887. They showed no traces of fog, and he would like to know if any of the members had had a similar experience.

Mr. M'Kean said he had kept plates for seven years, and then exposed them, and they showed some of the beautiful colours that M. Lippmann had found.

Mr. W. Lamond Howie said he went into all sorts of places, some of them pretty damp. For under-exposed plates he used a pyro and ammonia developer, and when green fog appeared he found that cyanide of potassium and hypo took it all off.

The Chairman then called attention to the Saturday Rambles, the first of which is on the 16th inst., and said these events had been arranged by the Council so as to allow the members to get back to the city in time to keep other engagements or to develop their exposures.

A new photographic society has been formed in Edinburgh under the title of "The Edinburgh University Photographic Society." As yet it is not an extensive body, only containing about forty members, but that may be accounted for by the fact that membership is confined to the University Union. It is, however, already an influential body, the patrons, twelve in number, including Sir Wm. Turner and six other Professors in the University. Professor Crum Brown, the holder of the Chemistry Chair, is Honorary President. The President is Dr. Drinkwater, well known in Edinburgh as a careful and enthusiastic worker in photography. The objects of the Society are "to promote and encourage the practice and science of photography among its members (1) by means of excursions to places of interest, and (2) by furthering the practice of photography as an aid to medical and surgical study, and science in all its branches." It will be seen that the Society is intended to devote the larger amount of its attention to the scientific side of photography. While that is so it is an open secret that the Society has been founded because of the lack of activity which has for some years characterised the Edinburgh Photographic Society. The third meeting of the Society takes place this week, when Mr. Wm. Hume, Lothian Street, is to speak upon "Enlargements and Enlarging." It is evident that the Society means work, as they have already secured rooms in Bristo Place, in which they have the accommodation of a studio, a dark-room, a printing-room, and reading-rooms. In that respect they are the most efficiently equipped photographic society in this district.

At the last monthly meeting of the Brechin Photographic Society it was intimated that the Committee have arranged to allow visitors to have the use of the Society's reading-room and dark-room at the nominal charge of 1s. per month. The Secretary (Mr. J. D. Ross) read a short but instructive paper on "Stereoscopic Photography with a Quarter-Plate Camera." Although not advocating the use of such a camera for the best stereoscopic work, Mr. Ross pointed out that a stereoscopic camera is not essential to the production of stereoscopic slides, and in proof he exhibited a number of transparencies and other slides taken with a small camera, without extra top stand or any other extra apparatus. The paper was favourably criticised, and Mr. Ross was awarded the thanks of the meeting.

**Tunbridge Wells.**—At the ordinary meeting on the 7th inst., Mr. A. Marshall in the chair, Mr. C. Leeson Prince, F.R.A.S., F.R.Met.S., gave his experience of photography forty years ago, Mr. Oliver Rogers was elected a member,

# **“Amateur Photographer” Dark-Rooms, 1891.**

THE “DARK-ROOMS” kindly placed at our service for the use of amateur photographers are classed as follows:—

*a* Amateur                      *d* Dealer or professional.  
*h* Hotel                        *s* Photographic society.

NOTE.—At the time of going to press we have not received signed authority for the use of “Dark-rooms” marked\*; but they were all placed at our disposal last year, and are doubtless available.—Ed. AM. PHOT.

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and *plainly* endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

#### LABELS FOR BOXES OF UNEXPOSED PLATES.

The following list in different languages may prove of service to the tourist; it has been kindly supplied to us by Mr. W. E. Woodbury:—

*English*.—Sensitive photographic plates, which will be quite spoilt if opened in the light. Only to be opened in a totally dark room or by a red light.

*French*.—Plaques photographiques sensibilisées qui seront gâtées si on les expose au grand jour, par conséquent n'ouvrir la boîte que dans une chambre parfaitement obscure ou éclairée à lumière rouge.

*German*.—Photographische Trockenplatten, welche sehr lichtempfindlich sind Werden ganz verdorben wenn man sie dem Tageslichte ausstellt. Die Schachtel muss desshall nur in einem finsternem Zimmer, oder beim rothen Lichte geöffnet werden.

*Spanish*.—Las placas fotograficas sensitivas, que se inutilizan si se las expone al abrirlas a la luz del dia, se pueden abrir sin inconveniente en un cuarto enteramente obscuro o iluminado par luz roja.

*Portuguese*.—Laminas fotograficas sensitivas. Nao podem ser expostas á luz porque se inutilizam; podendo só ser abertas em camara, escura oce com luz vermelho.

## Reviews.

*Colour Measurement and Mixture*. By Captain W. de W. Abney. Published by the Society for Promoting Christian Knowledge, Northumberland Avenue, W.C., price 2s. 6d.

This little book belongs to the "Romance of Science" series, which, as the publishing society states, is "a series of books which shows that science has for the masses as great interest as, and more edification than, the romance of the day." Bearing this in mind, we are tempted to question whether Captain Abney's work will fulfil the object set forth, and we venture to think that it will not. The book is extremely readable, and leads us gradually through the whole subject of colours, giving succinctly the results of other investigators, as well as the author's own researches, but there is, we think, too much assumption that the reader is already acquainted with the fundamental principles of light and general science. We have read the book with great interest, and can thoroughly recommend it to all our readers, who will learn much of the most interesting of subjects, and one which is far more closely connected with photography than is generally supposed. The book is issued in good style, with a clear, easy-to-read type, and numerous illustrations are inserted to make the subject still more plain.

## Apparatus.

### POWELL'S PYRO DEVELOPOIDS.

MR. T. H. POWELL, of 116, Denmark Hill, S.E., has sent us a sample of his compressed pyro developoids, which we have tried with excellent results. They will form one of the most convenient adjuncts to the tourist's equipment, as it is merely necessary to dissolve one or two, according to the size of the plate to be developed, in water, and then the addition of four or six drops of liquor ammoniæ fort. 880 gives a pyro developer suitable for all brands of plates. The convenience of thus having pyro in such a portable form is obvious; there is no chance of breakage of a bottle of solution, and consequent staining of linen, clothes, etc., and the developoids are more convenient than dry pyro, being in smaller compass and no trouble of weighing or guessing. Comparative sensitometric trials prove them to possess equal developing power to plain pyro and considerably less staining property, and we can confidently recommend them as the most convenient form of developer for travelling and equally suitable for home work,

especially for those operators who prefer to make their pyro solution fresh each time.

### PAPIER VERMEIL.

Messrs. Cook, Shaw, and Co., of 15, Templeton Road, West Green, N., send us a sample of their new ruby medium "Papier-Vermeil," which they have introduced for dark-room windows. It is easily affixed, the window being well wetted and the medium being pressed into contact and rubbed flat from the centre outwards to remove air bubbles. It can be obtained in sheets 19 by 14 ins., post free for 1s. 3d., and should find considerable favour amongst our readers. We have practically tested the sample sent us, by affixing it to a sheet of glass in front of our lantern, and find that it gives a good safe light of great clearness, and a rapid orthochromatic plate developed for seven minutes, within 12 ins. of the same showed no trace of fog or veiling. The makers guarantee it to keep its colour, and at the price named it is by no means dear.

### THE "KOHN" TIME EXPOSURE MAGNESIUM LAMP.

MR. J. G. HUDSON has shown us some of the results to be obtained by the use of this lamp, which are most satisfactory. The lamp is so constructed that a series of flashes of instantaneous duration may be given, or one steady light kept up for thirty seconds. The magnesium powder is mixed with air before it reaches the flame, and so there is almost complete consumption and very little waste. The agent for the lamp is T. Newton, 77, Carlton Vale, Kilburn.

**The Woodburytype Co.**—Owing to the retirement of Mr. G. C. Whitfield, the senior partner in the Woodbury Permanent Photographic Co., Castle Bar, Ealing, negotiations have taken place which have resulted in Messrs. Eyre and Spottiswoode, Her Majesty's Printers, acquiring the whole of this business. Messrs. Eyre and Spottiswoode announce that they will continue to carry on the business under the same designation and with the same management as hitherto, and that with the improved machinery and all modern appliances, they will be prepared to give estimates and carry out all work entrusted to them.

**Naming Photographs.**—The question of "How to name or title photographs" is constantly being discussed. In a recent issue we referred to the "Nameit," which has been introduced by Mr. A. Gray, of 44, Snow Hill, London, E.C. That gentleman has now sent us a box fitted up complete with fount of indiarubber-faced type, holders, printing medium, films, etc. (See illustration.) The method of procedure is as follows:—

(1) Set the type up in the holder; to do this, begin at the end opposite the screw, placing the types in the holder upside down, or with the nick in the metal away from you; when all the types are in the holder see that they are well down and even before fixing the screw. (2) Put as much Filmite on the pad as the brush will hold—too much will blur the letters—try an impression on a piece of paper to see that there is no mistake. (3) Place the medium on a

sheet of blotting paper, holding it down flat with a piece of card (post card will do, as it will also answer as a guide to print the name straight), then press the type on the film, not too heavily, and holding it for a second or two to allow the film to absorb the Filmite, then remove the type gently. Allow the impression to stand a few seconds, then lightly dust the impression well over with the bronze powder, using for the purpose a piece of cotton wool or wadding; before dusting off, a piece of clean paper should be placed over the impression and the bronze pressed in by drawing the fingers along the back of the paper. The bronze can then be dusted off either with a clean piece of cotton wool or camel hair brush. (4) To fix the film, place the film with the bronzed side of the negative with name in position in which it is required to print, then touch either end with a little acetic acid (a splint of wood or end of a match will do), allow to dry, when it will be found that the film is securely fixed at either end. The acid will in no way injure the negative. When dry, the printing may be proceeded with. The whole apparatus is well made, and will be found of much use to amateurs.

## Quarterly Examinations in Photography.

**Question 13**—*Why are alkaline salts added to a toning bath, and explain the action of a toning bath?*

**ANSWER.**—Gold as used is auric chloride (or trichloride of gold, i.e., one atom of gold combined with three of chlorine),  $\text{AuCl}_3$ , and as chlorine has a greater chemical affinity for silver, the latter when present unites with the chlorine, and the gold is reduced to a metallic form; but according to the law of chemical combination (silver and chlorine combining equally) each atom of chlorine requires one of silver, hence for each atom of gold deposited three atoms of silver are used, and consequently there is a great loss of tone. To overcome this, the alkaline salt is used, which combining with two of the atoms of chlorine leaves the gold in the form of aurous chloride,  $\text{AuCl}$ , to exchange with the silver, but this time atom for atom, hence with little loss of tone.

The alkaline salt, therefore, is really added to alter the form of the gold salt so as to enable it to exchange with the silver with the least possible loss of tone, and it further neutralizes the free acid in the gold solution which is there as a preservative. The aurous chloride is very unstable, and the alkali if left with the gold unites with it, forming some double salt which is the deposit in an old bath.

S. N.

**Question 14.**—*Is it preferable to use a swing back or moveable front to a camera? State reasons for answer.*

**ANSWER.**—The moveable front as far as it will go. It is far easier to get the whole plate in focus when raising a lens than to do so when the back is swung to any serious extent. When I have been forced to tilt the camera to any very great extent, I have preferred not to swing my back, but to make a transparency from the resulting negative in the camera. It is easy with care to get an image perfectly free from distortion, by swinging the negative or back or both so that the effect of the original defect from the perpendicular is exactly done away with.

R. C. M.

**Question 15.**—*What are the chief causes of fading in prints?*

The chief causes of fading in prints are:—

- (1) Imperfect fixing. If any of the silver salt is left behind, it is sure to cause the prints to fade.
- (2) Imperfect elimination of the hypo. Any hyposulphite of sodium or of silver is very injurious to the print.
- (3) Too prolonged washing. Prints are much more likely to fade which lie in water twenty-four hours than those which are washed quickly.
- (4) By the use of a bad or acid mountant.
- (5) Mounting the prints on impure mounts, which contain injurious salts used in their manufacture.

There are said to be several other causes of fading, but these are the chief.

YXOL.

## ALLEGED PHOTOGRAPHIC NUISANCE.

LAST WEEK Mr. Justice Romer, sitting in the Chancery Division of the High Court of Justice, had before him the case of *Turner v. Elliott*. This was an action by Mr. Turner and others against Mr. Elliott, member of the firm of Elliott and Fry, to restrain an alleged nuisance caused by smell arising from the defendants' printing and dry plate factory at Barnet.

The smell complained of was stated to be caused partly by the storing of sensitised albumenised paper and partly by the use of liver of sulphur. Professor Tidy and Dr. Dewar, who were called on behalf of the defendants, gave it as their opinion that no possible nuisance could be caused to residents in the neighbourhood by the use of these materials.

Mr. Neville, Q.C., who appeared for the defendants, asked his lordship to disregard altogether the theory that any smell could arise from the gelatine used in the manufacture of dry plates, as it had been clearly shown that the least trace of impurity in this substance was absolutely fatal to the defendants' business and it was consequently to his own advantage that it should never be allowed to decompose. Mr. Justice Romer here interposed, and said that the case was one of extreme difficulty for a judge to decide, and that he thought that an independent witness should be sent down, who should make a report to him (the judge); this would save both parties great expense. He would reserve judgment till after he had heard the report.

Mr. Haldane, Q.C., for the plaintiff, agreed to this proposal, on condition that the defendant gave an undertaking to in no way change the processes employed meanwhile.

Mr. Neville gave the undertaking, and the case was adjourned till after the Whitsuntide recess.

## Societies' Meetings.

**Ashton-under-Lyne.**—On the 7th inst. the President, Dr. A. Hamilton, had on view at the Society's rooms a large collection of stereoscopic transparencies taken by himself during visits to the Continent, which were thoroughly enjoyed by a large number of members present. Dr. Hamilton was the winner of the last AMATEUR PHOTOGRAPHER Stereo Competition. The first ramble of the season took place on Saturday afternoon, but, owing to the inclemency of the weather, only fifteen members availed themselves of the out. The afternoon, however, turned out a success from a photographic point, and a very pleasant and enjoyable time was spent, upwards of seventy plates being exposed.

**Belfast Y.M.C.A.**—The annual meeting of the above Club was held on the 6th inst. There was a large attendance of members. The President, Dr. Coates, took the chair. The Secretary read the report for the past year, also the financial statement. The report was very satisfactory, and showed great progress during the year. The summer rambles were very well patronised, and very enjoyable they were. The new programme should prove attractive, as it embraces some of the most interesting photographic districts convenient to town. The winter meetings were more successful than ever before; the membership is still increasing. The Club now possesses two optical lanterns and a first-rate enlarging apparatus, which have been in constant use of members. The Treasurer was able to show a balance on hand, although the year had been one of exceptional expense. The following office-bearers were elected: President, Stanley B. Coates, M.D.; Vice-Presidents, William Swanston, F.G.S., and B. D. Wise, C.E.; Secretaries, James H. Hamilton, 3, Eden Terrace, Shankhill Road, James McCleery, 63, Royal Avenue; Treasurer, James H. Hamilton; Committee, William Strain, Robert McCann, Hamilton McCleery, John E. Pim, T. F. Bell, J. S. M. Best.

**Bournemouth.**—A meeting of the Photographic Section of the Bournemouth Society of Natural Science was held on Wednesday, the 6th inst., when four short papers were read, the first by Mr. Greenleaves on "Outdoor Group-taking." The errors to be avoided, as well as the objects to be aimed at, in a good group photograph were explained and illustrated by specimens. The second paper was by Mr. Piercy, on "Self-toning Paper;" about half-a-dozen prints on this paper were shown, all treated in a different way, with a view of finding the range of tone that could be obtained on it. The third paper was by Mr. Wm. Jones, on "Alpha Paper;" about a dozen prints on this paper were shown, illustrating the results obtained by different exposures and various methods of toning. The last was by Mr. Price, on "Stops;" various ways were mentioned of ascertaining the focal length of any lens, and how to value and mark its various stops. The question of large *versus* small stops was also dealt with. An interesting discussion followed the reading of the papers. It was announced that an exhibition of photographs would be held at the end of the month. Dr. Greves, President of the section, occupied the chair.

**Brechin.**—The last ordinary monthly meeting for the Session was held on the 5th inst. In the absence of the President, Mr. Wm. Stewart, jun., was called to the chair. Messrs. Stewart, Brown, Dakers, and Ross were appointed a Committee to revise the constitution and bring up recommendations to the annual meeting in September. It was intimated that the Committee had arranged to allow visitors to have the use of the reading-room and dark-room at the nominal charge of 1s. per month. The Secretary, Mr. J. D. Ross, read a short paper on "Stereoscopic Photography with a Quarter-plate Camera." Although not advocating the use of such a camera for the best stereoscopic work, he pointed out that a stereoscopic camera is not essential to the production of stereoscopic slides, and in proof exhibited a number of transparencies and other slides taken with a small camera without extra top for stand or any extra apparatus. Messrs. Stewart and Mackie spoke on the beauties of the stereoscope, and the passing of several votes of thanks brought the meeting and Session to a close.

**Brixton and Clapham.**—At an ordinary meeting held on the 17th inst., Mr. T. J. Bartrop, one of the members, gave a most interesting lecture entitled "A Tour in the Ardennes," illustrated by some eighty or ninety lantern slides taken with a hand-camera by the lecturer and his party on a trip last August. The lecture throughout was thoroughly appreciated by the members, and a hearty vote of thanks was accorded the lecturer for his enjoyable entertainment. On the 9th inst. the first outing of the season took place. The district chosen was Perivale, but the dulness of the day and the poorness of the scenery somewhat damped the ardour of those who took part. Some good views, however, were obtained of the church and rectory. The best position for this is from the meadow opposite, but for the benefit of other photographers it should be mentioned that the owner of this meadow threatened some of the party with prosecution for trespass. There are also a few pictures to be had along the canal. The next meeting will be held on the 21st inst., when a lecture will be given on "Hand Camera Work" by Mr. W. H. Powell.

**Croydon.**—The third half-day excursion was held on the 9th

inst., a party of members, conducted by the President, journeying to Merstham. In consequence of the dull light and gloomy mist prevailing, the attendance was less than would otherwise have been the case. The atmospheric conditions were found to be so unfavourable for photographic work that on arriving at the rendezvous, "The Feathers," the apparatus was left there, and members resolved themselves into a committee of inspection, a most enjoyable ramble being the result and several scenes noted for future use. Amongst other places visited was the interior of Gatton Church, with its wealth of carved wood of Flemish origin; the party also, by special permission of Mr. Coleman, inspected the far-famed marble hall, with its interesting objects of art. The gardens and terraces of Gatton House were also duly admired, and the more picturesque portions of the home-park explored. Had the weather only been propitious, several artistic and attractive negatives would have, without doubt, been attainable. Returning to the "Feathers," at Merstham, about six o'clock, a bountiful high-tea was enjoyed. Subsequently the Treasurer and President captained two teams for a set to at bowls, which afforded much unrehearsed fun. In spite of the dismal weather, all were delighted with the outing. At the same time it is to be hoped that Saturday afternoons will in the future, for the benefit of the amateur of photography, yield a more liberal amount of light and shade. The next excursion is to Mitcham, in charge of Mr. Blow, and leaves West Croydon on 16th at 2.30.

**Holborn.**—Mr. Frederick Brocas, Vice-President, presided at the usual weekly meeting of the above club held on the 8th inst. Mr. Arthur Lawton was elected a member of the club. Two representatives of the Autotype Company attended and gave a practical demonstration on the autotype or carbon process. After giving an outline of the method of preparing the tissue, the demonstrator went on to speak of the printing, which he characterised as the only obstacle to overcome in the carbon process. The development of the picture was to a great extent under control, but it was quite as well to have a properly exposed print. For this purpose he showed three actinometers, one, the simplest, acting by colouring a piece of silver paper to a standard tint. The other two were on a different principle, one having a numbered scale, and the other a scale of tiny negatives of varying densities. He then mounted some exposed prints, and developed them by placing in hot water and washing away the soluble gelatine in which the picture was buried. Development was then stopped by placing the print in cold water, and, after placing in a five per cent. solution of alum to thoroughly discharge the bichromate salt, it is thoroughly washed and hung up to dry. For negatives made in the ordinary manner, an additional operation becomes necessary; for if the printed tissue were laid down at once on its final resting place, the picture would be inverted. To remedy this, the exposed tissue is laid down on a temporary support, such as a thick paper with a hard, highly polished surface, from which it is finally transferred on to its intended support, such as an opal. The process is an extremely simple one, and recommends itself to all amateurs. Twenty members attended the club outing to Pinner on Saturday. Leaving Pinner, they walked to Ruislip, through Eastcot, passing an old inn with the curious sign "The Case is Altered." The walk was a very pretty one, and in fine weather would be a paradise to amateurs or the plate-makers. Last Saturday was rather dull, but a very enjoyable day was spent, some eighty plates being exposed, finishing up with an excellent tea at the "Swan" Inn, Ruislip.

**Ireland.**—The last meeting of this session was held on the 8th inst., Mr. Geo. Mansfield, J.F., President, in the chair. The medals, presented for the Society's annual competitions were awarded to Mr. John White in the four following classes, viz., historical pictures lantern slides, detective work, and the best set of pictures taken on excursions of the Society. Mr. Alfred Werner then read a carefully compiled paper on "Platinum Printing," and went exhaustively into the history of platinum, treating of its discovery in the Urals, and mentioned that traces of the metal had been met with recently in the streams in the county Wicklow. He then treated of its conversion to the use of photographic printing, and traced the various researches made by different workers down to the present day. In the course of his remarks, Mr. Werner exhibited a print that, in contact with the atmosphere, had developed entirely out while in the printing frame, needing no further treatment to complete it, and stated that it had been a day and a half printing. The lecturer subsequently developed a large number of platinotypes by both hot and cold baths and with a great variety of developers, and drew the attention of his hearers to a method he had worked out for converting an untuned silver print into a pure platinum print, it being floated on a bath composed of potassium chloroplatinate soluble oxalate and a certain amount of citric acid; this converted the picture into a rich black and white print but Mr. Werner said that the difficulty he had not got over yet was a suitable fixing agent.

**Lewisham.**—At the meeting on the 9th inst., Mr. A. H. Miles, Vice-President, in the chair, a short paper was read by Mr. H. M. C. Sprunt, Assistant Hon. Sec., on "Cycling and Photography." He advised members to invest in a diamond frame safety with ball head

and cushion tyres, and a quarter-plate or a 5 by 4 camera, in preference to the tricycle and larger apparatus; hand-cameras were of very little use to the cyclist. To carry the apparatus, he used two cases, one for the camera, which was strapped to frame in front of seat pillar, the other, carrying slides and lens, was slung from the shoulders, as if fixed to machine it was certain to cause pinholes. Next meeting, May 22nd, Mr. H. L. Davis will give a paper on "Flashlight Photography," when he will show a new apparatus he has just invented.

**Liverpool.**—The third ordinary meeting of the amateur photographic association was held on the 30th ult. There was a very large attendance. After several new members had been elected, Mr. Friese Greene's hand-camera was exhibited. Mr. J. A. Furnivel, of Manchester, afterwards read a paper entitled "The Optical Lantern, and what can be Done with it," giving several illustrations, which were warmly applauded.

**Liverpool Y.M.C.A.**—The monthly meeting was held on the 6th inst. Messrs. Schierwater and Ellis demonstrated with platinotype paper. Mr. Schierwater gave a detailed description of the process, then both gentlemen developed several prints with excellent results. Several of the younger members were surprised at the simplicity of the process, being under the impression that platinotype was a difficult process to work. The Secretary (Mr. J. C. Lee) exhibited a hand-camera he was making. Mr. A. Evans showed some excellent pictures on Kallitype and ordinary sensitised paper, taken on the members' visit to Colwyn Bay at Easter. Arrangements were made to hold the first field day of the season on Saturday, 9th inst., at Ince Woods and Thornton.

**Lowestoft.**—The latest addition to the many societies which flourish in Lowestoft is the creation of the Lowestoft and District Photographic Society, which has for its President, Mr. F. Mayhew, Chairman, Mr. Stringfield; Secretary, Mr. J. W. Roberts; and Treasurer, Miss A. L. Stringfield. There is a fairly strong list of members, and it is hoped that arrangements can be made with the Committee of the School of Art by which a technical class can be formed in connection with that institution.

**Morley and District.**—The usual monthly meeting was held on the 5th inst., the President (Mr. S. Atkinson) in the chair. The formal business being disposed of, the evening was spent in friendly criticism of work. Messrs. Atkinson, Tomlinson, Smith, Scott, and the Hon. Secretary contributed a good number of negatives and prints, and Mr. J. Sanderson showed some admirable enlargements on Fry's bromide paper. Samples of Otto Scholz's matt-surface papers were handed round, and a specimen print, printed through green glass, the colour of which was admired by all.

**North London.**—A meeting was held on the 21st ult., Mr. Oakley in the chair. This being a lantern night, a number of pictures were exhibited upon the screen by Mr. Grover, Mr. Hudson, and the Secretary, after which slides belonging to Messrs. Mawson and Swan were exhibited. Another meeting was held on the 5th inst., Mr. J. Traill Taylor, President, in the chair, when Mr. Howson and Mr. Agnew attended, and gave a demonstration on the making of "Lantern Slides." On the 19th inst. Mr. Newman will lecture on "High-speed Shutters."

**North Middlesex.**—Notwithstanding the cloudy weather, a fair number of members attended the field day arranged for Saturday, May 9th, to Highgate and district, satisfactory work being done. On Monday, May 11th, Mr. G. W. Marchant in the chair, a most interesting demonstration on the working of platinotype paper was given by a member. Prints from the frames were passed round for inspection, showing the depth of printing necessary, and were then developed. The bath was kept at about 75 degrees and in some instances, where the shadows were a trifle heavy, the dark portions were withdrawn from the developer, while the lighter portions were allowed to gather strength. Numerous questions were asked and answered. On Monday, May 25th, a demonstration on the working of Kallitype paper will be given by Mr. F. W. Cox, when visitors will be welcome.

**Richmond.**—At a special general meeting on the 8th inst., Mr. Cembrano in the chair, it was resolved that the Society should be called "The Richmond Camera Club," and the alterations in the rules consequent on the change were made. At the ordinary meeting which followed, the subject for discussion was "Fixing and Washing Gelatine Negatives." The Chairman opened the subject, and recommended the use of two separate fixing-baths in the case of valuable negatives. Mr. Ardaseer explained the chemical changes in fixing, and insisted on the importance of leaving the plate in the fixing bath a sufficient time for the insoluble bromide that was left in the film to be converted in the soluble form which could be washed out. Several other members took part in the discussion.

**Sydenham.**—There was a well attended meeting of this Club on the 5th inst, it being a members' lantern night. About one hundred and fifty slides were shown and were appreciated, especially some lent by the Secretary of the People's Palace Photographic Club. The President was in the chair.

## The Amateur Photographer's Tourist Index.

Back Numbers, Post Free, 3d.

THE "Tourist Index" gives references to back numbers of the AMATEUR PHOTOGRAPHER which contain Articles on "Holiday Resorts and Photographic Haunts," and in addition many other items of interest to the "Tourist Photographer" given in "Answers" or "Letters."

The Editor will be glad if ladies and gentlemen will kindly contribute short articles upon any places of photographic interest which may not be included in the following "Index"—

*Note.*—Most if not all of the above numbers of the AMATEUR PHOTOGRAPHER can be supplied. For every copy required, three penny stamps must be sent to Messrs. Hazell, Watson, and Viney, Ltd., 1, Creed Lane, London, E.C.

## Quarterly Examinations in Photography.

### QUESTIONS.

- Describe Warnerke's sensitometer, and state your opinion as to its reliability.
- What is an actinometer, and can the results of such an instrument be relied on?
- Give a table showing the relative photographic activity of the following lights: Sunlight, lime, electric, magnesium (ribbon and flash), gas, and petroleum.

(Latest Day for Answers—May 25th.)

#### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
- All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
- A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.
- Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.
- Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

*NOTE.*—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor. Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"

AMATEUR PHOTOGRAPHER,

1, CREED LANE,

LONDON, E.C.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

#### RULES.

- Write clearly and distinctly on one side of the paper only.
- Write each Query or Answer on a separate sheet of paper.
- Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
- All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
- The Editor does not undertake to answer questions by post.
- In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4679. **Elko and Hydro.**—Wanted, a formula for above; elko to be in 5 per cent. solution in water or methylated spirits, hydro to be in 5 per cent. solution in methylated spirits, using either carb. soda and potash mixed in 5 per cent. solution, or hydrate soda same strength. Give quantity of each for half-plate landscape work. Have found I cannot get any density with elko alone.—**VERDANT GREEN.**

4680. **Westminster Abbey.**—Am intending to photograph in Westminster Abbey, in the chapels. I use Edwards's plates. Should they be rapid, or the slow landscape plates, and with a small stop? What sort of exposure is required? I use a whole-plate camera and a Ross wide-angle lens. Any hints gratefully accepted.—**A. M. C.**

4681. **Snap-Shot Developer.**—Would Mr. F. Young kindly explain the snap-shot developer sent to the AMATEUR PHOTOGRAPHER of last week, as to the weight of grams into grains or drachms, and B solution of saturated soda, as to weight and quantities of water, and how to be used as a developer?—**NOVIS.**

4682. **Scilly Islands.**—Any information as to this part as a holiday resort would oblige, as to facilities for photographing boating, also some idea of comfortable hotels.—**T. FORB.**

4683. **The Dukeries.**—Will any one kindly give me a few hints as to spending a few days in this district, where to stay and what to see and photograph?—**DUPLEX.**

4684. **Septa Tones.**—What materials and what process are best for producing these with certainty on rough paper? I have tried Alpha rough, but cannot make sure of the tint and also it is not rough enough.—**DUPLEX.**

4685. **Llandrindod.**—For some information about Llandrindod and its neighbourhood as a photographic field, apartments, and hints in general I should feel grateful. I would also ask for like information about Trefriw, near Llanrwst, North Wales.—**NOSRAP.**

4686. **Cutting Paper.**—I should be glad if any one of your readers could inform me the best way to cut ten or eleven pieces of double albumenised sensitised paper size half-plate (6½ by 4½), out of a sheet of the same kind of paper measuring 17½ by 22½ in. without including in the name of the manufacturers and their trade mark, which is stamped on the edges round every sheet of paper and occupies a space of nearly ¼ of an inch wide very nearly all round every sheet of paper, put there as a kind of an advertisement by the manufacturers, which does the paper no good whatever. I have found it most inconvenient both in cutting the paper and printing on the paper from a negative ever since I have used it, and I dare say that I am not the only amateur photographer who has found it the same, as it generally happens for me and many others that the trade mark, etc., round one or two edges of each piece of paper which is cut from the edge of each sheet of paper comes either in the sky or some light foreground and completely spoils the print, and when trimming I have to cut off nearly ¼ of an inch so as to avoid this trade mark business, which makes the print measure 5½ by 4½ instead of 6½ by 4½, the proper size when trimmed and mounted.—**W. H. ELLIS.**

4687. **Reliable Half Plate Camera.**—Could any reader of the AMATEUR PHOTOGRAPHER give me the

name of a reliable half-plate camera, stating price.—**K. M. W.**

4688. **Instantaneous Shutter.**—Can any reader give me maker and price of instantaneous shutter which has dial indicating exposure in fractions of second for quarter-plate camera?—**INSTANS.**

4689. **Toning Aristotype.**—Will some one kindly give me a formula for toning aristotype or chloride of silver prints?—**FAILURE.**

## QUERIES UNANSWERED.

April 24.—No. 4638.

May 1.—Nos. 4647, 4648, 4653, 4654, 4655, 4657, 4658, 4659.

" 8.—Nos. 4665, 4668, 4671, 4674, 4675.

## ANSWERS.

4651. **Warwick and District.**—Buy a sixpenny guide-book. Stay at Leamington, which is most central for Warwick, Stratford-on-Avon, Kenilworth, and Coventry. Do not miss Guy's Cliff.—**STILLING-FLEETE.**

4661. **Gold.**—The gold you mention is sufficiently pure. See "Dictionary of Photography," page 83.—**H. LEACH.**

4661. **Gold.**—Put a half sovereign into a small evaporating dish in a hot-water bath, and pour on it ½ dr. of nitric acid, to which has been added 2½ drms. of hydrochloric acid and 3 drms. of water. After a few hours, during which the bath is kept at a gentle heat (mind the fumes of chloride, which are very suffocating), most of the coin will be dissolved. If any is left, repeat the dose of aqua regia made as at first, and again the third time, if necessary, after a few hours more. If any silver should be present in the coin, there will be a deposit of chloride, which will not dissolve, so don't let this deceive you. Dilute the solution, when complete, with distilled water, and add aqueous solution of sulphate of iron, 6 parts to 1 part of gold. The gold will be precipitated in the form of a black powder. Collect this, and dissolve it in aqua regia as at first. This is then pure solution of chloride of gold, free from copper. It should be evaporated to dryness, and then re-dissolved in water, one grain to a drachm of water. Half a sovereign weighs about 61 gr., of which 56 are pure gold, so there will be about 86 gr. of chloride of gold to dissolve.—**ANON.**

4661. **Gold.**—Take a half sovereign, and put it into a glass bottle that will stand heat, and place the bottle in a basin half full of sand; then mix in a glass measure 1 dr. nitric and 5 dr. hydrochloric acid, and add about 3 dr. of this to the gold in the bottle. Place the whole on the hob by the fire for about an hour, giving the bottle a little shake now and then, when most of it will be dissolved. Now pour off the clear liquid into a 15 oz. bottle, then add some more of the acids to dissolve the rest of the gold, then pour the whole into the large bottle. It must now be neutralised by adding a few small lumps of whiting, and then test with litmus paper. Fill up the 15 oz. bottle with water. You now have gold chloride consisting of 8 gr. to the ounce, and as much as is in eight 15 gr. tubes, and, if bought at a chemist's, would cost about 16s. The above is about the simplest way of making gold chloride, but, altogether, I think it is a very risky process, as it is no joke to lose a half sovereign, if by chance you go wrong. I should advise "J. W. W." to buy a 15 gr. tube, and put it into a 2 oz. bottle, and make up to 15 dr. with water, and use 1 dr. for one sheet of paper. This is what I do.—**P. R. S.**

4662. **Developer for Hand-Camera Work.**—See page 337 last week.—**H. LEACH.**

4662. **Developer for Hand-Camera Work.**—You cannot do better than use the formula recommended by Mr. Paul Lange, which is as follows:—

Washing soda ... .. 2 oz.  
Bromide of ammonium... .. 20 gr.  
Water ... .. 16 oz.

For use, take ½ oz. of above, and make up to 2 oz. with water, and add about 5 gr. of dry pyro. This will give you a very yellow negative, but the print will be all that can be desired. No acid bath required. If your image is slow in coming out, you can merely cover the plate up and leave it to act by itself.—**HINTS.**

4663. **Enlarging.**—Get the Optimus lantern, at 30s.—**H. LEACH.**

4664. **Focal Length.**—Instantograph lens, you mean. 8½ in.—**H. LEACH.**

4664. **Focal Length.**—If you mean the focal length of the lens, it is difficult to say offhand, but, generally, a half-plate lens is, or should be, about 8 in., or even more, but you can ascertain this for yourself by focussing something about 30 ft. away, and then measuring the distance from the diaphragm slot to the ground-glass screen, or, if only a single lens, from the lens to the focussing screen.—**HINTS.**

4666. **Plates, Preserving in Tropical Climates.**—Keep all your materials in as cool a place as possible, and in air-tight boxes.—**H. LEACH.**

4667. **Testing Shutters.**—Make a white mark on the wheel, then turn it round till it acquires a speed of one revolution per minute, and then expose. On

development, you will see what portion of a single revolution the white mark moved through during the exposure, when the speed of the shutter is reduced to a simple mathematical calculation. — H. LEACH.

4663. **Obernetter Paper.**—Either paper or glass is dirty. Is your glass thoroughly polished? — H. LEACH.

4669. **Obernetter Paper.**—Can sympathise with you over this. There is always an amount of uncertainty, in using a glass plate, as to whether there will be any sticking or not, but the writer has overcome this to a great degree by the use of an enameled plate, which can be obtained of any dealer, or a piece of ferrotype plate can be used, but before using that it is best to heat it well. — HINTS.

4669. **Obernetter Paper.**—In reply to "W.," if he will thoroughly clean his glass with hydrochloric acid or ammonia, rub the talc well in and wash under tap, in the meantime having passed paper through a saturated solution of alum and well washed, bring both together under water, squeeze, and set up to dry in warm place, he will not be troubled with prints adhering to glass again. I used to be fearfully bothered with your complaint till I dried the alum and hydro acid bath, and now they dry off as easy as can be. — X. Y. Z.

4669. **Obernetter Paper.**—Why try drying on glass, when better results can be obtained on ferrotype plates? Prints can then be dried in a few minutes in front of a fire and stripped without any trouble after first squeezing. If glass is preferred, there should be no trouble, after thoroughly cleaning and French chalking on the right side of the glass. Note that there is a right and wrong side to glass, which can be ascertained by rubbing the thumbnail across each side; the side presenting the greatest resistance is the wrong side. No amount of French chalking will induce a print to strip if put on the rough side of the glass. — KEYNSHAM.

4670. **Groups.**—A single lens is not suitable for this branch of portraiture. — H. LEACH.

4670. **Groups.**—Yes, you can use a single lens for both purposes; if you are considered the next best lenses to use when portrait lenses are not available. The distance and exposure is governed a great deal by the lens you use, as well as the size of the picture. You would do well to read Burton's book on photography, or one by Jerome Harrison. Gelatine plates are of varying rapidities, which naturally alters the time of exposing. If you find out the aperture of the lens you use and rapidity of the plate, by referring to Burton's book, you will find the time of exposure fully marked out for you. — HINTS.

4670. **Groups.**—With careful arranging, groups can be taken with a single lens in a garden, and also in a studio. The group should be placed in a slight semicircle, and don't have the features too near the edges, or they won't be clear. I have taken capital figure studies with a single lens, but I take good care not to have the figures too near the edges. Of course, a R.R. ought to be used, but a single lens is best for vignettes. It is impossible to give you the distances you ask for, as you do not give the focus of your lens, but the smaller you want your picture to be the farther your sitter must be from the camera. As to exposure, I should advise you to use  $f/13$  or  $f/20$ , and give about 4 sec. in diffused light, but be guided more by the light. You don't say what rapidity your plates are. I have given you the time for 30-times plates. — P. R. S.

4672. **Names on Negatives.**—See answer No. 4646 last week. — H. LEACH.

4672. **Names on Negatives.**—The best way to write names on negatives, so as to print white, is to lay the negative on a piece of paper film side up and write on the film with a very fine brush, using either red or chrome water colour, which can easily be wiped off if not liked. Of course, the title must be written backwards, so as to print the right way. — P. R. S.

4672. **Names on Negatives.**—This is very easy to do. Take a pen, or, preferably, a brush, and write on the negative, gelatine side, backwards, with some opaque liquid, such as red paint (using thick). Or, if this is troublesome, write it on the other side of the negative, the right way when you can easily trace it on the other side. Or another way is, if you possess a rubber stamp set, take an imprint of the writing you desire on the print, and, whilst wet, transfer it to the gelatine side of the negative. — HINTS.

4673. **Pyro Developer.**—You cannot do better than use the one given under 4662, or, if you desire one that will give clear negatives, use the following (Wratten's formula):—

Solution A.			
Sulphite soda	...	...	1½ oz.
Water	...	...	20 "
Sulphuric acid	...	...	15 minims.
Pyro	...	...	2 drms.
Solution B.			
Washing soda	...	...	1½ oz.
Water	...	...	20 "

To use, equal parts. — HINTS.

4673. **Pyro Developer.**—In reply to "H. S. B.," I should say that, first of all, he was over-exposing, and, secondly, that he was using too little pyro for landscapes. He might try two parts of No. 1 to one part of No. 2. I think, however, his formulae are

open to improvement. He will find a list of proportions for several of the plates in the market at the end of the "British Journal Almanac" for 1891, referred to the cune of developer. The following is, however, a useful proportion: 2 gr. pyro, 2 minims of ammonia, and ½ gr. of bromide of ammonia. He might make up the bromide and ammonia in a solution, and, at the time of development, add the pyro dry thereto. Or a better way is to make up 10 per cent. solutions of ammonia, bromide of ammonia (or bromide of potassium), and pyrogallol, and use them in proportions as required for the subject. Pyro, in this case, requires a preservative, and he might try a sample bottle, price, I think, 6d., from the Platinotype Co., Southampton Row, Holborn, London, and see how he likes it. This is made up with sulphite of soda. "H. S. B." had better buy a book on photography treating of development; there are many good ones, and full details would take up too much space. — J. G. P. VORREKER.

4676. **Negative for Process Work.**—Under-expose, and intensify with a strong intensifier. — H. LEACH.

4677. **Lens for Hand-Camera.**—If the hand-camera does not allow of any focussing, the lens would not be likely to suit. — H. LEACH.

4677. **Lens for Hand-Camera.**—You must bear in mind that the lens used must be of the length the camera is made for, or the plates will be out of focus. — HINTS.

4678. **Brass Work.**—Steam the brass work just before exposing. Use a light background. — H. LEACH.

4678. **Brass Work.**—Keep the subjects of your pictures away from the light as much as possible, and use a thickly-coated plate, and it would be as well to back it with a burnt sienna and gum backing, to prevent halation as much as possible. The best background to use is one that will show your subject up to the best advantage, that is to say, use a dark one for a light subject, and vice-versa. — HINTS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret. — ED: AM: PHOT:

PHILIP B. DURNFORD.—Thank you very much. ELSIE.—You should have sent prints from the half-plate negatives, and not reductions. They appear to be very fair work, and are good in composition. You must make your own selection as to which to enter in our Monthly Competition.

F. C. BARTON.—Dallmeyer's triplet lens consists of three achromatic meniscus combinations, the two outer ones being convergent, the middle one being divergent. When used for landscape or outdoor work the smaller of the combinations should be placed towards the object; when used for enlarging, the larger combination. The central and divergent combination may be removed and the two outer combinations used alone, in which case the focal length of the lens is halved and its rapidity, or  $f/z$  ratio aperture, obviously much increased, but the field is then so curved as to permit of but limited use. The ratio aperture of the complete lens is  $f/10$ . Monckhoven gives the following as the advantages of this lens: (1) With equality of focal length it covers sharply a focal plane much larger than the ordinary single objective. (2) It is, within practical limits, free from distortion, but not from astigmatism. (3) It is free along its axis from spherical aberration. (4) With a diaphragm the thirtieth of its focal length it covers sharply an extent of focal plane of which the greater side equals its focal length, and this aperture of the diaphragm is sufficient for giving brilliant images. If, from insufficiency of light or from any other cause, the diameter of the diaphragm has to be increased, the sharpness of the image does not decrease but only the extent of the surface sharply covered.

W. M. B.—(1) Your sitter should be about 3 feet from the background. (2) Six feet is ample for operator to work in; we have before now worked in half that distance without inconvenience. (3) The most suitable lens for your work would be Suter's portrait lens, No. 4 rapid series; this has a focal length of 8 ins. and an aperture of  $3\frac{1}{2}$  ins., or practically it works about  $f/2\frac{1}{2}$  and requires only 13 feet between sitter and lens for full-length cabinet. This is one of the finest and most rapid lenses yet made. Suter's No. 5 of same series is  $9\frac{1}{2}$  focal length and same aperture, but requires 15 feet between lens and sitter. Either would suit your purpose, but the former, No. 4, is, of course, more rapid. Gotz, of 19, Buckingham Street, Strand, is the English agent.

UNUS.—(1) Sulphuric acid diluted with 4 parts of water, or a solution of chloride of lime used with pumice stone powder. (2) Hubert's is the best book. (3) Burton's "Notes on Photographic Optics," price 1s., from our publishers, would probably suit you.

F. TURNER.—We are frightfully cramped for space

just now, but will try and let you have what you want soon.

F. PARTRIDGE.—We hope to give you an article in a week or so. Send us up a print which shows the fault you complain of.

F. W. REYNOLDS.—Probably your thin negatives are due to over-exposure, but this we can hardly say without seeing them. The exposures given in tables are applicable to both single and double lenses. You cannot avoid the consumption of the wick of the lantern; deficient air supply will cause rapid burning of wick.

J. DOUGLAS.—To find out the difference of exposure between a lens of 7 in. focus and one of 5 in. focus with same size stop, divide the foci by the aperture of stops, square the result, and the numbers thus obtained will give you the relative exposures. Example: You have a 7 by 5 in. focus lens and are using a stop with  $\frac{1}{2}$  in. aperture.

$$\frac{7}{\frac{1}{2}} = 14; 14 \times 14 = 196.$$

$$\frac{5}{\frac{1}{2}} = 10; 10 \times 10 = 100.$$

Therefore your exposures will be as 196 : 100, or practically as 2 : 1.

H. S. W.—We have examined the paper, and you might use it with safety for wrapping negatives in, but not for wrapping undeveloped plates.

A. B.—You would find a description of the iconometer in the "Dictionary of Photography," page 271, second edition, with diagram and measurements, and foci of lenses, from which any optician could make you one for about 5s. Write to Mr. Platt, Birkbeck Works, Dalston.

G. C. J.—The question is one which has been thrashed out before in our correspondence columns. If the solution of chloride of gold is neutral, then a small quantity of borax only is needed, whereas if it is acid, a larger quantity is required to neutralise the free acid and render the bath alkaline. There are three states of toning bath—acid, neutral, and alkaline—and much depends on which is chosen, when deciding the quantity of salt to be added.

F. M. Y.—The choice of the lens must depend upon the class of work that the hand-camera is required to do, and also the same rule must apply to the use of diaphragms and quick shutters. The combined elkonogen and hydroquinone developer is recommended for instantaneous hand-camera shots, for general work, and diluted for lantern slides. We have not found that it gives such clear glass as you lead us to believe for landscape work, if the plates are over-exposed or over-exposed. When under-exposed, it has, like all other developers, a tendency to clear glass, but as the colour of the deposited image is less non-actinic than with pyro, there is not such extreme hardness or contrast between the lights and shadows, and the results obtained are superior to the simple hydroquinone developer. If we can give you any assistance re hand-camera work, send us up some definite questions, when we may be able to give definite answers.

T. LIBLE.—Your toning bath should be at least twelve hours old before using, and the hypo made distinctly alkaline by the addition of ammonia or of carbonate of soda. Add  $\frac{1}{2}$  oz. of the latter salt to every pint of fixing bath. Your prints have been printed in the sun; never do this. Let us hear from you again.

J. R. W.—Almost every month sees some new hand-camera placed upon the market, and, consequently, there are plenty which can almost be had for the asking. Still, it would do no harm to offer yours to some maker. Will write you later on.

SHADOW.—First we will find all the faults in your portrait, then help you by some hints. Your sitter is too near the background, and the texture of the blanket shows too plainly. The sitter was opposite the window, by no means the best position. The lens is of too short a focus for such a large head, which is about 2½ in.; this means a reduction in size of one-fourth. The focus of the lens would therefore be lengthened to 9½ in.;  $f/16$  would therefore become  $f/20$ , which would account for the long exposure. Place your sitter more on a slant with the window, and use a sheet as a reflector for the shadow side of face. You will find, in our recent notes on home portraiture, full directions on this point; but if you will send us a rough plan of your room and a stamped addressed envelope, we will mark the most suitable positions for sitter and camera.

PYRO.—No. 1 negative shows signs of movement, and is over-exposed. About half a second would have been plenty; the plate is also fogged in developing. No. 2 is also over-exposed and fogged in developing; even less than half a second would have sufficed for this. Try again, and send us some more negatives. Two grains of pyro is plenty for a quarter-plate.

G. K. T.—We do not agree with you as to the position of the intercepting diaphragm. As you use it, it practically becomes a diaphragm, and unnecessarily slows the lens.

S. C. BRIGHT (Genoa).—We are always pleased to help any of our readers, and we do not mind the length of their letters. No. 1: The negative is well exposed and well developed, the gradation of light and shade good. We should have preferred to cut off an inch of the foreground, and waited to get a country cart or group of native women in the road, instead of the solitary individual. The warm tone is pleasing and suitable. No. 2 is not quite so happy,

but it is a very trying subject. In this we should just take off half an inch of foreground, and put the camera rather more to one side of the road, and put the figures nearer the camera. No. 3: Too small a stop was used, and a little longer exposure would have given you more detail, both in the foreground and left of bridge. The house is a little too sharply focussed, consequently the bridge does not stand out quite enough. We accept the prints with many thanks, and note your kind offer of dark-room. Send us on as many prints for criticism as you like, only would it not save your postage not to mount them?

**ALPERUM.**—We are much obliged for your kindness in sending the two exposed plates. We will return you the box and the plates developed at the same time. We shall be glad to have the bromide prints; you will see when the time arrives. Glad to hear you like the AMATEUR PHOTOGRAPHER and its Annual.

**F. J. H.**—We shall have some articles shortly on this subject. But the plate should be back all over before fixing. Each developer gives a peculiar character to the negative. Judging from the negative, your lens does not cover sharply to the corners of the plate, otherwise it would make a very fair print on chloride emulsion paper.

**O. D.**—Baker's parallel trimmer is sold by Mr. W. R. Baker, of Wallington, Surrey. The prints should be mounted in light albums.

**T. G. VIVIAN.**—Another year we will consider your kind suggestions.

**A. W. COOK.**—About "too much density" write to the Britannia Works Company; they can answer the question much better than we can. We will give a formula for uranium toning bath next week.

**H. LEACH.**—The "Quarterly Examinations" will certainly be continued. Many thanks for your assistance in the Query and Answer columns.

**W. H. BARRETT.**—Eikonogen; use Paget's xxxxx.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.**

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

**Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.**

**Burnishers.**—Lancaster's half-plate burnisher, perfect order; cost 21s.; price 15s. — H. Kinnaird, 171, Caledonian Road, London.

**Tourists' half-plate double extension camera and two backs, excellent order, Gem time shutter, photometer; £3 10s. lot, or separate.**—Lewis, 43, The Grove, Vauxhall.

**Half-plate Lancaster's extra-special long-focus camera and three double backs; cost £5 10s.; will accept £4; good as new.** — Pain, Kingswood, East Sheen.

**Birmingham.** Whole-plate Ashford's best camera and four slides.—Thorpe, Congreve Street. £7 7s. half-plate camera for sale, splendid condi-

tion, three double dark slides, etc.; what offers?—A. Wolfe, Abbotsholme Rochester, Stafford.

**Cameras, Lenses, etc.**—For sale, the property of a private gentleman, all in good condition; offers requested; may be seen at Stanley's, 13, Railway Approach, London Bridge, S.E.: Whole-plate bellows camera, one single and three double backs, Dallmeyer lens 3D, 7½ by 4½ bellows camera, with one single and six double backs, one light sliding tripod stand, two plate boxes, 7½ by 4½, and six light-tight ditto, three 5 by 4 plate boxes and two light-tight ditto, one 3½ in. lantern condenser, also a quantity of dry plates and good apparatus for electrical experiments.

5 by 4 camera, leather bellows, dark-slide, with two inner frames, new, fitted portrait lens (by Lerebours), rack and pinion, covers half-plate, complete; 35s.—W. C., 13, Cobden Street, Everton Road, Liverpool.

5 by 4 bellows camera (by Cox), three double backs and one single, also 5 by 4 portrait lens, thorough good instrument; the lot 50s.—Pyro, 17, Storey Road, Walthamstow, Essex.

**Quarter-plate Rayment camera, three dark-slides, and Optimus 5½ in. focus Euryscope lens, with Iris diaphragm, all in splendid condition, and fitted up in best leather-covered box for use as hand-camera, or can be used on tripod; Mr. Paul Lange's fine pictures of Norway and Iceland were taken with a similar apparatus.** — Address, F. Bell, Hahnemann Hospital, Hope Street, Liverpool.

**Half-plate Thornton-Pickard new Ruby camera, three double dark-slides, Thornton-Pickard time and instantaneous shutter fitted to front, turntable top, 3-fold tripod for same, list £8 8s., will accept six guineas, warranted; Ideal detective camera, quarter-plate, with Taylor and Hobson's lens, Iris diaphragm, cost about ten guineas, price six guineas, almost new.—3, Montford Place, Kennington Green.**

**Watson's half-plate B camera, complete with £4 Iris lens, case, stand, accessories, quite new; cost £14; what offers?** — Apply, T. R., 1, Hampstead Lane, Highgate, N.

**Whole-plate Lancaster's Instantograph, one wood, three metal double slides, lens, shutter, tripod, leather bag; cost £8; lowest price, £5.**—Address, F. J., care of Mr. Crowther, Dukinfield.

**Whole-plate light Kinnear camera, all movements, three double slides, R.R. lens (by Wray), 11 in. focus, new combination lens (by Beck), 7 in. focus, ash tripod, leather-bound and canvas cases, printing sundries, etc.; £15.** No. 158, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Baroness camera, quarter-plate, most fairy-like instrument, every possible movement, new last autumn, perfect condition, fitted with Eastman's roll-holder, quite new, Beck's rapid rectilinear lens, Iris diaphragm, 4-fold stand and solid leather case; price £9 10s.; cost £13 10s.** — W. Thomson, Laurel Bank, Halifax.

**10 by 8 long focus conical camera, with all movements, three double slides in cases, whole-plate rectilinear lens and stops, two 10 by 8 Eastman's film-carriers, two sets of carriers for whole and half plates, very little used; lot for £8, as owner has just got a 15 by 12.**—Arthur F. Smith, 10, Watling Street, City.

**Hare's 5 by 4 new long-extension camera, reversible holder, three double slides, Eastman roll-holder, tripod stand, focussing cloth, view-finder, solid leather case, cost over £13, price £10; Dallmeyer's 5 by 4 rapid rectilinear and Thornton-Pickard shutter, cost £5 8s. 6d., price £4 10s.** All the above are absolutely new, bought last month, and sold on account of owner purchasing larger set; approval.—Apply to Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C.

**Hand-Cameras, etc.**—Rough's Eureka quarter-plate, green leather covered, 5 by 4 lens (Kouch), working f/3, two finders, mill screw to shutter, instead of separate key, whole intact; price £5 5s.; would cost £8 8s. new.—Solicitor, 33, Walbrook.

**Kodak for sale, cost £5 5s., about 40 unused films; price £3.**—Dr. Hodges, Park Road, Gloucester.

**Wray's splendid Wellington hand-camera, 5 by 4 lens, Wray's rapid rectilinear, Iris diaphragm, shutter front of plate, finders, focussing screen, six double backs; cost 12 guineas; sell 6.** — No. 158, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Quarter-plate Magazine hand-camera, Perken, Son, and Rayment's Euryscope lens, cost 8 guineas, nearly new; £6, case included.** — On view at the AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Rough's Eureka detective camera, lantern size, in leather case, almost new; cost £6 10s.; price £4.** Can be seen at the AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Underwood's City hand-camera, carries 12 quarter-plates, as new; 20s.; cheap.**—Dorset Villa, Yeovil.

**Quarter-plate hand-camera, as new, Hethion Lewis pattern (by Turnbull), suits lens of 5 by 9 in. focus, six double backs, cost £8 5s.; with Taylor's Iris diaphragm lens, five guineas; camera alone £2 10s.; lens alone, three guineas; approval; deposit.**—S. E., 2, Wellington Terrace, Weston-super-Mare.

5 by 4 mahogany hand-camera, with one dozen 5 by 4 carriers and one dozen quarters, carries ten

plates, Lancaster's lens, shutter, and finder, plated fittings; take 40s.; a bargain; photograph sent.—Frederick Sharpe, Oakham.

**Hand-camera, first-class, six double dark-slides, lens, finder, and roller-blind shutter, in thorough working order; price 50s.** — T. Mercer, 16, King Street, Sparkbrook, Birmingham.

**Kodak, No. 4 Junior, quite new, takes pictures 5 by 4; cost £10 7s. 6d.; price £9, or exchange.** Wanted, 12 by 10 camera and three double slides.—F. W., Woodland Place, Haling Place, London, W.

**For sale, No. 2 Kodak, good as new, fully charged; £5.**—Perry, Stratton, Corwall.

**Lantern.**—Lantern, nearly new, good lenses, suitable for photographic slides, 3-wick paraffin lamp; price 28s.—T. G. Hyde, 97, Jerningham Road, New Cross.

**Lenses, etc.**—9 by 7 Optimus landscape lens; 32s. 6d.; good as new.—W. Norgrove, Kingsley Road, Cutham, Bristol.

**For sale, Dallmeyer's 5 by 4 R.R. lens, new condition; £3 8s.**—Address, Barr, 19, Bloom Street, Edgely, Stockport.

**Grubb's portrait o.d.v., A2, cost 90s., for 30s.; Suter's B4 R.R., cost 100s., for 65s.; Wray's 5 by 4 R.R., Iris, f/5.65, cost, nett, 58s. 6d., good as new, 50s.; Optimus portable symmetrical, 5 by 4, perfect, 29s.; fine 5 by 4 R.R., 21s.** — Christie, Newtown-stewart, Ireland.

**Adams' whole-plate R.R. lens and drop shutter, as new, 45s.; cabinet burnisher, 7s. 6d.; 75 numbers AMATEUR PHOTOGRAPHER, current to date, 6s., or offers.**—Arthur Jane, Bodmin, Cornwall.

**Two half rapid rectilinear, one with shutter, perfect definition; together 45s., or offers separate.**—W. Holt, jun., Dabury Park, Didsbury.

**Rapid rectilinear, 7 by 5, covers plate well, 19s. 8d.; cabinet portrait lens, focus about 8 in., lenses about 2½ in. diameter, 30s.; both lenses (by Gillett, London) give capital definition; approval.**—Drake, Amherst Villa, Polsloe Road, Exeter.

**Dallmeyer's 10 by 8 rectilinear landscape lens, £8; Eastman's whole-plate roll holder, latest pattern, £3 10s.; both very little used.**—Dr. Winter, 4, The Birkenlands, Hilsa, Cosham.

**10 by 8 rapid rectilinear lens, £3; 10 by 8 wide-angle, rotating stops, 50s.; half-plate rectilinear, £1, complete with stops, etc.; approval.** — Fowler, Estate Office, East Street Buildings, Manchester Square, W.

**Lancaster's quarter-plate 1890 Instantograph lens, shutter, double slide, and tripod, all as good as new; 30s.**—Ernest Hawkins, 10, St. Domingo Vale, Liverpool.

**Half-plate view lens (Taylor and Hobson), excellent definition, also Tylar's current producer for washing prints and plates of all sizes, both in good condition; 20s.; cost more than double.** — Adams, Ware, Herts.

**Lens, rectilinear, 7 by 5, covers grand to edges, hood, stops f/3 to f/32; 25s.; approval.** — Adams, Hermitage Mews, Stamford Hill.

**Wray's 8½ by 6½ W.A. landscape lens, Kershaw instantaneous shutter, whole-plate size, and whole-plate strong sliding tripod, in first class condition; what offers in cash?** — W. Milburn, Brunswick Street, Carlisle.

**Lenses, Taylor's rapid view and portrait, for half-plates, Iris stops, new; bargain, 28s. 8d.; cost 38s.**—Hethion Lewis, Lansdowne Street, Brighton.

**Sets.**—Quarter-plate photographic apparatus; cost £8; price £3.—7, Dereham Road, Norwich.

It will be remembered that through the efforts of Mr. Lewis M. Biden a society for the federation of photographic societies for mutual help was formed, and we believe a considerable number of societies will, by this means, derive much benefit. Mr. Biden has addressed the secretaries of the photographic societies, in view of a meeting to be held on the 25th inst., upon the following very pertinent matters:—

"Can you place a dark-room at the disposal of any member of a federated society who may be visiting your neighbourhood, as was so kindly done by the Yarmouth Society last year?"

"Will any of your members place a set or sets of lantern slides, lecture, or paper, at the disposal of any other society for one or two evenings' entertainment? Have you not had some paper read before your Society that is worthy of repetition—particularly if with the author's illustrations?"

"Could your Society undertake to be represented by say six or twelve sets of photographs, framed, or mounted only, to be lent to other societies for exhibition purposes, and not for competition? The smaller societies find considerable difficulty in getting sufficient exhibits, indeed, some have had to give up intended exhibitions simply for this reason. I need not dilate on the educational value of such

a loan collection in affording our less advanced brethren an opportunity of studying good work from other districts."

To us there certainly seems ample work for a central society or a federation of societies. The larger photographic societies have so much business of their own to attend to that there seems a difficulty in their lending their lesser brethren a hand, and we can quite understand that the mere fact of allowing other societies to have certain privileges when affiliated to them does not meet the views of a man so active and desirous to advance the good of the greatest number interested in photography as is Mr. Biden. We wish him every success, and feel sure that if provincial secretaries will throw in their lot, heart and soul, with the federation scheme much good will be done for all.

A VERY effectively got up little pamphlet, "The Thames Trip," and a courteous invitation from Messrs. Salter Bros., of Oxford, remind us that the "Summer trips on the River Thames have commenced." A more delightful trip for those who love river scenery cannot be desired; the whole journey from Kingston to Oxford presents scores of pictures to the photographer. The journey is done easily, spending one night at Henley on either journey. The frequent stoppages in going through the locks give ample opportunity for those who wish to photograph. The steamers are fitted up with dark-rooms, etc., and the captain of each craft, if not a photographer himself, knows exactly what the amateur photographer wants to know. Some particulars of the trip will be found in the AM:PHOT: vol. xii., September 19th, and we shall hope to give a short account later in the season, when we hope to avail ourselves of Messrs. Salter's invitation.

AN International Exhibition of photographs and photographic apparatus will be held at Amsterdam next September. The art section will be open to amateurs and professional photographers. We understand that it is twelve years since such an exhibition was held in Amsterdam, and the scheme is causing a considerable amount of excitement. All particulars may be obtained of Mr. C. Y. Schuwer, 72, P. C. Hooftsh, Amsterdam. We are authorised to say that Mr. Schuwer will be very pleased to give any help to amateur photographers visiting Holland, advising them as to best routes, etc. There are at present three photographic societies in Holland, at Haarlem, Gronnigen, and Amsterdam. The chief or national society, open alike to amateurs and professionals, is at Amsterdam.

THE *Nineteenth Century* for May contains an article of interest to photographers. "Resuscitation by Oxygen," by Lieut.-Colonel Henry Elsdale, R.E., serves a twofold purpose, the first, as its title would denote, *i.e.*, the use of oxygen for the saving of life, or the resuscitation of persons apparently dead, and which Colonel Elsdale proves conclusively is far more active in its work than any other known means of artificially restoring respiration; the second purpose of the article is to caution the users of compressed oxygen, as to its dangers and the precautions to be taken. This part of the article is at the present time of such peculiar interest that we shall be pardoned for quoting at some length:—

"Oxygen, as is well known, has a great affinity for metals. It will not, however, attack the metal of the steel reservoirs and valves, in its cold or normal state. But it is extremely dangerous to expose the oxygen under these high pressures to any oil or any hydrocarbon whatsoever, as it has a still higher affinity for them. Now pressure-gauges or dynamometers for determining the pressure of gas or steam, as ordinarily constructed and used, are lubricated internally with such oils. When the oxygen reservoir has been partly emptied by use, there is a natural temptation to determine how much oxygen may remain in the vessel by applying such a pressure-gauge to determine the then existing pressure. The danger of this course may be best illustrated by an accident which I have known to happen more than once. The oxygen, rushing into the pressure-gauge, comes suddenly in contact with the lubricating oil. Its powerful affinity for the hydrocarbon, combined with the sudden rush, is too strong for it. The result is a very violent explosion, which blows the glass or the gauge, and probably its metal case also, into fragments. The glass is driven all around in small pieces, at the imminent risk of blinding the bystanders. But the explosion, once started, does not stop there. The heat, and strong chemical action developed by it, bring into active play the great dormant affinity of the oxygen for the metals in contact with it. It instantly attacks and burns any remaining portions of the metal pressure-gauge. It then with extreme rapidity burns back along the small copper tube which is generally used as a connection between the oxygen reservoir and the pressure-gauge, consuming the copper as it goes. In another instant it has attacked the metal, such as gun metal or Delta metal of its own main valve, and the steel of the reservoir tube into which the valve is screwed. The half melted valve is blown out bodily, like a shot out of a gun, by the imprisoned oxygen within, which then escapes, but not before it has fiercely attacked and ruined the steel of the reservoir itself.

"It will be seen that such a disastrous accident as this depends primarily upon the great affinity of the compressed oxygen for the lubricating hydrocarbon of the gauge. After this the almost instantaneous spread of the mischief depends upon the powerful affinity of the oxygen for metals. For I repeat that oxygen, under these great pressures, will attack anything, once a strong chemical reaction is started by such an initial explosion.

"All ordinary pressure-gauges, such as are in universal use for testing the pressure of steam in boilers, must be carefully avoided. A special gauge only, which has been taken to pieces by a skilled and thoroughly trustworthy mechanic, and carefully cleansed from every particle of the lubricating oil, by ether, or by some similar dissolvent to the oil, should be employed; no oil, or grease, or anything of the nature of a hydrocarbon, should be used in or in connection with it, as for lubricating the threads of the screw by which it is screwed on. It should be kept and applied in a perfectly dry and clean condition. . . . I do not assert that the use of any quantity of such a lubricant, say, on the screwed thread of a union joint, will necessarily, or even probably, determine an explosion. It is possible, I think, that in order to obtain the conditions necessary for such spontaneous combustion, we require to have the particles of the hydrocarbon driven round and round with the rushing oxygen in a state of very minute sub-division, as may naturally occur on the first rush of the oxygen under pressure into a lubricated gauge."

Those who have recently shown an interest in the explosion of Mr. Brandreth's valve will read the foregoing with much interest, and we are quite hopeful that it may assist the discussion upon the subject when the meeting is called upon Mr. Brandreth's return to England.

Yet another photographic exhibition, and this time at Leeds, and, which is rather curious, it is to be promoted by the Free Public Library Committee, and not by the

local society. On the 15th inst. the committee adopted a recommendation made by the Fine Art Gallery Committee to the effect that an exhibition of photographs should be held in the autumn on the lines suggested by Mr. W. H. Bothamley, Mr. Godfrey Bingley, and Mr. F. W. Branson, the two latter being members of the Leeds Photographic Society, and the former President of the Photographic Convention of the United Kingdom. The suggestion was made by these gentlemen in their private capacity, and not as officially representing either of the bodies to which they belong. We look forward with considerable interest to the details of the exhibition.

PHOTOGRAPHERS have devoted much attention to church architecture, and occasionally those connected with the Church have paid some attention to photography. On June 9th, 10th, and 11th there is to be a bazaar for the purpose of raising money in aid of the Building Fund of Christ Church, Sutton, and the Managing Committee have decided that there shall be a photographic competition and exhibition in connection therewith. Gold, silver, and bronze medals and certificates are to be awarded, and one of the conditions of entry is that the competitor shall, at the option of the Committee, contribute a mounted copy of his exhibit for sale at a photographic stall for the benefit of the Fund. There are to be eight classes: architecture, landscape, seascape and river scenery, portraits, subject pictures, instantaneous (subject must be such as to necessitate the use of a rapid shutter), transparencies, and lantern-slides. The work must be entirely that of the exhibitor, and no photograph will be eligible which has previously received a prize in open competition.

THAT enterprising and well got up magazine, *The Strand*, for May contains an interesting and humorous article on "A Day with an East End Photographer," which is profusely illustrated. Judging from the specimens of that gentleman's work given, he was above the average, and deserved all the success he attained by his Herculean exertions to secure customers, and then to please them.

It is, doubtless, perfectly true that the photographer is far more ubiquitous now than was the case a few years ago, and that he is called in on many occasions interesting to those concerned, but we much doubt whether the following extract from a contemporary gives quite a true idea of the state of affairs:—

"The photographer is now considered as necessary to the well-being of fashionable English society as the baker, the bootmaker, and the dressmaker. Many mothers have their children regularly photographed on each birthday. Babies are photographed in their little bare skins a few days after their birth, and a copy pasted in the family Bible—a valuable record of any birth-mark. A new gown is photographed—as a matter of course on the back of its wearer—and so is a new hat. The photographer is now sent for on all occasions of family rejoicing. He photographs the bride as she is tripping down the steps to the carriage preliminary to the honeymoon; he photographs the wedding breakfast at the moment when papa is wishing success to the happy pair; he photographs the *débutante* as she looked on departing for her first ball, or on her way to the Queen's Drawing-room; and he throws his camera on the sleeping form in the coffin, before it is consigned to the family vault."

WE have to chronicle the discovery of two new developing agents, one that of MM. Auguste and Louis Lumière, paramido-phenol, the other, of M. A. Noel, kinocyanine. We are unfortunately unable to do more than chronicle these discoveries, but next week we shall hope to give further details as to their chemical constitution and properties, and formulæ for the developers.

DR. E. VOGEL, the son of the famous professor, Dr. H. W. Vogel, has succeeded in preparing collodio-bromide of silver emulsion, which is equal in sensitiveness to the ordinary gelatine plate. Several English workers have also been trying for the same end, notably Dr. Hill Norris and Mr. J. B. B. Wellington.

WE noted some weeks back the perfecting of a collotype process for amateurs which could be used with the ordinary copying press. We expected to have been able to give full formulæ and working details this week. Pressure upon our space has compelled us to hold over the article, but we hope to include the same in an early issue. Collotype is by no means a difficult process, and the outlay according to the process we now speak of, perfected by M. Lavroff, the editor of our Russian contemporary, the *Amateur Photographer*, is not great, and many of our readers could do worse than try it.

OF celluloid and its uses in photography we have not yet heard the end. Herr Volkmer has described a process in which a gelatine relief image is obtained on a copper plate, and this relief is then pressed into soft celluloid, and the very finest details most religiously reproduced. The celluloid is then hardened, and a large number of impressions can be pulled from this, having all the beauty of the very finest photogravures.

WE would remind our readers that the 1890 Prize Lantern-slides, which are all in first-class condition for exhibition, may be booked for next season. Many dates have been taken, and it will be well to make early application.

The 1891 Prize Slides we shall hope to have ready for exhibition not later than the first or second week in October. The Secretaries of photographic societies who may wish to have the slides will do well to make their applications as early as possible, giving three optional dates. There will be the same number of slides, *i.e.*, 160, and the portraits of the sixteen prize winners. Carriage will have to be paid one way, and in every case a fee of *one shilling* booking fee must accompany the application. The 1891 "Prize Slides" will be reserved for photographic societies, but the "1890 Slides" are at the call of any of our readers on payment of carriage both ways and the booking fee of *one shilling*.

THE question of the definition of an amateur is again to the front, as is shown by our correspondence columns for the last week or two. Is it not about time that some authoritative body drew up and promulgated a definition which could be generally recognised? The question might be discussed at the Convention, where there will be representatives of both amateurs and professionals, or, possibly, failing that, the Photographic Society of Great Britain might take the matter up and thoroughly thrash it out, so that it should be laid to rest for ever. Or are these two bodies so very conservative that they will not care to tackle the question? New brooms proverbially sweep clean, so possibly the new-born Federation may do something in the matter; but any way, we should much like to know who will undertake to bell the cat?

#### HOME PORTRAITURE.

ARTIFICIAL light for portrait work may be classed into several divisions, such as electric light, magnesium ribbon, magnesium flash, oil lamps, and gas. Electric light we may dismiss at once, as few amongst us have an installation ready to hand. Magnesium ribbon requires more attention,

though this has to a great extent been replaced by the flashlight.

WE need not again enter into the question of posing, but merely give a few hints as to lighting. Our plan is to pose and focus the sitter, and place on one side of the sitter, which should be the shadow side, a lamp about one yard off and slightly to the front, just so as not to show on the focussing screen. We then use a pair of household steps, mount these, and have some helper to remove the cap of the lens at the moment we light twelve inches of magnesium ribbon, which is waved about. The steps are placed slightly to one side of the camera; the burning ribbon is moved about so as to equalise the illumination, and the two final inches are brought so as to illuminate the shadow side of face. The disadvantage of burning magnesium in the room is that the oxide or magnesia formed flies about and settles on everything, and if two or three exposures have to be made one after the other, the negatives obtained subsequent to the first are foggy and hazy. To obviate this, it is advisable to obtain one of Lancaster's magnesium lamps, and use this, which, after the ribbon has been burnt, merely requires opening in the open-air and the magnesia flies off. This also possesses a reflector, which throws the light on to the sitter more, and, therefore, actually less ribbon is required than when the ribbon is used alone. A large white reflector should be used with magnesium, the same as with ordinary daylight. There is one point which it is advisable to note, and that is that magnesium ribbon, and not wire, should be used, and, secondly, that magnesium ribbon which has been kept for some time is frequently oxidised on the surface. This should always be removed by drawing the ribbon once or twice through emery paper, or else between the nails. If much oxidised, the ribbon will splutter, and we have known it to be quite extinguished.

Our notes on the flashlight we must defer till next week, as, in consequence of the holidays, we have been unable to obtain a block which we desire to illustrate our notes with.

Few of our readers will believe in the use of an oil lamp, but there is one method which has given us fairly good results for profile and three-quarter-face portraits, and which may also be used for full face with a little ingenuity and contrivance. Still, this is only to be done by the possessors of an optical (or magic) lantern. The lamp is lighted and the circle of light directed on to the sitter, and so adjusted that no heavy black shadow appears on one side of the face, and also so that no black shadow appears on the background. An ordinary lamp should be used to light up the shadow side of the face, and in all artificial-light work the room should be as well lit up as possible so as to avoid great staring pupils to the eyes, and when this is not feasible without giving false lighting, the sitter should be made to look at a lighted lamp. The exposure required with such an arrangement is about twenty to thirty seconds, but if the limelight is to be had, ten seconds will be plenty.

An important point when working with artificial light is to use as rapid a plate as possible, and *it must be colour-sensitive*, or isochromatic or orthochromatic. Edwards' instantaneous isochromatic, or Obernetter's orthochromatic (Gotz, 19, Buckingham Street, Strand, agent) may be used; but for those who have a predilection for sensitising their own plates we should advise them to obtain some of Vogel's azaline tincture from Mr. Gotz, and use this. Eosin or erythrosin cannot be used without a licence from Messrs. B. J. Edwards and Co. Vogel's azaline solution, when used according to the directions, makes the plates more sensitive to ordinary white light than they would otherwise be, and the yellow sensitiveness is enormously increased, and plates thus prepared will keep for at least two months, and may be prepared in the evening and be ready for use next day.

## Letters to the Editor.

### THE EXPLOSION IN A GAS REGULATOR.

SIR,—I entirely withdraw the observations that I made about Mr. Brandreth with reference to the explosion of his oxygen regulator. Singularly enough, there is an article in the *Nineteenth Century* for May, by Col. Elsdale, R.E., which entirely solves the mystery of the explosion. He evidently writes from personal and not infrequent experience.

Col. Elsdale says that oxygen, although possessed of great affinity for metals, will not attack the metal of the steel bottles in its cold or normal state, but that it is extremely dangerous to expose oxygen under high pressure to any oil or any hydrocarbon whatsoever, as it has a still higher affinity for them. But pressure-gauges, as ordinarily constructed, are lubricated internally with such oils.

He goes on to say that he has known, more than once, the following accident to happen. The oxygen, rushing into the pressure-gauge, comes suddenly into contact with the lubricating oil; the affinity being so great, a violent explosion takes place. The heat and strong chemical action thus started bring into active play the great dormant affinity of oxygen for the metal in contact with it. It instantly attacks and burns any remaining portion of the pressure-gauge, and then, with extreme rapidity, burns back along the connecting metal tube. In another instant it has attacked the metal of the bottle valve, and the steel bottle into which it is screwed. The valve is blown out bodily like a hot from a gun, and by the time the gas has all escaped it has fiercely attacked and ruined the steel shell of the bottle itself.

I imagine that precisely the same remarks will hold good of the regulators that are in common use, and there can be little or no doubt that this was the cause of the explosion of Mr. Brandreth's regulator. The repeated turning on and off of the bottle valve was too much for the oxygen in contact with the small quantity of lubricating oil in the regulator; being provoked so frequently, it lost its temper, as it were, and produced the explosion, and I cannot but think that Mr. Brandreth and those about him had a providential escape from a most serious accident.

Col. Elsdale goes on to say that all pressure-gauges (and, by implication, regulators also) should be very carefully cleaned from every particle of lubricating oil, and that no oil or grease, or anything of the nature of a hydrocarbon, should be used in connection with them. Still, he concludes that it does not necessarily follow that the use of oil as a lubricator will cause an explosion; he is inclined to think that in order to obtain the conditions necessary for such a spontaneous combustion we require to have the particles of the hydrocarbon driven round and round with the rushing oxygen in a state of very minute subdivision.

Personally, I think that the danger will be reduced to a minimum if the valve of the bottles be turned on as slowly and carefully as possible at first. Still, the question arises in one's mind, Is it quite safe to have india-rubber, as the material forming the bellows, operated upon by the oxygen as it rushes into the regulator?

WERNER H. K. SOAMES.

\* \* \* \*

### WHAT IS AN AMATEUR?

SIR,—I quite agree with some letters in the *AMATEUR PHOTOGRAPHER* of May 8th. As Mr. James says, when anyone sends birds or poultry to an exhibition he does not hesitate to put a price on his exhibits. Why should not an amateur photographer be allowed to do so? It is all very well for some distinguished amateurs who have plenty of cash at their disposal, and can afford to give many pictures away, to say that an amateur must not sell any of his work or else he becomes a professional, but besides the trouble it becomes expensive to give away as many photographs as one's numerous friends would like.

I maintain that an amateur may make a charge for his pictures if anyone wants copies, and he does not try to sell them. Of course, to be an amateur he must not make a public exhibition of his pictures and so try to create a sale, but may try to defray the cost of his hobby.—I am, yours, etc.,

YXOL.

May 20th, 1891.

SIR,—In my opinion the term amateur is used in opposition to the term professional, and means one who uses photography as a

"hobby" and not as a means of "earning a living," and though the question of "earning money" has been more than once discussed, as differing from a "professional" only in degree, there has been no definite or binding decision on the subject.

The harmonious way in which both amateurs and professionals meet in many of our best societies shows that such a decision is unnecessary, and that the distinction is only made for exhibition purposes, and in my opinion it had better be done away with, and a broader basis be adopted, "that the exhibits in the first class be entirely the work of one person, and in the second class of more than one." This line of decision would admit of no misunderstanding, and no true amateur would object to compete against a professional under what must be equal terms, while the tendency would be towards higher and better class work all round.—Yours, etc.,

S. N.

May 20th, 1891.

### FEER'S PROCESS.

THE following is the translation of the German patent specification (No. 53455) of Dr. Adolf Feer's process for the production of coloured photographic prints, a question about which was given in our Quarterly Examinations, and which proved a stumbling-block to every competitor but one:—The present process is founded on the fact that, as the inventor has discovered, diazo-sulphonic salts ( $R-N \equiv N-SO_3Na$ ) react with phenol alkalis and hydrochloric or free aromatic amines, under the action of solar or electric light with the formation of the corresponding azo colouring matters. For the carrying out of this process, the inventor impregnates paper or cloth with a dilute molecular mixture of a diazo-sulphonic salt (e.g., aniline amido-azo-benzol) and phenol alkalis (e.g., phenol, resorcin, A and B naphthol) or hydrochlorate or free amines (aniline, naphthylamine, phenylendiamine). The paper or material is then dried in the dark, and then exposed under a negative for about five minutes to solar or electric light. By this means there is formed on the exposed places the insoluble azo dyes, whilst on the parts protected by the dark parts of the negative, the preparation remains in its original conditions of colourlessness and solubility. By this means the image is developed. After exposure, it is washed with water or dilute hydrochloric acid, by which means the unaltered preparation which remains unexposed under the negative is removed, and the image is fixed, and the impression, when dry, is finished. The following are some of the solutions with which the paper or material is treated:—

(1)	
Toluol-diazo-sulphonate of sodium ...	25 grammes.
B naphthol ...	25 "
Caustic soda ...	8 "
Water ...	1,000 "

(2)	
Ditoly-tetrazo-sulphonate of sodium ...	25 grammes.
M phenylendiamine ...	20 "
Water ...	1,000 "

(3)	
Ditoly-tetrazo-sulphonate of sodium ...	25 grammes.
Resorcin... ..	22 "
Caustic soda ...	16 "
Water ...	1,000 "

The following solutions will show the application of ditoly-tetrazo-sulphonate of sodium mixed with resorcin and A naphthol, or with A naphthol and phenylendiamine:—

(1)	
Ditoly-tetrazo-sulphonate of sodium ...	30 grammes.
Resorcin... ..	20 "
Solid caustic soda ...	15 "
Water ...	1,000 "

Powder the salts, and dissolve by the aid of a gentle heat.

(2)	
Ditoly-tetrazo-sulphonate of soda ...	30 grammes.
A naphthol ...	25 "
Caustic soda ...	7 "
Water ...	1,000 "

(3)	
Ditoly-tetrazo-sulphonate of sodium ...	30 grammes.
Phenylendiamine ...	20 "
Water ...	1,000 "

Solutions 1 and 2, or 2 and 3, can be mixed together in equal parts for the sensitising liquid. The paper is impregnated with the desired mixture, dried in the dark, then exposed under the negative for 10 or 15 minutes to direct sunlight. After exposure, it is washed with dilute hydrochloric acid, and finally with water.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER X.

WE come now to speak of the circular form of composition, which is applicable to the highest walks of art, from its

FIG. 21.—RAPHAEL.

simplicity and extensive sweep; and to the lowest, from its being finely adapted for the purposes of light and shade.

Fig. 21. In this cartoon we have a fine specimen of this form of composition. In the design a strict adherence to the plan laid down has secured a decided character to the picture. With Raphael this seems to have been invariably of the first importance; his worst compositions have always a strong feature to recommend them. In this design we have the figures gradually declining from the sides to the centre of the circle on the foreground, which enables the spectator to view the whole of the persons employed; to assist which arrangement, Raphael has placed the Apostles on an elevated plane; and by placing the principal in the centre, has enabled them to acquire that consequence their diminution would otherwise have deprived them of. The regularity of the composition is also increased by the division of the group into seven figures on each side, and no one, except Ananias and Sapphira, performs an action that is not repeated. Thus simply has Raphael contrived not only to tell his story, but also those circumstances which preceded and followed it. This regularity will strike the student as being particularly suited to religious subjects; but a few attempts, to make such uniformity appear a natural emanation, will compel him to exclaim with the poet,

"Within that circle none durst walk but he."

As I shall have occasion to speak of the repetition of form, as being no less essential towards the production of harmony than the repetition of colour, I may call the student's attention to it in this place. In compositions embracing many figures, a repetition of form and action is often found to be indispensable; a single figure, in such case, being found

too small to give importance to any action, is referred to the next for assistance; as, in colouring, one colour is often made to depend upon the adjoining for its shadow or enlargement. But, independently of its acquiring a consequence by such extension, harmony requires that a strong action should be as it were broken down and diffused through the group. In writing, this is generally the case, and the reader is prepared for one sentence by what has preceded it. This simplicity and harmonious communication is to be found in nature, in the antique, in the best Italian masters, and in

many of the Dutch, particularly Ostade.

In compositions of out-of-door scenes, this circular form of arrangement is often the only opportunity we have of procuring a mass of shade so necessary to the group in a pictorial point of view. I am aware that some sculptors consider the arrangement of their figures degraded by any attention to the picturesque effect of light and shade, which to painters seems more extraordinary, as sculptors have not the means of local colour to produce it. With sculpture, however, it is not our province to interfere.

The cartoon of the death of Ananias is one of the finest compositions of Raphael, and has been wisely selected by

Burnet as an example of an arrangement of lines and masses suitable to every class of art. The form selected to illustrate a Scripture miracle is also quite suitable for the most ordinary photographic group. We know well what this latter arrangement usually is. If the photographer has to undertake twenty or thirty figures, he places some standing in a row, some sitting in a row, and some

FIG. 22.—REMBRANDT.

lying in a row, with the soles of their boots to the camera and their figures foreshortened; moreover, the crowd is huddled and squeezed together, apparently for the purpose of making each figure look as large as possible, with, however, the contrary effect. In Raphael's design we have twenty-four figures, certainly not crowded, none of them looking small, and the space is well filled. It would require very little ingenuity to compose a modern group

on the same lines. There are many things worth considering in this cartoon; the variety of the masses, the opposition of the gestures, the play of line and flow of draperies, and the unforced prominence of the principal figures. Numerous and important figures are much nearer to the spectator than Peter, the cause of the action, yet he stands forth conspicuously. Besides his central position, Peter has alone the advantage of the free display of his full height; even the apostle who points to heaven, and seems almost as direct an agent of wrath as himself, is sufficiently subordinated by so simple a device as the interposition of the post and rail of the dais. The prominent effect is aided still further by the hand of the figure that stoops over the fallen man and at the same time points to the apostle; this action serving also to connect the two groups. The attitudes of the group of apostles on the dais afford a fine example of well-ordered variety.

Every design of Raphael's is worthy of the most attentive study of the student of composition. In these notes I prefer to give the opinions of others to my own, and quote the following from "Leslie's Handbook for Young Painters," which may contain a valuable hint to the student: "The lofty imagination of Raphael, the wonderful fertility of his invention, with all his extraordinary dramatic power and his deep knowledge of human nature, would never have made him what he is, had it not been for that indescribable natural urbanity, that true decorum which we can only associate with the purest taste, and which pervades every work of his hand, from his earliest attempts to the grandest of his frescoes. And the decorum of Raphael's mind is shown, not in his avoiding subjects which a less natural man might be afraid of, but in his treatment of every class of subject."

Fig. 22, by Rembrandt, is an example of the same kind of composition.

## The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

*Instructor in Photography, City of Dublin Technical Schools.*

### CHAPTER V.

#### ON TESTING PHOTOGRAPHIC LENSES.

To test anything means to compare it with something else taken as type, and this being the case it would obviously be as absurd to pronounce an opinion upon a lens by the mere inspection of the work done by it, as it would be to estimate the correctness of a yard measure by looking at a length of calico measured by means of it.

The following are the chief factors which should be determined for every lens in actual use:—

1. Its focal length and the position of the nodal points of admission and emission.
2. The extent, depth, and degree of illumination of its field of definition.
3. The amount of spherical aberration it possesses.
4. The presence or absence of distortion and of chromatic aberration.

All these measurements can be effected on the following simple form of optical bench:—

A B C D is a 4-foot board of inch, well-seasoned pine, planed up true and with the edges A B C D exactly parallel to each other (fig. 24). Along A B and C D are screwed

FIG. 24.

two guides, projecting an inch above the surface, and one of these is graduated in inches, tenths, and hundredths.

Along this board slides, between the guides, the focussing board, E F G H.

This latter, shown in elevation in fig. 25, consists of a 12-inch support carrying an upright at right angles to it, pierced with a rectangular aperture, 3 by 1 inch. Another board slides up and down between guides over this, and carries the focussing magnifier, consisting of the Ramsden eye-piece of a small telescope. A nut and bolt serve to secure the magnifier in any position. The magnifier is screwed into a brass plate, itself attached to the sliding board pierced with a round hole.

Another focussing board, shown in fig. 26, is also provided. This consists of an upright board, A D, 18 inches long and 12 inches high, attached at right angles to a piece B C, itself capable of moving to and fro over the top

FIG. 26.

of the bench. This board is pierced with a rectangular aperture E F, 5 by 16 inches, and in this slides a square piece of wood of the same width as the aperture. Behind this are two guides (not shown in the figure) to prevent it from falling out, and in front of it are two uprights shown, between which the board carrying the magnifier slides up and down. The square piece fitting into E F being pierced with an aperture 4 inches square, it will be understood that the magnifier can be moved to and fro along E F or up and down.

The lens board consists of an 11-inch square of pine, having a 10-inch circle of the same wood revolving over it (fig. 27). This latter is graduated in degrees, and a wire projecting over the graduations and with its lower end fixed to the square board, serves to show the angle through which the circular board has been rotated. Over the graduated circle a piece of  $\frac{1}{4}$ -inch pine, A C, slides between two guides.

FIG. 27.

To make the lens support, a piece of  $\frac{1}{8}$  sheet brass, 5 by 3 inches in size, is cut as shown in fig. 28, A being 1 by  $\frac{1}{4}$  inch, B and C  $\frac{1}{2}$  by  $\frac{1}{4}$  inch. This is then bent so as to form part of a cylinder, whose axis lies along A D, and the pieces B C having been turned down, a

FIG. 28.

2-inch brass pin is soldered to the centre of each of them. A is first turned down at right angles to A D, and half is then bent up so as to be parallel to A D. At the extremity of this portion is soldered the brass thread of a levelling screw 3 inches long.

In the cylinder the lens rests, and the levelling screw

attached to A used in conjunction with the pins B C serve to centre it. The whole arrangement rests upon the board A C in fig. 27.

It will be readily understood from the description that a lens resting in the cylinder, itself on the board over the graduated circle, can be adjusted so that its axis is parallel to the surface of the board, and can then be moved to and fro, so that any point along its axis can be brought over the centre of rotation.

The lens being in position over the movable circle and the square board carrying the latter being placed on A B C D (fig. 24), it is clear that the levelling screw provides a means of rendering the axis of the lens parallel to the surface of the board, whilst the fact that the lens board is narrower than B D enables the axis to be rendered parallel to the edge of the board or to the axis of the magnifier, whilst the up and down motion of the latter enables the axis of both magnifier and lens to be brought into the same straight line.

Another board, 12 feet long, is also provided, carrying, like the optical bench, an upright capable of moving to and fro between guide pieces screwed to the side of the 4-foot board. This upright itself carries a slit of brass capable of up and down motion, and the distance between whose jaws can be altered at will.

At the other end of the 4-foot board is pivoted a square piece capable of sliding along the optical bench proper. It will be understood from the description that this board can be placed at any point on the optical bench and then tilted so as to make any angle with the latter. To show through what angle it has been moved, the end rotating over the bench is cut to a semicircle and graduated into degrees.

(To be continued.)

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 314.)

CHLORINE in the free state is usually prepared, directly or indirectly, from hydrochloric acid. The hydrogen is oxidised to water, whilst the chlorine is liberated. This action takes place to a limited extent when a mixture of hydrogen chloride and oxygen is passed through a red hot tube, thus,  $2\text{HCl} + \text{O} = \text{Cl}_2 + \text{H}_2\text{O}$ . It is, however, most easily brought about by the action of certain oxidising substances, such as manganese dioxide  $\text{MnO}_2$ , lead dioxide  $\text{PbO}_2$  and potassium dichromate  $\text{K}_2\text{Cr}_2\text{O}_7$ . Hydrogen peroxide and all other peroxides yield water and chlorine by interaction with hydrochloric acid.

EXPERIMENT 130.—In a large test tube heat some manganese dioxide gently with strong hydrochloric acid; observe that a yellowish green gas is given off, which has a powerful and disagreeable odour and bleaches a piece of litmus paper.  $\text{MnO}_2 + 4\text{HCl} = \text{Cl}_2 + 2\text{H}_2\text{O} + \text{MnCl}_2$ .

EXPERIMENT 131.—Perform a similar experiment with red lead ( $\text{Pb}_3\text{O}_4$ ); no heat is necessary in this case.  $\text{Pb}_3\text{O}_4 + 8\text{HCl} = \text{Cl}_2 + 4\text{H}_2\text{O} + 3\text{PbCl}_2$ .

EXPERIMENT 132.—Perform a similar experiment with potassium dichromate  $\text{K}_2\text{Cr}_2\text{O}_7 + 14\text{HCl} = 3\text{Cl}_2 + 7\text{H}_2\text{O} + \text{Cr}_2\text{Cl}_6 + 2\text{KCl}$ .

Observe that in all these cases part of the chlorine remains in combination with the metallic constituent of the oxidising agent.

EXPERIMENT 133.—In order to prepare a larger quantity of chlorine grind together 30 grammes common salt and 30 grammes manganese dioxide, put the mixture into a flask similar to that used for the manufacture of hydrogen chloride, pour down the funnel tube a mixture of 35 c.c. of strong

sulphuric acid with 35 c.c. of water (previously allowed to cool), and agitate gently until the whole of the solid mixture is thoroughly wetted by the acid. Chlorine will begin to come off steadily at the ordinary temperature, and the evolution is assisted by a gentle heat, but becomes too rapid if the mixture is allowed to get too hot. Collect the gas in four dry bottles by displacement as in the case of hydrogen chloride,  $2\text{NaCl} + \text{MnO}_2 + 2\text{H}_2\text{SO}_4 = \text{Cl}_2 + 2\text{H}_2\text{O} + \text{Na}_2\text{SO}_4 + \text{MnSO}_4$ .

N.B.—The preparation and collection of chlorine and the experiments with it *must only* be done in a proper draught chamber or in the open air. Even when present in the air in only small quantities, chlorine is very irritating and injurious to the lungs, etc. If any of the gas should be accidentally inhaled, the best remedy is to pour alcohol on the hand or on a cloth and inhale the vapour.

The greenish-yellow colour of the gas will be seen better in the bottles than in the tubes used in previous experiments, and in fact, it serves as an indication that the bottles are completely filled.

EXPERIMENT 134.—Into one of the bottles introduce some imitation gold leaf (Dutch metal) on the end of a glass rod. Combination will take place between the chlorine and the metal, with development of heat and perhaps light also.

Chlorine combines spontaneously with many metals at the ordinary temperature, forming chlorides, and it combines with others upon heating.

EXPERIMENT 135.—Into another bottle put a piece of filter paper or tissue paper moistened with turpentine; there will be a flash of flame, and an evolution of black smoke and white acid vapours. The smoke is carbon, the acid vapours are hydrogen chloride, and the change which takes place is represented by the equation.  $\text{C}_{10}\text{H}_{16} + 8\text{Cl}_2 = \text{C}_{10} + 16\text{HCl}$ , turpentine being a hydro-carbon (*i.e.* compound of hydrogen and carbon) of the composition  $\text{C}_{10}\text{H}_{16}$ . Chlorine has a great tendency to combine with hydrogen, but very little tendency to combine with carbon.

EXPERIMENT 136.—By gas-light or in weak daylight fill two long test tubes exactly half full of hydrogen, and then pass in chlorine until they are quite full, using a small pneumatic trough and a saturated solution of common salt in place of water. Put one of the tubes with its contents, still standing over strong salt solution, in the dark, and observe that no change takes place even after a long time. Put the other tube in diffused daylight (*not sunlight*), and observe that the colour of the chlorine rapidly disappears, whilst the salt solution rises in the tube. Under the influence of light the hydrogen and chlorine unite to form hydrogen chloride, and the latter is dissolved by the salt solution.

EXPERIMENT 137.—The great tendency of chlorine to combine with hydrogen makes it a powerful bleaching agent. Into one of the bottles of gas pour strong sulphuric acid to a depth of 2 c.m., replace the cover and incline the bottle so that the sides become moistened with the acid, a large surface of the latter being exposed to the action of the gas. The sulphuric acid has a very great attraction for water and dries the chlorine by absorbing water vapour. After the chlorine has been in contact with the acid for an hour or so, introduce into the bottle a strip of turkey-red cloth, or other coloured cloth, previously well dried. Take care that the cloth does not dip into the acid. Observe that the colouring matter is not bleached.

Repeat the experiment, using a bottle of chlorine that has not been treated with sulphuric acid, and a piece of the same cloth that has been wetted with water, the excess of water being squeezed out. Under these conditions *i.e.*, in presence of moisture, the colouring matter will rapidly bleach. Chlorine has a great attraction for hydrogen, and most colouring

matters have some attraction for oxygen; the simultaneous action of chlorine and the colouring matter on the water decomposes it, the hydrogen combining with the chlorine to form hydrogen chloride, whilst the oxygen combines with the colouring matter to form a colourless substance, thus,  $\text{Cl}_2 + \text{H}_2\text{O} + \text{dye} = 2\text{HCl} + \text{oxidised dye}$ . In absence of water, this action of course cannot take place.

The presence of moisture, even in small quantity, not only affects the bleaching action of chlorine, but also its combination with hydrogen and its behaviour towards many other substances.

It is evident that bleaching is a process of indirect oxidation, and this indirect oxidising power of chlorine is very often utilised for obtaining the higher oxides, and the more highly oxidised salts of metals.

EXPERIMENT 138.—To a dilute solution of lead nitrate, add sodium hydroxide solution until the mixture is slightly alkaline; a white precipitate will form. Into the liquid containing the precipitate pass chlorine gas; the white compound will change to dark brown, owing to its conversion into lead peroxide, thus,  $\text{Pb}(\text{OH})_2 + \text{Cl}_2 + \text{H}_2\text{O} = \text{PbO}(\text{OH})_2 + 2\text{HCl}$ .

EXPERIMENT 139.—Perform a similar experiment with a solution of a manganese salt; the manganous hydroxide will change to hydrated manganese peroxide.

Note that the action of chlorine in presence of water in these cases resembles the action of hydrogen peroxide in previous experiments.

Chlorine is readily dissolved by water, which takes up nearly two and a half times its own volume of the gas at the ordinary temperature. The solution is called *chlorine water*; it has the colour, smell, and many other properties of the gas.

EXPERIMENT 140.—Make chlorine water by allowing the gas to bubble through water until the latter acquires a decided greenish-yellow colour. Observe its smell and ascertain whether it will bleach, dissolve imitation (or real) gold leaf, and produce the same results as the gas in Experiments 138 and 139.

EXPERIMENT 141.—Expose some chlorine water to sunlight, observe that after a time the solution becomes colourless, but retains its power of bleaching. After longer exposure, however, the bleaching power also disappears. The exact nature of the change depends on the intensity of the light; in extremely bright light the decomposition is represented by the equation  $\text{Cl}_2 + \text{H}_2\text{O} = 2\text{HCl} + \text{O}$ , but under ordinary conditions it is more accurately represented by the equation  $4\text{H}_2\text{O} + 4\text{Cl}_2 = 4\text{HCl} + 4\text{HClO}$ . The last compound is *hypochlorous acid*: upon prolonged exposure it decomposes into hydrochloric acid, *chloric acid* and oxygen, thus,  $4\text{HClO} = 3\text{HCl} + \text{HClO}_3 + \text{O}$ . It follows that the final result of the prolonged exposure of chlorine water to light under ordinary conditions is represented by the equation  $4\text{H}_2\text{O} + 4\text{Cl}_2 = 7\text{HCl} + \text{HClO}_3 + \text{O}$ .

## Thursday Evenings at the Camera Club.

THURSDAY, the 14th inst., was a lantern evening at the Camera Club, and slides were shown by Messrs. D'Arcis, Pinkney, Fitz-Payne, Phipps Lucas, Chang, Charters White, Humphery, and other members.

The subject on Thursday, May 28th, will be a short paper communicated by M. Leon Vidal, on "A Process of Mechanical Colouring for Carbon Transparencies, Stereoscopic Views, and Lantern Slides."

At this or the subsequent meeting a paper by Professor W. K. Burton, on "A Modified Silver Printing Process," will be read and examples shown.

## Amateur Albums.

By "NESTOR."

How many of us, I wonder, can contemplate this title with tranquility or satisfaction? Alas, I fear, but few. "Amateur albums"—do we not all shudder still at the remembrance of some of them? And are they not to most of us words that recall with painful distinctness the circumstances attending many a miserable failure? The picturesque spot, with its delicate lights and shades, whose photographic image we had fondly hoped would be the gem or at all events the redeeming feature of the collection; the excitement attending exposure, the anxiety during development—waiting for the thing to come out—the joy at getting something—at last; the horror of finding that that confounded bush in the foreground had, after all, come in all down the left side well out of focus, while the top of our walking-stick had furtively crept in at the right-hand bottom corner—do not these words bring all this back to us with horrid vividness? And is not the worst of it all that a something just marring the picture, a something just preventing us from reaching our ideal, is ever occurring in some form or another as regularly as the light of day? I say "ideal," because I believe, nay, am certain, that the motive which first prompts us to invest in our kit is, with most of us, praiseworthy. Captivated by some perfect picture, either a finished portrait or a well-treated landscape, and believing, in the innocence of our hearts, that we have but to touch a trigger, pour something on a plate, and transfer to paper, in order to obtain similar results, we have no rest until, fully equipped, we may advance on the war-path; and then, by George! we go at it *con amore*. Nothing stops us, nothing escapes us. Regardless of time, place, or circumstance, utterly unmindful of other people's feelings, forgetful alike of manners and decorum, we shoot at anybody and everybody, at anything and everything. And further, we rigorously carry out the stereotyped programme—we touch our triggers, we pour on our "something," we transfer to paper, and we get—nothing; or at all events, nothing approaching the ideal which first tempted us to take to the trade. Undaunted, however, we attribute our failure to want of experience in manipulation. So we continue to work away, but still without obtaining the desired result. Becoming desperate, we now turn to a different make of plates and to new developers, possibly also to a new style of printing. And now, having done a lot of work, we start our album, in which, to say the truth, there is no lack of photographs. Every conceivable subject is to be found in it. Portraits—oh, horror!—groups, landscapes, seascapes jostle each other in profusion. Developed by every known agent, from "pyro" and ammonia to eikonogen and soda, they have been printed in every sort of style from ordinary silver to platinotype. And yet, in that album, though ample proof be shown of our zeal and energy, though our knowledge of the various processes employed be apparently complete, there is not probably a single specimen that can, by any possible stretch of imagination, be called a picture.

Now this is rather a melancholy state of things, yet a state which, so far as my experience goes, is very general. Who is to blame? Why should the student of our art, after having done so much work and spent so much time and money in acquiring technical skill, so constantly fail to produce anything of real merit? One reply to the question would be that he has been misled and deceived from the start. He supposed that his camera, plates, chemicals, and paper would make him a picture. He did not know that a knowledge altogether outside exposure, development, and printing is required for such a purpose. Nor had he at all realised the fact that whenever a photograph awakens in us a sense of pleasure akin to what we experience when viewing a good picture at one of the galleries, it might be taken for granted that this further knowledge had, either by accident or design, been made use of in its production.

That some acquaintance with the rules of art is here alluded to, some of your readers will have gleaned, but they are not exactly the rules of art as practised by the artist. We are not, for instance, troubled much with perspective, nor either with the value and balance of colour. We cannot, if we would, heighten or shorten a tree, change the pitch of a roof or the breadth of a tower to obtain more agreeable lines; nor can we, at least not easily, bodily move a clump of trees into our picture, which does not exist within the angle embraced by our lens. But we can do a lot of other things. Instead of snapping away at anything and everything, we can choose, if we know how to, that position

which is nearest in accordance with art rules, and we might wait for that hour best suited to give the breadth of light and shade so necessary to pictorial effect. Moreover, if we cannot put in anything which does not exist, there is often no difficulty in leaving out something that does. How often does it not happen that by vignetting out the surroundings—the foliage out of focus and the top of our walking-stick, for instance—we get a nearly perfect picture, only wanting the introduction of a few shadows and the insertion of some foreground high-lights, the separation of sky from horizon, or of one distant hill from another, to make it absolutely so. And all this can be done, as every skilled photographer knows, and as nearly every extant work on photography tells us—if we would only take the trouble to read them—by a little tissue paper, a few paints, some self-made paper masks, a pencil or two, some cotton-wool, and a little knowledge how to use them, such as is rapidly gained by a few experiments. Yet if this be so, why, in the name of fortune, is it not done? Why continue to commit the fatal error of perpetually changing plates, chemicals, and paper? Why keep on dodging from one thing to another? “Why,” in fact, “soft music,” when such cheap, simple, and efficacious means of remedying every defect are close at hand, only waiting to be made use of? Ignorance, as I have said, is in very many cases the *vera causa*; laziness, perhaps, in some others, to which may be added an insatiate thirst for something new, coupled with that peculiar reluctance to finish thoroughly the work in hand—a common fault in our time of amateur artists of every kind. And yet if the enormous amount of amusement and instruction that is to be got by what may be called “doctoring” a bad negative could but be once realized by the young amateur, and the excellent results which attend the cure be once experienced, it is certain that his photographic life would be a happier one, and the “album,” instead of being a terror to friends and a gloomy record of mis-spent time and wasted money, would be to one and all a never-failing source of pleasure, and a sure means of enhancing the owner's reputation as a photographer.

## Reviews.

*Die Chemischen Wirkungen des Lichtes, Photochemie, Spectral-photographie, die Photographie im Zusammenhang mit Klimatischen Verhältnissen und die Actinometrie.* Published by Wilhelm Knapp, Halle a. S. Price 5s.

This work forms the second part of the first volume of the new edition of Eder's “Handbuch,” and, as its title implies, treats of the chemical action of light, or photo-chemistry, spectro-photography, photography in connection with meteorology, and actinometry. Reviewing this new work of Eder's within reasonable limits is like trying to condense the information given in one volume of our paper into half a column, a task beyond the powers of any man. The information given is of the most complete and exhaustive kind, and above all things recent. The chapter devoted to photo-chemistry treats of the molecular changes produced by light, the combinations and decompositions produced by the same agent, the connection between light and heat, Moser's images, pressure images, the connection between light and electricity, the action of electricity on the sensitive films, etc. In Spectrum Photography we have a summary of the results obtained in this direction, and the action of the various parts of the spectrum. Photography and Meteorology gives us tables of the relative actinic value of the light nearly all over the globe. The section devoted to Photometry is of the most complete and exhaustive kind, and the summary of the commercial kinds of photometers and actinometers or exposure meters is extremely useful. Messrs. Hurter and Driffield's researches are recorded side by side with the very latest opinions, both English and Continental.

Dr. Eder is not content with merely recording the statement of any writer, but gives chapter and verse, and in many cases has added notes of his own, which are by no means the least valuable part of what we may justly call an “epoch making” work on photography, and a work which will stand as a monument to the untiring energy and devotion of the writer to this subject. It is at once the most scientific, the most complete and exhaustive work ever yet published in this department, and will doubtless form a groundwork for many a future work by less renowned writers.

## The Picture Galleries.

### THE NINETEENTH CENTURY ART SOCIETY.

THE twenty-fourth exhibition of members' work opened on Monday, 11th, at the Society's Galleries in Conduit Street, some five hundred works being hung. It is from the contemplation of such a collection as the above that the average student of picture making by photography can learn more than he is able to from larger and more academic displays.

The Nineteenth Century Art Society is composed mainly of young and rising artists, those whose celebrity is all in the future. From the inspection of their works we may see not only the strength and the weakness of painting, but what is more to the point, we can recognise the shortcomings and also the potentialities of photography. Why not equally so, the reader may ask, in such shows as the Royal Academy?

The answer is that, apart from the bewildering number of the canvases which demand attention and confuse the critical faculties, the higher class of artists, as a rule, exhibit in their works to a very large degree the old maxim, *ars est celare artem*, and therefore the humble photographer may admire much and yet learn little.

On entering the gallery, a moonlight entitled “Harvest Eve,” by Maurice Page, is the first to catch our eye. When will photography be able to accomplish the depiction of a real moonlight scene; not a moonshine one taken by sunlight? Mr. Page shows a still better picture entitled “A Gleam in Winter—on the Thame.” The scene so tenderly touched in is one that would admirably lend itself to photographic treatment. This, by the way, reminds us that the amateur will find it worth his while to visit not only this particular but other art exhibitions, in order to obtain hints as to promising localities to work upon. Artists having, not only a trained eye, but plenty of opportunity, often unearth scenes of merit which the diligent amateur “wots not of.” We especially noted down a little bit at Steyning, Sussex, by Powell May, as a spot to be visited with the camera. “Kynance Cove,” by Oxley Nash, is also noteworthy, but the view, like Shanklin Chine, Dovedale, etc., has been painted and photographed *ad nauseam*. “Village Green,” by H. Hague, might be (but isn't) a coloured photograph. It shows us what most prints lack, *i.e.*, a sense of order and arrangement, and an insistence of a dominant interest. Norman Davies is represented by “The Wave,” which shows us a “maiden mit nodings on” stooping as a breaker curls over her; a few photographic studies would have improved the water. Sweetly captivating is the “New England Maiden” by the same gentleman, although it is a thought too smooth and clean in colour. The “Harbour Mouth,” by F. Maitland, is distinctly good, and still more breezy and fresh is his “Morte Race.” In “Breakers,” by Hamilton Marr, we see rocks which no one who has consulted photographic prints of the sea shore would dream of perpetrating. Compare this composition with 171, by Croxford, which, with Brett-like fidelity to the stratigraphical features of the coast, fairly challenges comparison with a photograph. Another work of which the same might be said, is “Bosham Harbour,” by Yeend King. “The League Long Roller,” by Parsons, is suggestive of Mr. Dresser's Jersey sea studies. “Will you Allow us to Pass” is a fine subject evidently spoilt by hurry and by a lack of perspective knowledge. The painter, Mr. H. G. Shaw, possesses such an undoubted genius for animal painting that we counsel him to employ the “magic of patience” when painting in backgrounds. “In a Warm Corner” is one of several clever still-life studies by J. Fitz-Marshall, apropos of which, why do amateurs give us so few photographic still-life studies?

Our catalogue is marked with notes of a number of pictures and studies, the authors of which would have escaped from being convicted of glaring inaccuracies of drawing had they made a free use of our art-science. But it would be hardly a pleasant task to pillory those who at present are only “learning to walk.” Suffice it to say that the painters of animals and figures are the chief offenders, and trees, rocks, and skies are objects which artists seem to have some difficulty in accurately delineating.

**Correction.**—A correspondent writes:—“Will you allow me to correct a slight mistake in your issue for last week? On page 349, in your notice of M. Vidal's lecture, you say, ‘Specimens were contributed by . . . Haufstangel, Munich.’ This gentleman's name is *Haufstangel*.”

## "Amateur Photographer" Dark-Rooms, 1891.

THE "DARK-ROOMS" kindly placed at our service for the use of amateur photographers are classed as follows:—

*a* Amateur *d* Dealer or professional.  
*h* Hotel *s* Photographic society.

NOTE.—At the time of going to press we have not received signed authority for the use of "Dark-rooms" marked\*; but they were all placed at our disposal last year, and are doubtless available.—Ed. AM: PHOT:

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and plainly endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

#### LABELS FOR BOXES OF UNEXPOSED PLATES.

The following list in different languages may prove of service to the tourist; it has been kindly supplied to us by Mr. W. E. Woodbury:—

*English*.—Sensitive photographic plates, which will be quite spoilt if opened in the light. Only to be opened in a totally dark room or by a red light.

*French*.—Plaques photographiques sensibilisées qui seront gâtées si on les expose au grand jour, par conséquence n'ouvrir la boîte que dans une chambre parfaitement obscure ou éclairée à lumière rouge.

*German*.—Photographische Trockenplatten, welche sehr lichtempfindlich sind. Werden ganz verdorben wenn man sie dem Tageslichte ausstellt. Die Schachtel muss desshalb nur in einem finsternem Zimmer, oder beim rothen Lichte geöffnet werden.

*Spanish*.—Las placas fotograficas sensitivas, que se inutilizan si se las expone al abrirlas a la luz del dia, se pueden abrir sin inconveniente en un cuarto enteramente obscuro o iluminado par luz roja.

*Portuguese*.—Laminas fotograficas sensitivas. Nao podemsem expostas á luz porque se inutilizam; podendo só ser abertas eh camara, escura oce com luz vermelho.

*Dutch*.—Chemisch toebereide photographische platen weke gehue bedorven worden als zy aan de lucus worden blaagteschild. Alleen te openen in eene donkere kamer of by rood licht.

*Italian*.—Lastre fotografiche sensitive le quali si guasteranno se esposte alla luce. Debbono aprirsi soltanto in una stanza perfettamente buja o dove regni una luce rossa.

*Norwegian*.—Fölsomme fotografiske Plader, som fuldstændig fordærvet ved at udsættes for Lyset. Bør kun aabnes i et aldeles mørkt Rum eller ved rødt Lys.

*Swedish*.—Sjuskänsliga fotografiska plåtar, blifva förstörda om de utsättas för ljus. Fås därför ej öppnas utom i ett absolut mörkt rum.

*Modern Greek*.—Ἐνάλθηται πλάκες διὰ φωτογραφελαν αἰτρες διαφθέρονται εἰν ἀνοιχθῶσιν εἰς το φῶς της ἡμερας. Ὁφέλονται να ἀνοιχθῶσιν εἰς δωμάτιον σκοτεινὸν ἢ με φῶς ἐρυθρῶν.

*Turkish*.—بوسدق نورونه بولنان قوطيلارى نى فوتوغراف جاملى حس اولمخه ايد نيله چتاريلخه بوزولغر اولد بفرق قوطيلرك اصلاخا كورمز برغر اكلق اولد دى قرمزى جاملى درفانار ايله اجلوب معاينه ايتدير لمسى و بوجاملرك ايد نيله چتار لمسى التماس اولنور

*Arabic*.—شيشه هاى عكاسى اكر ورجاب اوشنى باز بشوز بگ خراب وبصرن خرا هشد برباير باكمال اخياط وراطق تاريخى بازكرده و باروشائى قرنراتمان كانشد

*Russian*.—Чувствительныя Фотографическяя пластинки которыя будут совершенно испорчены, если открыты ихъ при обыкновенномъ свѣтѣ. Онѣ могутъ быть открыты только или въ совершенно темной комнатѣ или а при освещеніи краснымъ саттвомъ.

**Photographic Society of Great Britain.**—There is on view at the Society's rooms, 50, Great Russell Street, W.C., a collection of prints in colours illustrative of the application of photography to chromolithography, chromo-typography, chromo-collotype, and chromo-photogravure. The exhibition will be open daily to the end of June between 2 and 9 p.m. Admission on presentation of visiting card.

**Royal Naval Exhibition.**—It may interest those of our readers who propose to visit this exhibition, to know that there is a stall there on which are displayed a number of photographs entirely the work of officers in the Royal Navy, some very fine pictures being amongst them. The photographs are for sale, the proceeds being for charitable purposes.

**"My Photographer."**—Mr. John Piggott, of Cheapside, is moving with the times, and has taken measures for the enlargement of his premises, so that he can add a photographic department to the already extensive list. Mr. Piggott goes on absolute cash principles, and so can sell at the lowest possible prices. For instance, he sells quarter-plates at 11½d. a dozen, and other things in proportion. Those who know Mr. Piggott's business enterprise will not be surprised at this new development of it, and will probably send for one of his photographic catalogues before making their season's purchases.

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

A GOODLY number of members attended the first Saturday ramble of the Edinburgh Photographic Society on Saturday. The party left the Waverley station by the 2.10 p.m. train, and after a run of less than half-an-hour, through the beautiful undulating country to the west of Edinburgh, and across the Forth Bridge, they alighted on the outskirts of the ancient town of Inverkeithing. The day was bitterly cold, with sometimes a shower of snow, and there was a teasing north-easterly breeze, which were serious disadvantages, but, on the other hand, the air was remarkably clear. Those, therefore, who had the good fortune to get an exposure free from moving foliage, had an opportunity for producing good work. The favourite exposures were at first within the burgh, on the quaint old church, the rather plain-looking tron-house, and the Cross, and afterwards, on going further afield, the harbour and bay, Rosyth Castle, St. Margaret's Hope, which is the usual anchorage in easterly storms, etc. The quality of the work which was done will not be shown publicly till November.

The Edinburgh University Photographic Society, which I mentioned last week, had a very entertaining meeting on Monday night, under the presidency of the versatile Dr. Drinkwater. Mr. Wm. Hume, Lothian Street, put himself to great trouble in preparing for his communication on enlargements and enlarging, but he had the satisfaction of securing the attention of a most intelligent audience. His remarks were illustrated by his own Cantilever enlarging apparatus, the easy manipulation of which he was able to demonstrate to perfection. In focussing, the apparatus not only can be moved to or away from the object, but there is a double movement on the apparatus itself, the bellows in front and the lamp behind being both moveable in the simplest manner. Besides, the whole apparatus lifts away, piece by piece, and thus every part is accessible for cleaning or repairing. Mr. Hume showed how to focus both by moving the apparatus and by moving the lens or lamp, and he also showed how by taking away the lens the apparatus was suitable for the illustration of medical and surgical specimens in lectures, thereby better acquainting the hearers with the subjects under discussion, and saving the lecturer from much blackboard or diagram work. Regarding the construction of the lamp, Mr. Hume said he found that two or three wick lamps with the wicks edge on, gave unequal illumination, and he always worked with the flame of the lamp flat on. He showed a number of enlarged photographs by himself, all of which were greatly admired. The vote of thanks which was accorded to him at the close, on the motion of the Chairman, was thoroughly deserved. It was arranged that the next meeting of the Society would be held on the second Monday in June, and that there should be competitions at the next two meetings, the first to be on "Micro-Photography and Grouping," or a picture to represent "There's many a slip between the cup and the lip," and the second upon portraiture or architecture, or a medical or surgical subject.

A series of forty-eight photographs of 16 by 14 size, illustrative of the Forth Bridge, from its commencement till its completion, has been placed in the Edinburgh Museum of Science and Art. As many of your readers may be desirous of photographing the bridge, it may be useful to them to know that it can be best "fielded" from a pathway on the high ground to the west of the railway station at South Queensferry. From there it is an afternoon view. A late afternoon view of it can be got on the north side of the Firth, from high ground above the public road leading to Inverkeithing, but the ground is kept private, and photographers might be disturbed in it. Almost any other situation than these two give either only a portion of the bridge, or show it too much end on to be useful as a picture. There are many points from which portions may be photographed, such as the shore at South Queensferry, the railway pier at North Queensferry, or the pier at Port Edgar for a distant view. If a picture of the wonderful interlacing of the steelwork is desired, there is no better place than right under the structure at North Queensferry, unless permission were granted to go on the bridge itself, which is somewhat difficult, and indeed is practically impossible, for tourists to get.

**Peterborough.**—At the monthly meeting on the 11th inst., Mr. Marsh read a paper on "The Photographic Lens, and How to Test it," illustrating it by different makes of lenses, and by diagrams on the blackboard.

## Apparatus.

### CUSWORTH'S "REPEATER" HAND-CAMERA.

THIS is one of the simplest hand-cameras in the market, and as, beyond the plates, there are practically only two moveable parts,

it is next to impossible for it to get out of order. The usual form is made of ebonised wood, looking neat and effective, and carries twelve quarter-plates, which are held by elastic bands to thin wooden carriers, and then put into the camera close together, there being no grooves or things of that sort for them to be put into. There is the end of a lever

slightly projecting from the front of the camera, and by moving this across from one side to the other the plates are changed and the shutter set at the same time, the consequence being that if the lever has not been moved and plate changed the shutter will not act. The shutter is released by touching a trigger at the side. The lens is of fixed focus, and is provided with rotating stops, easily manipulated from the front of the camera, which, when charged with plates, weighs less than four pounds.

### THE "TENSION" HAND-CAMERA.

Mr. Carter, of 15, Gerrard Street, Warwick, has sent us for examination one of these cameras, which he assures us is entirely his own work, and he can, therefore, guarantee that it is well made. The camera consists of a double chamber, the exposure taking place in the top one, and the plate, after exposure, is allowed to slide further down its own groove to the bottom chamber. There being one continuous groove for each plate, there is no chance of a sheath sticking. The reservoir, which contains twelve quarter-plates, is easily charged, and the whole arrangement is extremely simple. The finder is a peculiar one, and consists of a convex mirror which falls just in front of the lens, and a plane reflector, so that the centre of the picture comes absolutely in the centre of the reflector. An R.R. lens is fitted to a revolving plate, so that its position can be changed; and there is also an arrangement for focussing. The shutter works behind the lens, giving longer exposure to the foreground than to the sky. Altogether the camera is one to meet the requirements of the average hand-camera photographer.

## Quarterly Examinations in Photography.

**Question 17.**—Define the word "amateur" as applied to photographers, and state clearly your views on the subject. (300 words allowed.)

**ANSWER.**—The word amateur is derived from the Latin *amator*, a lover. An amateur photographer is a person who practises photography for love and not for money.

So far it is all plain sailing, but very soon difficulties appear. A man may not be a professional photographer, yet temptations may arise to make something out of his work.

Friends, who have perhaps been his companions on a tour, wish to have prints from his negatives and to pay for them. He gets a successful portrait of a friend, and is asked to sell the prints. A friend wants a house or a dog or a horse photographed, and begs to be allowed to pay expenses. A good deal is to be said on both sides in answer to the question, "Does a man forfeit his right to be called an amateur who accepts any one of these and similar offers?"

My own judgment, however, is, the amateur had much better let alone. He may have three motives for doing what he is

asked. It may be interesting work, or he may be willing to do uninteresting work out of friendship, or he may be willing to do it for money. In either of the first two cases he is an amateur, a lover of photography or a lover of his friend. In the last he is a lover of neither.

If a friend wants prints, lend him the negative, and let him give the job to a professional; if he wants work done, do it for love of the art or for love of your friend, or leave it undone. One thing should, I think, be permitted. An amateur should be allowed to sell work *bona fide* done for other purposes than for sale. Prints at an exhibition, negatives, which have been taken for pleasure, he should be allowed to sell if he gets an offer for them. The whole things lies in the object of work. A man is an amateur who works for the pleasure of the work. He ceases to be one the moment he works for profit.

R. C. M.

**Question 18.**—Forward a short article upon some "holiday resort," complying as far as possible with the rules laid down in "Our Views," p. 110, May 1st, 1891. (350 words allowed.)

**ANSWER.**—I can imagine no more perfectly delightful place in which to spend a few days than Iona. It is easily got at when once you are in Scotland, as Macbrayne's steamers go every day from Oban, the return fare being 17s. There are two hotels, the "St. Columba" and the "Argyle Arms," both fairly comfortable. There is almost every variety of interest on the island. First, of course, in importance are the architectural subjects. Of the cathedral I have fifteen negatives, all of very great interest. A rather short-focus lens will be useful for the interiors and for some of the exterior subjects. You will find something to do at any time of day. The doorway of St. Oran's chapel is, perhaps, the best architectural subject on the island, and inside this, as well as in the nunnery, is a perfect mine of wealth in tombstones, many of them beautifully carved. The two crosses are most curious, and the nunnery will yield many studies.

The people are, like most Highlanders, picturesque, and there are some highland cattle on the island. At Columba's Bay, about two miles off, I got some capital instantaneous shots of breaking waves, and the studies of rock and water are endless. I used my bedroom as a dark-room. There were fairly effective shutters. I had some difficulty in getting water to wash my negatives in, the island is so small there are no burns to speak of.

I spent five days there, but we did not make any expeditions to Mull or to Staffa, which is within reach by boat on a fine day. I believe one could spend a fortnight there very pleasantly. Our hotel bill came to about 9s. a day, but I fancy a much cheaper arrangement could be made, and lodgings can be got for a prolonged stay. It is impossible to see Iona properly in the hour the steamer gives, two or three days are necessary to see the place at all thoroughly.

R. C. M.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Birkenhead.**—The usual monthly meeting of this association was held on the 14th inst., Vice-President G. A. Carruthers occupying the chair. There was a large attendance. Messrs. T. Ferns, John Hardnup, and E. White were unanimously elected members of the association. A long and exceedingly interesting letter from the President of the association (Mr. G. E. Thompson), who is at present on a photographic tour among the Italian lakes, was read. The Secretary had placed in his hands for exhibition several new inventions. An announcement was made with respect to the annual competitions of the current year, it being stated that the annual outdoor competition would be held at Storeton Quarries and Brimstage on Saturday, 27th June.

**Blackburn.**—The first excursion of the summer season took place on the 7th inst. to Fleetwood. There was not a very large attendance of members, as the weather was not very promising at starting, but afterwards improved. Many plates were exposed with varying success on the many interesting objects to be seen—fishermen, boats, sailors, etc.—and a very pleasant afternoon was spent.

**Bradford.**—The monthly meeting was held on the 15th inst. at the society's rooms in Tyrel Street, the President (the Rev. T. Mellorey) being in the chair. Mr. Walter Leach, F.C.S., gave an interesting paper on "The Scientific Relation between Exposure and Development of Photographic Negatives, with a Description of Actinometers for Calculating Exposures," dealing in a large measure with the recent theories put forward by Messrs. Hurter and Driffild

on exposure and development. After a short discussion, a hearty vote of thanks was accorded to Mr. Leach for his instructive paper. Various descriptions of actinometers were shown, as were also a Caldwell shutter, by Mr. I. Sonnenthal, and a new hand-camera, designed by Mr. Leach and made by Mr. C. Grayson, of Bradford, which was much admired for its compactness and lightness.

**Bolton.**—The ordinary meeting was held on the 15th inst., Mr. E. N. Ashworth in the chair. The 1890 Prize Slides of the AMATEUR PHOTOGRAPHER were exhibited by Mr. Banks and the Hon. Secretary. The slides of Mr. J. E. Austen received well merited applause, as did those of Mr. Watson, showing the marble staircase of the new municipal buildings, Glasgow.

**Cambridge.**—The monthly meeting was held at 7½, Jesus Lane. The attendance of members was good. A large selection of prints were on view for study and criticism, kindly lent by the Editor of the AMATEUR PHOTOGRAPHER. A paper was read by Mr. F. H. Sanderson, on "Photographic Apparatus." A vote of thanks having been passed to the Editor for loan of prints, and to Mr. Sanderson for his paper, the meeting terminated.

**Croydon Micro.**—At an extra lantern evening on the 15th inst., Mr. Edward Lovett, President, in the Chair, Mr. J. A. Sinclair, of the Liverpool Amateur Photographic Association, gave an illustrated lecture entitled "A Scamper across Normandy with the Camera." Mr. Sinclair started his tour (in company with two friends) from Liverpool to London, and from thence to Dieppe, Rouen, Caudebec Pont Audemer, Lisieux, Falaise, Caen, Bayeux, St. Lo, Coutances, Mont St. Michel, and from thence home. Mr. Sinclair interspersed, his lecture with highly interesting, curious, and laughable incidents that occurred during his travels. The pictures were taken on Ilford ordinary plates, and the fine interiors of the French cathedrals that Mr. Sinclair had taken were particularly noticeable for their freedom from halation, and the whole series of pictures illustrating the lecture were of the highest technical excellence; the final picture of the evening, entitled, "A Farewell to Normandy and the Seine," a sunset picture, was worthy of special notice. On Saturday May 23rd there will be a half-day excursion to Groombridge, conducted by Mr. J. A. Carter.

**Glenalmond.**—The second meeting of the Midsummer term took place on the 16th inst, the President (Mr. A. S. Reid) in the chair. The President gave a lecture on "The Development of Instantaneous Photographs by a Mixture of Hydroquinone and Eikonogen," showing some prints, the negatives of which were developed by that mixture. Mr. R. Johnstone also showed some prints, one of which was a photograph of the club taken at the end of the Easter term by himself. The meeting adjourned at 9 p.m. till Saturday, May 30th. At the previous meeting the officers for the term were elected thus: President, Mr. A. S. Reid, M.A., F.G.S.; Hon. Secretary, Mr. E. H. C. Craig; Hon. Treasurer, Mr. J. H. Maxwell; Keeper of books, Mr. W. H. Maxwell; Keeper of the album, Mr. W. G. Harrison. About five new members were elected.

**Guildford.**—On the 12th inst., at the ordinary monthly meeting, Mr. A. E. Moon read a paper on "Impurities in Chemicals used in Photography, and how to Detect them." He illustrated his remarks by means of the optical lantern and chemical tank, showing on the screen the changes produced by various chemicals in the presence of foreign matter. The paper proved very interesting and instructive, and a good proportion of the members attended.

**Hackney.**—The annual general meeting was held on the 14th inst. Mr. Walter Wesson presided. The following gentlemen were elected for the ensuing twelve months:—President, Dr. Roland Smith; Vice-Presidents, Dr. Ambrose Kibbler, Messrs. J. Hubert, Frank Jolly, and J. A. Sinclair (the latter gentleman was formerly of the Liverpool Society); Treasurer, J. O. Grant; Curator, S. H. Barton; Council, W. L. Barker, H. J. Beasley, Walter Wesson, A. Dean, F. Houghton, C. F. Hodges. Mr. Fenton Jones (6, Victoria Street, Hackney) was re-elected Hon. Secretary. The report (third year) was a very satisfactory one, and progress is being made. The Hon. Secretary read a short paper on the different developers now used, and preferred, for pyro development, Wratten's, Lange's, and one by the President, in which a saturated solution of sulphite of soda was used. The best quinol formulæ, he thought, were the Ilford and one given by Mr. McCormack, and eikonogen that of Warnerke's. A lively discussion ensued, in which Messrs. Gosling, Reynolds, Gilbert, Dean, and others took part.

**Holborn.**—The monthly instruction to beginners night of the Holborn Camera Club was held on the 15th inst., Mr. R. Luxton in the chair. Mr. A. J. Golding first demonstrated on the platinotype process. In the course of his remarks on the process, he said it would recommend itself to all amateurs for its simplicity and also for its permanence. He developed, by the hot-bath process, six prints which he brought up with him, all turning out successfully, although had the bath been of a slightly lower temperature, perhaps better results would have been obtained. Mr. G. H. Bayston then demonstrated on bromide paper prints from the same negatives as Mr. Golding had used for his platinotype prints. Using the hydro-

quinone developer, he obtained some excellent results. Taken on the whole, the evening was a very instructive one, and very satisfactory to the members who had attended the meeting. Before the meeting separated, the Secretary read a circular letter *re* Mr. Biden's proposed federation of societies scheme, and it was decided that, as it was understood that the Photographic Society of Great Britain had also a scheme in hand, it was desirable to wait and see if the Photographic Society of Great Britain's scheme came to anything, most of the members being of the opinion that two federated societies would end in downfall of both.

**Jersey.**—At the monthly meeting at St. Heliers, on May 12th, the principal feature was the reading of a paper by the President, Capt. T. Lamb, on "A Tour with a Hand-Camera," in which the author related his experiences with one of these instruments during a recent trip on the Continent, and illustrated his paper by specimens of the work that had been done. He expressed his opinion that every amateur should possess a hand-camera, in addition to his larger apparatus, and as those who had not yet had experience of their use were apt to be bewildered by the variety in the market, he stated briefly what he considered to be the requirements of a hand-camera. The lens, he said, must be rapid (working at least at  $f/8$ ), and if only one lens can be used in the camera, the focus should be about  $2\frac{1}{2}$  ins. His own camera has two lenses—an RR. of 6 in. focus, which was used for all snap shots, and a 4 in. rectilinear for time exposures, which has the advantage of a wider angle of view. Captain Lamb found the 4 in. lens to be the most generally useful for time exposures. In a hand-camera the shutter is an especially important part, it being more than ever necessary that it does not shake; and it should be capable of giving any exposure, from 1 sec. to the hundredth part of a second. The best kind is one that works between the lenses, opening from and closing to the centre; but it is expensive. The next best is the Thornton-Pickard or roller-blind principle. For Continental travelling, glass plates are out of the question, owing to their weight; he used celluloid films, and found Desiré England's (ordinary rapidity) to be the best. Developers are, of course, much a matter of taste; but Captain Lamb always uses pyro for negatives, and hydroquinone for transparencies. Hyposulphite can be got anywhere. In the course of the lecture a number of lantern slides were exhibited, some to show the difficulties of architectural subjects; others of a detective character, showing people photographed without their knowing it; others of Eastern Alps; others of streets, canals, moving objects, with a slow exposure of about a quarter of a second; besides many other matters of interest.

**Paisley.**—The members held their first outdoor excursion of the season on the 16th inst., when a large party visited West Kilbride. The old castles of Portincross, Law, and Crossbie were photographed by some of the members, while others gave attention to the glen and views of the beach at Seamill.

**Sydenham.**—An ordinary meeting was held on the 12th inst., the President (Mr. C. D. Budd) in the chair. Mr. L. Wiltshire read a long and exhaustive paper on "Silver Printing." Having described the method of preparing the paper, various sensitising formulæ were given and several practical suggestions made, which will, no doubt, be found of great use to the members of this club. A long discussion followed, in which part was taken by the President and other ex-workers of the old wet-plate process.

**The Phot. Soc.**—At the meeting held on the 12th inst., Mr. J. Glaisher, F.R.S., President, in the chair, Messrs. L. S. Bruce, H. Holiday, and O. E. Pearce were elected members of the Society. A paper by Mons. Leon Vidal on "Photographic Methods of Obtaining Polychromatic Impressions," was read by the Assistant Secretary. In this paper the author described simple and composite photochromy. In simple photochromy a negative of the subject is taken on an orthochromatic plate, a collotype plate is prepared from it, and transfers laid on as many stones as there are colours required. The stones are worked by a lithographic artist, and printed in the usual way; to complete the picture, a collotype impression is printed over the colours. In composite photochromy three or more negatives are taken through suitable colour screens; these are retouched if necessary, made into collotype plates, and printed in the usual way. The paper was illustrated by lantern slides and specimens. The Assistant Secretary had got together numerous examples of photochromatic work which were hung upon the walls. Mr. J. Spiller, referring to the collection, said that they proved the great advance that had recently been made in reproductions in colour, especially referring to three examples by Hanfstangel, of Munich, and to a series of Swiss views by the Photochrome Co., of Zurich. Mr. G. L. Addenbrooke urged that the discussion should be adjourned till the members had had an opportunity of studying the paper and the exhibits. Mr. V. Blanchard said that Mr. Woodbury was the discoverer of the process described by M. Vidal. Dr. E. Albert mentioned that he had applied composite photochromy to type blocks. Votes of thanks to M. Vidal and the exhibitors terminated the proceedings, the discussion standing adjourned.

**Wolverhampton.**—The monthly meeting was held on the 12th inst. This is the first general meeting the society have held in their new quarters, which seemed to give general satisfaction to the members present, the large room being admirably adapted to lantern exhibitions and the hanging of pictures. It is hoped that in a short time extra accommodation in the shape of a dark-room, etc., will be provided. The last lantern lecture of the season was given by Mr. I. Meachem, the subject being "Mining Photography." After explaining the many difficulties experienced in this branch of photographic work, viz., the total absence of light reflecting surface, the very confined situations, and the great difficulty of keeping the lenses free from condensation, he stated that most pictures of miners at work were nothing like what they were supposed to represent, and that photography was here of great service in securing a faithful representation of this industry. He illustrated his remarks by

showing a series of photographs (with the aid of the optical lantern) of the different workings of a coal mine and the miners at work. The lecturer concluded by giving a general invitation to the society to visit the mines under his control, and photograph the various stages in the manufacture of iron, from the mine to the finished product. The "Itakit" detective camera was handed round by Mr. J. W. Evans for inspection.

**Wakefield.**—The second monthly meeting was held on the 12th inst. in the Market Cocoa Tavern. The President, Mr. A. Stanfield, J.P., delivered his inaugural address, and tendered advice on the choice of apparatus, printing process, etc., and also entered upon the composition of pictures, illustrating his remarks by prints made by himself, etc. Mr. H. Chaplin showed Pearson and Denham's lantern slide camera, and other members brought negatives, prints, and apparatus.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

## QUERIES.

4690. **Omnigraph.**—Can any reader recommend Lancaster's Omnigraph hand-camera, or any other at the same price and of equal simplicity?—**OMNIGRAPHIST.**

4691. **Toning Bath.**—Which is the best bath for black tones? What I require is a greyish black. How can I get it without keeping print too long in bath and thereby making it faint?—**C'EST MOI.**

4692. **Optimus Magazine Camera.**—(1) What is the best way for charging? My sight is not very good, and I find difficulty in placing in proper grooves with a red light. (2) Is there any lamp with yellow glass which can be used for this purpose without fogging the plates? I use Ilford ordinary plates, but they frequently catch in the grooves owing to being too thick.—**C'EST MOI.**

4693. **Covering for Hand-Camera.**—Having made a hand-camera, I wish to cover it with black leather similar to Kodak and many others. Where can the material be obtained? How is it applied, and are any instruments necessary? Is the process difficult to manage?—**J. W. W.**

4694. **Stained Negative.**—Can any kind amateur inform me how to eradicate a reddish stain which covers the whole of a negative? The stain made its appearance during intensification.—**W. B. P.**

4695. **Lens.**—Is there any difference between Dallmeyer's and Ross's rapid rectilinear? Will the former's 8 by 5 R.R. cover a  $\frac{7}{8}$  by 5 group, as in his catalogue it says, size of group 5 by 4 with the 8 by 5 lens?—**PENALLY.**

4696. **Antwerp.**—I am thinking of going to Antwerp for a day or two. Can any one who has been tell me of a comfortable house or cheap hotel, as I cannot afford much? Can I do it with the English language, as I know no other. I should go to Van Neck's to change plates, etc. Shall be pleased of a hint or two about money, the customs, etc. Any information will oblige.—**A RATHER NERVOUS ONE.**

4697. **Views, Where to Get.**—Would any one kindly give me a list of places (within three-quarters of an hour by rail of London) where it is possible to get four or six half-plate views without walking over four or five miles respectively?—**N. M. H.**

4698. **Barnet Plate, Rapidity of.**—Elliot's Barnet plate: Can any one kindly tell me the relative

rapidity of this plate to the Ilford ordinary, also a good hydroquinone developer for same?—**N. M. H.**  
4699. **Carbutt's Orthochromatic Films.**—Can any reader who has had practical experience of Carbutt's orthochromatic celluloid films tell me what is the difference between them and Edwards' isochromatic plates in the power of giving correct colour values? Also are Carbutt's films as thickly-coated and of as good quality as Edwards' plates?—**A. H. W.**

4700. **Pickard's Exposure Meter.**—Can any one recommend me Pickard's exposure meter, and also a good brand of plates that work well with the exposures indicated by it?—**IN DOUBT.**

4701. **Shutter.**—What is the longest exposure that can be given with Lancaster's quarter-plate 1891 Instantograph shutter, as supplied with camera?—**S. M.**

4702. **Focal Length.**—What is the focal length of Lancaster's quarter-plate Instantograph lens (1891)?—**S. M.**

4703. **Developer, Eikonogen.**—Would any reader of experience kindly give reliable formula suitable for bromide enlargements up to 12 by 10, and also one for instantaneous and ordinary plates?—**SCOTIA.**

4704. **Channel Islands.**—Being desirous of visiting these islands during August, I shall be glad of any information such as places to make headquarters to work from, places to visit, list of dark-rooms at disposal, also is there any trouble with the customs in returning, quality of light as compared with Cheshire?—**S. L. COULTHURST.**

4705. **Shropshire.**—I shall be spending a few days in Shropshire during the summer, and shall be glad of any information relating to points of interest for the camera, especially in the neighbourhood of Much Wenlock and Hughley, the latter of which places will be my head-quarters.—**F. B.**

4706. **Permission to Photograph.**—I shall be greatly obliged if any amateur photographer who has been in any of the following parks, gardens, etc., viz., Hyde Park, Richmond Park, Battersea Park, Victoria Park, St. James's Park, Regent's Park, Kensington Gardens, Kippington Forest, and any other parks or gardens there may be in or near London, could inform me which are the best parts and how many plates (half-plate) could I expose in an afternoon, making a choice selection in each park or garden, going through, say, two every afternoon? Also which and where are the best entrances, and how can I obtain a license for the purpose of taking photographic views in Kew Gardens?—**W. H. ELLIS.**

4707. **Lewis, Island of.**—I purpose taking my camera to the Island of Lewis (Hebrides), and should be glad if you or your readers would kindly tell me if I could get any photographic materials in that outlying place, or would I have to take everything with me? I want to make a series of prints on the spot, so that I will have to develop my plates from day to day. Would it be well to take films and a printing-out paper that gives the least trouble?—**Q.**

## QUERIES UNANSWERED.

April 24.—No. 4638.  
May 1.—Nos. 4647, 4648, 4653, 4654, 4655, 4657, 4658, 4659.  
" 8.—Nos. 4668, 4671, 4674, 4675.  
" 15.—Nos. 4679, 4680, 4682, 4683, 4684, 4686, 4688.

## ANSWERS.

4665. **Pompeian Blue.**—"Quis" will find what he wants on p. 88 of the **AMATEUR PHOTOGRAPHER** for February 7th, 1890, No. 279, vol. xi.—**NIEPCE.**

4667. **Testing Shutters.**—Will "H. Leach" kindly give an instance of the "simple mathematical calculation"?—**PHONE.**

4681. **Snap-Shot Developer.**—The word grams is a printer's error, and should be grains. As to how to make Solution B, the simplest way is to put a quantity of common washing soda in a bottle, pour over it some warm water, taking care always to leave some undissolved soda in the bottom; you then always have a saturated solution. To use as developer, take one part of A to seven of B. If more density is required, add more of A.—**F. YOUNG.**

4685. **Llandrindod.**—Llandrindod has plenty of

good hotels, whose tariffs are very reasonable. Plenty of snap-shots may be had there, but the chief things to be taken are the waters. Trefriw is the place for tit-bits, where anybody with an eye for beauty can fill any amount of plates. The beautiful woods of Gwydir Castle, the old church, lakes and bridges galore, enough to satisfy the plate capacity of any reasonable amateur.—**SLIP.**

4687. **Reliable Half-Plate Camera.**—"K. M. W." could not do better than get the British camera, made by Mr. Chapman, of Manchester. It has every movement, and is strong and reliable in every way. The price is £5.—**SCOTIA.**

4689. **Toning Aristotype.**—I have used with complete success the formula given in the printed instructions for Aristotype paper for fixing and toning in one operation. The process is thereby conducted with a minimum of trouble. The only point to remember is that the print must be several shades darker than it is intended to appear when finished.—**DUPLEX.**

4689. **Toning Aristotype.**—The following appeared in the "Amateur Photographer's Annual" 1891:—Print deeply, and immerse without washing, in the following bath, which may be used at once, and will keep fairly well:—

Hypo	...	...	240 gr.
Ammonium sulphocyanide	...	...	50 "
Acetate of soda	...	...	15 "
Chloride of gold	...	...	2 "
Water	...	...	3 oz.

Prints will at first turn a sickly yellow, but will gradually assume a brown tone, then purple, and, finally, a warm black. Rinse, and give five minutes in a 5 per cent. solution of alum, then wash well as usual. The above tones and fixes at the same time.—**S. M.**

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us **BEFORE TUESDAY MORNING'S POST** if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—**ED. AM. PHOT.**

**R. GRINDLE.**—We gently breathed on your sample of paper and placed it under a negative of ordinary density and exposed it in the sun; we obtained a distinct impression in half a minute and a fairly strongly printed-out image in four minutes, which was quite dense enough when washed in the acid bath. Your paper is too dry; expose the sheets to a damp atmosphere for a short time before exposing to light.

**A. W. OOK.**—The following is the formula you want:

Chloride of gold	...	...	4 gr.
Uranium nitrate	...	...	4 "
Salt	...	...	60 "
Sodium acetate	...	...	60 "
Distilled water	...	...	32 oz.

Disolve the gold and uranium in a little water, neutralise by adding carbonate of soda, then add the other ingredients previously dissolved. Print, deep; wash the prints free from silver before toning.

**Geo. E. BRYANT.**—Your name is entered, but you were too late to receive the exposed plate. We forward you one, however, now.

**A. P. G. D.**—We hope to forward it in a week or so; it has not yet arrived from the engraver.

**H. J. KNIGHT.**—Thanks for article and letter; the former we shall have much pleasure in using, and we will keep the latter before us.

**W. B. LONG.**—We should say that No. 2 would be decidedly the better of the two for the purpose, and as to the second part of the question we should recommend C. We are afraid we cannot oblige you with any hints on exposure for that particular place, but remember to expose for the shadows.

**S. A. SMITHERS.**—The lantern is a good one at the price; you could use the front lens for the purpose you mention; we should prefer it to the cheaper one.

E. K. DENHAM.—The Holiday Tour Competition was this year represented by the "Holidays with the Camera" Competition, and there is another, "Photography at Home," the prints for which must be sent in by the 30th June.

P. R. S.—Thanks for the article, which we will use in the near future.

S. L. COULTHURST.—It will be sent in the course of a day or two.

S. G.—The lantern is very good at the price, and has done good work of the kind you mention. Any of the bromide papers are good; probably the rapid would be best for your purpose. The ordinary borax toning bath will answer for the paper:

Borax	...	...	...	20 gr.
Gold	...	...	...	1 "
Water	...	...	...	8 oz.

Either developer will do for bromide paper.

A. V. DYER.—Your best plan would be to ask in our Query columns; there was an offer some few weeks ago which may help you.

OLD HAND.—(1) For magazines try Lancaster's Rover, for dark slides Loman's Reflex. (2) For films the Kodak.

## Quarterly Examinations in Photography.

### QUESTIONS.

- Forward a bromide print from the negative you have in your possession (Question 16), and tone the print to a brown colour, giving full details of the method of procedure.
- What is the cause of (a) want of vigour, (b) mealy prints, (c) white marbly marks, (d) black marbly marks, (e) black specks in albumen print?
- How would you set to work to reproduce an oil painting, the colours of which have to be, as far as possible, correctly rendered? What light would you employ: sunlight, diffused light, or lamplight?

(Latest Day for Answers—June 1st.)

### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.
- All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
- A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.
- Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.
- Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed to:—  
"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Advertisements can be inserted under a number,

the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, from 166 to present date, 15s.; "Photography," 43 to 130, 4s. 6d.; vol. 1. "Reporter," 2s. 6d.; or offers exchange.—Avery, 45, Park Street, Dorset Square, London.

AMATEUR PHOTOGRAPHER, vol. 1. to date, bound, for sale, or exchange for 5/4 Casket single lenses; difference adjusted.—O. J. Leaper, 4, Chester Road, Dublin.

"Photographic Reporter" from the beginning, and AMATEUR PHOTOGRAPHER, complete for last five years, for exchange or sale, cheap.—T. Metcalfe, Cotswold House, Cirencester.

Cameras, etc.—Lancaster's 1889 half Instantograph, complete, excellent condition; 69s. 6d.; or offers.—Fred Fenwick, Jesmond Dene, Newcastle-on-Tyne.

Cameras, Lenses, etc.—For sale, the property of a private gentleman, all in good condition; offers requested; may be seen at Stanley's, 13, Railway Approach, London Bridge, S.E.: Whole-plate bellows camera, one single and three double backs, Dallmeyer lens 3D, 7½ by 4½ bellows camera, with one single and six double backs, one light sliding tripod stand, two plate boxes, 7½ by 4½, and six light-tight ditto, three 5 by 4 plate boxes and two light-tight ditto, one 3½ in. lantern condenser, also a quantity of dry plates and good apparatus for electrical experiments.

A half-plate Instantograph camera, two backs, tripod, and bag, price 30s.; or with rapid rectilinear lens, £4.—Ingham, 15, Seymour Grove, Old Trafford, Manchester.

Underwood's whole-plate Tourgraph, three double backs, lens, tripod, waterproof bag; £3 15s.; bargain; cost £6 5s. 6d.—Franklin, Castle Street, Shrewsbury.

Whole-plate camera and rapid rectilinear lens; cost £8 three months ago; will sell for £5 10s.—May, 4, Rosina Street, South Hackney.

Underwood's half-plate Instanto, double extension, reversing back, all movements, lens, stand, instantaneous shutter, view-finder, and extra front, capital condition, worth over 90s., sell for 60s.; also excellent cabinet portrait lens, 30s.; approval.—Drake, Amherst Villa, Polsoe Road, Ekeater.

Camera, 5 by 4 (Horne and Thornthwaite), magnificent portrait lens, slide, etc.; 40s.; bargain.—George Carter, 27, Albert Road, Peckham.

Lancaster's patent Instantograph 1891 camera, rapid rectilinear lens, double dark-slide, tripod, etc., complete, new; £3 10s. cash; worth nearly double.—Ramus, 27A, Farringdon Street, London, E.C. Letters only.

Bargains, must be cleared. Cyclists' camera, all movements, takes plates 3½ by 2½, can be used as hand-camera, with six double slides, almost new, cost 60s., price 25s.; splendid 5 by 4 rectilinear, also wide-angle, 17s. 6d. each; quarter-plate tripod, 4s.; Lancaster's folding ruby lamp, 2s. 6d.—T. Hall, Pinfold Lane, Lancaster.

Baroness camera, quarter-plate, most fairy-like instrument, every possible movement, new last autumn, perfect condition, fitted with Eastman's roll-holder, quite new, Beck's rapid rectilinear lens, Iris diaphragm, 4-fold stand and solid leather case; price £9 10s.; cost £13 10s.—W. Thomson, Laurel Bank, Halifax.

Lancaster's quarter-plate Instantograph, Wray's 5 by 4 rapid rectilinear lens, new, Kershaw's shutter, view-finder, stand, changing bag, etc.; 50s.—R. Ballard, St. Bartholomew's Hospital.

5 by 4 Optimum extra-rapid Ruryscope, 40s.; 5 by 4 camera, long-extension, leather bellows, fitted with three metal slides and carriers for quarter-plates, 32s. 6d.; portable dark-room, 15s.; strong ash stand, 7s. 6d.; background scene in oil, 10s.—O. W., 307, Great College Street, Camden Town, London.

Hand-Cameras, etc.—No. 4 Kodak, regular, nearly new; £8; or exchange stereo hand-camera, cash if necessary.—Dr. Fitton, Dewsbury.

Perken, Son, and Rayment's hand-camera, carrying 12 quarter-plates, extra-rapid Ruryscope lens, cost 8 guineas, nearly new; £5, case included.—On view at the AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Quarter-plate hand-camera, as new, Hethton Lewis pattern (by Turnbull), suits lenses of 5 and 9 in. focus, six double backs, cost £8 5s.; with Taylor's Iris diaphragm lens, five guineas; camera alone £3 10s.; lens alone, three guineas; approval; deposit.—S. E., 2, Wellington Terrace, Weston-super-Mare.

Lenses, etc.—Ross' portable symmetrical, No. 6, as new, 80s.; McKellen's 10 by 8 mid-angle R.R., 10 in. focus, grand instrument, as new, 60s.; approval with pleasure.—Avery, 45, Park Street, Dorset Square, London.

Splendid new cabinet portrait lens; cost £5; take 50s.; bargain.—T. W. Milburn, Battle Hill, Hexham, Northumberland.

I will exchange my quarter-plate portrait lens (by Dallmeyer, No. 2800) for good half-plate camera and two double slides, must be in good condition; or will sell the lens, with stops, for £3 10s.—J. Boulton, 5, Belmont Street, Rainbow Hill, Worcester.

Dallmeyer's No. 1 wide-angle landscape lens, patent, in perfect condition; price 55s.—J. E. Thornburn, Bothel Low Moor, Aspatia.

Dallmeyer's wide-angle landscape lens, 7½ by 4½, rotating stops, as new; £2 10s. Wanted, slides for Collins' or Stereoscopic Co.'s quarter-plate hand-camera.—A. Spiller, Hillside, Hampstead Hill Gardens, London, N.W.

Roll-Holder.—Eastman's quarter roll-holder, recent type, with about eight exposures; price 30s.; offers?—Telfer, King Henry's Road, Hampstead.

Sets.—A gentleman, prevented by illness from going abroad, will sell a Luzo apparatus, complete, quarter size, plates 4½ by 3½; the machine has never been used; it is perfectly new.—Apply, No. 159, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

On sale, quarter-plate outfit, comprising camera with all latest movements, one double slide, folding tripod, R.R. lens, and two porcelain dishes, condition new, only used twice, about to purchase larger size; will sacrifice lot for £3.—A. R., 45, Digby Road, Queen's Road, N.

Genuine bargain to any gentleman requiring a complete and first-class make outfit. Camera, 7½ by 5 (by Meagher), with extending front, rising and sliding ditto, with partition for stereos, reversing swing-back, and all the latest improvements, three double dark-slides, rapid rectilinear lens (by Taylor), extra strong tripod, all new last autumn; also the following sundries: quarter, half, and 7½ by 5 printing frames, paper mache and iron enamelled dishes, glass shapes, zinc vignettes, burnisher, background, measures, light-tight boxes, carriers, focussing piece, view-finder, and cases, condition guaranteed as new, in one lot, only £12; camera and slides alone cost £10 15s.—G. Sanders, 30, Seymour Street, Liverpool.

Shutters.—Underwood's half-plate Instantolux shutter, time and instantaneous; 11s.; good condition.—H. Gilbert, 52, Edgware Road, London.

Thornton-Pickard time and instantaneous shutter, 1¼ in. hood, preferred with regulating fan, cheap; approval.—Western, Clare, Cambridge.

Sundries.—Eastman film-holder, with about 40 exposures, whole-plate; cost about £5 10s.; half-price.—Major Pollock, Barracks, Glasgow.

Superfine black cloth Cambridge coat, new, 37 in. breast; 10s.; particulars sent.—Mrs. Brickland, West St. Helens, Abingdon.

Photograph, brass-fronted binocular lantern, with accessories, gas governor, induction coil, 2 in. spark, pair telephones, racer bicycle (Rudge), nearly new.—190, Heyside, Royton.

Silver water, patent lever chronograph, for half-plate R.R. lens by good maker; also half-plate camera wanted, with one or more dark-slides, for cash, must be cheap.—Alex. Gillies, Saw Mills, Kilmoreack by Baulry, Invernesshire.

Green's 14 in. lawn mower, perfect order; will exchange for approved photographic goods.—K., West House, Bishop Auckland.

Spring-frame Safety bicycle, Whippet (Linley and Biggs), ball head and pedals; luggage carrier, suitable for carrying camera, Lowne's cyclometer and lamp.—P. Cox, Hermitage, Harrow.

## WANTED.

Cameras, etc.—Half-plate tourist camera, Acme preferred, with stand and case, no lens; approval; cash.—Reynolds, Southover, Worthing.

Chadwick's stereo camera, 6½ by 4½.—State lowest cash price to Butterworth, Bank Street, Darwen.

Half-plate camera, with three double slides; lens, tripod, etc., immaterial; approval.—No. 160, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Modern stereoscopic camera, complete, Chadwick's 6½ by 4½ preferred, must be perfect and cheap.—Geo. Tittensor, 1, James Street, Hull Road, York.

Box or studio camera, with two dark-slides, to take whole-plate portrait lens, must be cheap.—Apply, Omega, The Cedars, Rickmansworth, Herts.

Half-plate camera and double dark-slide, without lens, second-hand, suitable for beginner, must be cheap.—Apply, stating price, J. Simpson, George Street, Coupar Angus, N.B.

Hand-Cameras, etc.—Swinden and Earp's 5 by 4 detective, or Adams'.—W. H. S., 26, Scarisbrick Street, Southampton.

Hand-camera, one of Swinden and Earp's, or Miller's Adelphi; no cards.—No. 161, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Kodak camera, cheap for cash.—Particulars of condition to B., 1, Dermody Road, Eastdown, Lewisham, S.E.

Lenses, etc.—Half-plate rectilinear lens, English preferred, good condition, cheap, cash.—118, Grimsythorpe Road, Sheffield.

7 by 5 and 9 by 7 Optimum R.R., or other good maker, cheap.—Avery, 45, Park Street, Dorset Square, London.

Wide-angle rectilinear lens, about 3 in. focus, good maker, cheap.—Hirst, Bishopthorpe Road, York.

Sets.—Instantograph quarter set, must be recent pattern, good order, and cheap; approval on deposit; state full particulars.—Photo, 20, Carey Terrace, Carey Road, Leytonstone, N.E.

## NOTICES TO SUBSCRIBERS.

*Subscriptions must be prepaid.*

UNITED KINGDOM.....	Six Months, 5s. 6d.....	Twelve Months, 10s. 10d.

**NOTE.**—To ensure insertion, all Communications should reach the Editor on Tuesday.

## PUBLIC SCHOOLS COMPETITION.

OPEN TO BOYS UNDER SEVENTEEN YEARS OF AGE.

- Class I. Landscape. "Amateur Photographer" Silver and Bronze Medals.  
 II. Portraits, Including Groups " " "  
 III. Animals " " "  
 IV. Architecture " " "

**NOTE.**—Entry forms now ready. Send stamped addressed envelope, endorsed "Competitions," The Editor, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, London, E.C.

Latest date, June 17th.

## Ladies' Second Photographic Competition

### PRIZES.

FIRST PRIZE. SECOND PRIZE. THIRD PRIZE.  
 GOLD MEDAL. SILVER MEDAL. BRONZE MEDAL.

(These Medals, of the smaller series, will be appropriately mounted as Brooches or Pendants if desired).

**SUBJECTS:** Landscape or Seascape—Landscape with Figure—Portraiture or Figure Study.

**NOTE.**—Entry forms now ready. Send stamped addressed envelope, endorsed "Competitions," The Editor, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, London, E.C. Latest date August 22nd.

## COMPETITION.

TWO GUINEAS are offered for each of the best series of 5 PHOTOGRAPHS BY AMATEURS illustrative of either of following places:—

Edinburgh, Dublin (and vicinity), Belfast, Irish Scenery, Glasgow (and Clyde), Bath, Brighton, Torquay, also of Still Life, *expropo*s of either, River, Sea, or Country.

Not more than two principal Architectural Views admissible, the other three to be typical scenes, artistically and unconventionally treated.

**SHARPNESS AND CLEARNESS OF OUTLINE REQUISITE.**

**COPIES NOT LATER THAN JULY 15 TO**

**AUTHOR,** care of HAZELL, WATSON, & VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON.

Advertiser reserves the right of publishing such as may be accepted. Those unaccepted returned.

**SOLD EVERYWHERE.**

**Bulky Developers superseded by POWELL'S PYRO "DEVELOPOIDS,"**

1s. a bottle, which may be carried in the waistcoat pocket. Will develop six dozen plates.

Invaluable when travelling and at all times.

**Sole Maker—**

**T. H. POWELL, 116, Denmark Hill, London, S.E.**

**Sole Agents—**

**MARION & Co., 22 & 23, Soho Square, London, W.**

**N.B.**—T. H. POWELL makes a speciality of preparing Photographic Developers with the purest Chemicals and recrystallised salts. Country Amateurs, please note.

**SECOND EDITION IN THE PRESS.**

**Amateur Photographer's ANNUAL.**  
 Paper Covers, 1s.; Cloth Boards, 1s. 6d.

A FEW COPIES ONLY OF THE CLOTH EDITION LEFT.

# THE "AMATEUR PHOTOGRAPHER" COMPETITIONS, 1891.

The Dates given below are those upon which the Competitors' work must actually be received.

JUNE	1	...	Monthly Photographic	...	...	...	VILLAGE LIFE, FARMING, ETC.
"	17	...	Public Schools	...	...	...	Particulars to be announced.
"	30	...	* Photography at Home	...	...	...	Particulars to be announced.
JULY	1	...	Monthly Photographic	...	...	...	OUT-OF-DOOR FIGURE SUBJECTS, GROUPS, ETC.

All prizes will be in the form of Medals from the "AMATEUR PHOTOGRAPHER'S" several dies. No prize winner will be allowed to compete again for a Medal of the same value as that awarded him. The "AMATEUR PHOTOGRAPHER" Monthly Competitions are for the encouragement of beginners and those who have never entered a competition or exhibited their work. In the competitions marked with an asterisk, special or "progressive" Medals will be offered for competition by past prize winners.

Further Particulars, Entry Forms, etc., will be sent on receipt of stamped envelope.

Address: THE EDITOR, "AMATEUR PHOTOGRAPHER,"

1, CREED LANE, LONDON, E.C.

**NOTE.**—ALL APPLICATIONS TO BE ENDORSED, "COMPETITIONS."

THE success of the AMATEUR PHOTOGRAPHER'S Annual has been far beyond our expectation, the whole of the first edition being practically sold out. A second edition is now ready, and we would advise every photographer going on tour to take the ANNUAL with him, as it contains hundreds of wrinkles and dodges which will be found in no other book, and which will be of exceptional service when away from home.

In the present number we commence the publication of "Holiday Resorts and Photographic Haunts," and shall be glad of short articles upon any places not included in the "Tourist Index." The articles that have already appeared have been of immense assistance to our readers, and we hope many are preparing contributions for our columns.

THE Secretaries of the Cardiff Photographic Society send us a letter, published in another column, asking us to draw attention to the special inducements offered by their committee at the forthcoming exhibition to photographic

societies in the competition, Class 15, for the "best collection of not less than 50 slides illustrating a town or district. Prize, an optical lantern, value ten guineas; the slides to be accompanied by a lecture written or printed on cardboard; the winning slides to become the property of the Society." In their letter the Secretaries state that this prize is offered as an incentive to societies to form collections of slides, and that although the slides are to become the property of the Cardiff Society, it is proposed to loan them under certain conditions.

We certainly think that photographic societies might do much more for one another than they do at present. Our experience of loaning slides has been that we are able to give instruction and pleasure to thousands of people. The interchange of lantern slides by societies is one of the great works to be done, and although we deprecate anything like a "reading," we think each slide shown should have a few words of explanation and description given with them in addition to the usual lectural information.

The Secretaries also wish us to notify that they have made an arrangement with the Committee of the Glasgow Exhibition by which exhibitors desirous of competing at both exhibitions may have their pictures sent from Cardiff to Glasgow by through truck, carriage paid, to arrive at Glasgow in time for the judging on August 31st. This will be a very great assistance to many intending exhibitors.

SOME of our readers will possibly have something to say relative to Mr. Gill's letter upon "Photographs of Celebrities." We publish it as requested, and will only add that oftentimes it becomes a public duty that the possessor of a photograph of a "celebrity" should allow the use of it for the public good.

WE are pleased to note that a new society has been formed at Llanelli, with the title of the Llanelli Amateur Photographic Society. The Hon. Secretary is Mr. John Daniell, Dovedale House, Coleshill, Llanelli.

MR. ALBERT B. GEE, Hon. Sec. of the Albany Institute Amateur Photographic Society, writes to say that the premises at 345, Albany Road, Camberwell, have been entirely rebuilt, and that, in addition to a fine meeting room, there is a commodious dark-room which is being fitted with all the necessary accessories. The room is open to members in the evening from 6.30 to 10 o'clock. The subscription for non-members of the Institute is seven shillings per

annum, and the meeting nights are alternate Thursday evenings, at 8 o'clock. There is a good list of papers carrying the meetings up to 1892, and the Society is thriving and energetic, and will be found very useful by beginners.

A WRITER ("G. M.") in the *Speaker* is very much down on the artists who use photography as an assistant in their work. He says—

"I pass on to consider rapidly—and, I must admit, only cursively—a matter less abstruse and of more practical interest—namely, the habit—and a habit which is increasing among artists—to avail themselves of the assistance of photographs in their work. It will not be questioned that many artists of repute do use photographs to—well, to put it briefly, to save themselves trouble, expense, and, in some cases, to supplement defective education. But the influence of photography on art is so vast a subject, so multiple, so intricate, that I may do no more here than lift the very outer fringe. It is, however, clear to almost everybody who has thought about art at all, that the ever-changing colour and form of clouds, the complex variety (definite in its very indefiniteness) of every populous street, the evanescent delicacy of line and aerial effect that the most common and prosaic suburb presents in certain lights, are the very enchantment and despair of the artist; and likewise everyone who has for any short while reflected seriously on the problem of artistic work must know that the success of every evocative rendering of the exquisite externality of crowded or empty street, of tumult or calm in cloud-land, is the fruit of daily and hourly observation—observation filtered through years of thought, and then fortified again in observation of Nature. But such observation is the labour of a life; and he who undertakes it must be prepared to see his skin brown and blister in the shine, and feel his flesh pain him with icy chills in the biting north wind. The great landscape painters suffered for the intolerable desire of Art; they were content to forego the life of drawing-rooms and clubs, and live solitary lives in unceasing communion with Art and Nature. But artists in these days are afraid of catching cold, and impatient of long and protracted studentship. Everything must be made easy, comfortable, and expeditious; and so it comes to pass that many an artist seeks assistance from the camera. A moment, and it is done; no wet feet, no tiresome sojourn in the country when town is full of merry festivities, and, above all, hardly any failure—that is to say, no failure that the ordinary public can detect, nor, indeed, any failure that the artist's conscience will not get used to in time."

After referring to Mr. Gregory, Mr. Bartlett, and Mr. Menpes, who, he says, all use photography, he winds up by saying—

"In certain moments a backyard, with its pump and a child leaning to drink, will furnish sufficient motive for an exquisite picture; the atmosphere of the evening hour will endow it with melancholy and tenderness. But the insinuating poetry of light the camera is powerless to reproduce, and it cannot be imagined; Nature is parsimonious of this her greatest gift, surrendering it slowly, and only to those who love her best, and whose hearts are pure of mercenary thought."

WE observe that the premises of Messrs. Lafayette and Co., the well known Dublin photographers, were on the 21st inst. destroyed by a fire, which broke out in the ground floor of the premises, occupied by a druggist. We fear that many valuable negatives of celebrated persons must have been involved in the general destruction.

THE Commission for making the arrangements for a photographic chart of the heavens is getting on with its work, and the probability is that the necessary apparatus to secure uniform results will soon be supplied to all the observatories interested. To enable observers to pass in a uniform manner from the ninth to the eleventh magnitude (Argelander), a commission has been appointed to supply screens of absolutely identical webbing to all the observatories, which screens will diminish the brilliancy of a star by two magnitudes. Forty minutes is the standard time for exposure of the negatives destined to be used for the charts, the mean atmospheric conditions of Paris, and plates prepared by the firm of Lumière being taken as bases. The

metallic screens will be distributed shortly, and the names of Captain Abney and M. Cornu have been added to the Committee appointed to settle the details of the photographic processes.

MR. W. WILSON MERCER writes to us that he is desirous of starting a photographic society for the South of Ireland. The idea is a good one and worthy of support. Those who are desirous of joining should communicate with that gentleman, at the Leamy School, Limerick, whence they can obtain full information.

MR. CORNEY GRAIN's new musical sketch, which was produced on Monday last, is likely to be one of the "hits" of the season. Before coming to the main theme—"Dinners and Dinners"—Mr. Grain alludes to the modern craze for amateur photography. "The kodak," he explains, "is an instrument of torture found in every country house. When you least expect it, you hear the dreadful click which is driving the world mad." Mr. Grain comically describes his adventures at various social festivities, such as a picnic or a ball, and follows each experience with the catching refrain of—

"The kodak! the kodak!  
It took then and there!  
The kodak! the kodak!  
It takes me everywhere!  
\* \* \* \* \*  
The kodak here, the kodak there,  
It nearly makes you sick,  
Wherever you be—on land or sea—  
You hear that awful click  
Of the amateur photographer,  
Click! click! click!"

THE question of using the lantern stereoscopically has been frequently discussed, but recently Mr. Scott, of Weston-super-Mare, has invented a process by which he claims to get a lantern picture thrown on the screen in the natural colours of the object from which it was photographed. He starts on the assumption that there are four primary colours—green, red, blue, and violet, and acting on that assumption he takes simultaneously four photographs on an orthochromatic plate of  $3\frac{1}{4}$  in. square, each picture occupying one-fourth of the whole plate. These four photographs are taken by four lenses, fastened together into a group, and between each lens and the sensitive plate Mr. Scott puts a colour screen representing his four primaries. The exposures are simultaneous, but in order to obviate the difficulty that would arise from the fact that some of the colour screens would stop more actinic light than others, the lens apertures are varied in size so as to give as nearly as possible equal exposures. The resulting photograph is developed in the ordinary way, and a transparency is made from it, which when examined by transmitted light looks to be merely four little photographs of the same object, there being very slight apparent difference between them. To use these photographs in the lantern the colour screens have again to be used, each picture being projected by its own lens through the same colour screen that was used in taking the photograph; the four lenses also point to the same place, at which they come to a focus, making one picture only. The result is very striking and extraordinary; kaleidoscopic confusion of colour falling into instant and beautiful harmony as register of the pictures is approached. The subjects shown were varied in character, including landscapes, sunsets, shop windows, and advertising hoardings. The skies, with light fleecy clouds in broad daylight, or heavy masses of brilliant colour in the sunrises, were beautifully shown, and the coloured posting bills on a hoarding,

as affording a means of analysing the effect of each colour screen, were even more interesting than the landscapes or the more important subjects.

### HOME PORTRAITURE.

THERE are two great classes of magnesium flash light, both of which can be used for home portraiture, the one with the use of a mixture of magnesium powder and an explosive, the other by the use of magnesium blown through the flame of some burning lamp, etc. The choice between these two varieties may be decided, first by the convenience of the operator, second by price, third by absence of the products of combustion, and fourth by the chemical activity of the light. The following, extracted from a table by Eder, will help to decide the last point :—

THE SOURCE OF LIGHT (at a distance of 1 metre).	DURATION OF ACTION OF LIGHT.	CHEMICAL ACTIVITY.
1. Amyl acetate lamp (taken as unit) .....	1 sec.	1
2. Lime light .....	1 "	260
3. Gas light (Argand burner) .....	1 "	28
4. Magnesium ribbon (2½ ins. = .03 grain)...	7 "	11,400
5. Magnesium powder (.03 grain blown through a flame) .....	½ "	18,200
6. Explosive mixture with 1.5 grains magnesium, 10 grains chlorate of potash, and 10 grains perchlorate.....	⅓ " "	19,200
7. Explosive mixture as above (23 grains)	⅓ " "	200,000
8. " " " (60 " )	⅓ " "	500,000

The amyl acetate lamp is taken as the standard, and, compared with our English standard of the normal candle, the amyl acetate lamp = 1, the English normal standard candle = 1.140.

From the above table it is obvious that an explosive mixture will give by far the greatest relative action, and this is in our power to control by the quantity we use; in fact, 23 grains of the mixture give as actinic a light as is obtained in a good studio on a fine day, and 60 grains gives more than twice as much light. With explosive mixtures there is, of course, always a danger, but this may be avoided by careful management. The separately powdered chemicals should be turned out on to a sheet of white paper, and then mixed with the hand or by the aid of a feather. The plain magnesium powder is more generally used now, we think, in England and also on the Continent, and, provided an intense and large flame surface is given, which should be chosen for its heat rather than its light-giving powers, it is possible to obtain very fine effects of lighting. There is, however, one important point which is too often forgotten, and that is that the relative activity of the light decreases as the square of the distance from the source of light, therefore if we place our sitter at a distance of three yards from the light we shall get considerably less illumination than at a distance of one yard.

The arrangement of the camera, sitter, and lights for flashlight work is shown in the following diagram. This is the arrangement adopted by Schirm, in his flashlight gallery at Berlin. The distance from the camera to the first flash lamp on the light side of sitter is from 1 to 1.5 metres, the distance from this lamp to the second lamp is 1 metre, the distance between these lamps and the sitter is from 2 to 2.5 metres for the first lamp and from 2 to 3 metres for the second, the distance between the camera and lamp on the shadow side is 1 metre, and the distance between this lamp and sitter from 2.5 to 3.5 metres. If necessary, a large white reflecting screen is placed on the shadow side of sitter. Each lamp is provided with an opaque screen on the side nearest the lens, so as to prevent any stray light entering the lens. All the lamps are con-

nected with one air-pump or indiarubber bellows, and are thus simultaneously fired, and about two grains of magnesium are projected through each flame.

For group work, more lamps are required, and four or even seven are necessary for large groups in an ordinary room. The lamps should be at least six feet above the ground, and we have obtained fine results with standing

figures with lamps eight feet high. The expense of fitting up such an installation is by no means great, provided the operator has a little constructive power and is handy with his tools, and good results can be obtained and good amusement given to both old and young in winter evenings or even now at this time of the year. Of the application of the flashlight in conjunction with daylight, we need hardly say much; arrange your sitter as you desire, and allow the shadow side of the face to be that illuminated by the daylight; that is to say, burn your magnesium ribbon or flash on the side of the sitter away from the light, and trust to the daylight for lighting up the shadow side. A little practice and ingenuity will soon enable one to turn out good results, and for children, babies, and such small fry, some such arrangement as this or the flashlight is absolutely necessary.

### TWO NEW DEVELOPERS.

ACCORDING to *Les Annales Photographiques*, M. A. Noël, a French chemist, has discovered a new developing agent, kinocyanine, whilst preparing kyanol or bleu de Paris. The new agent is stated to have a probable formula of  $C_{25}H_{12}C_{10}$ , and is in the form of an amorphous powder or ill-defined small crystals of a bluish violet with greyish tinge. It is soluble in water, alcohol, and ether, and the solutions are green and violet. A few drops of hydrochloric acid turns the solution a cherry red with a faint fluorescence. Sulphite and bisulphite of soda and sulphurous acid produce the same change of colour. The name kinocyanine has been given to it from its similarity to vegetable cyanine and quinone. It is a powerful reducer of the noble metals, silver, gold, and platinum, and is therefore a good developer for gelatino-bromide plates. It is as soft in effect as ferrous oxalate, as energetic as pyrogallol, less flat and slower than eikonogen, and less hard than hydroquinone; it is more energetic, however, and more stable and less expensive than any of these. The following is the formula given for the developer :—

Sodium sulphite .. .. .	50 grammes
Sodium hydrate .. .. .	1 gramme
Sodium carbonate .. .. .	140 grammes
Kinocyanine .. .. .	10 "
Distilled water .. .. .	1,000 c.cm.

Dissolve and filter.

In *Le Moniteur de la Photographie*, MM. Auguste and Louis

Lumière give the results of their research on what would prove to be possible reducers of the nobler metals. Dr. Andresen, as is well known, has been trying the phenyldiamines with fairly successful results, and it occurred to MM. Lumière that the paramidophenols would act in the same way.

Paramidophenol may be represented by the following graphic formula:—

And it can be prepared by the reduction of paranitrophenol, or nitrosophenol, with tin and hydrochloric acid. It is obtained in the form of thin laminae, of which one part dissolves in ninety parts of water at 0 deg. C., the solubility increasing slightly with the rise of temperature. The aqueous solution oxidises rapidly in air, and much more rapidly in the presence of alkalies, and the solution becomes a deep violet-red colour.

The action of this agent in the process of developing is stated to be as follows: The water of the developer is decomposed, the paramidophenol appropriating the oxygen and forming quinonimide, and the hydrogen, reducing the silver bromide, gives hydrobromic acid, which combines with the alkaline base and produces a bromide. The following is the formula for the developer:—

Paramidophenol .. .. .	12 grammes
Sodium sulphite .. .. .	200 "
Carbonate of soda .. .. .	100 "
Distilled water .. .. .	1,000 c.cm.

Or,

Paramidophenol .. .. .	12 grammes
Sodium sulphite .. .. .	200 "
Lithium carbonate .. .. .	12 "
Distilled water .. .. .	1,000 c.cm.

The first formula gives excellent results for instantaneous work. The disadvantage of low solubility is one possessed by eikonogen and hydroquinone, and the new agent has the advantage of never staining the gelatine. The present price of paramidophenol, about 15s. per oz., is prohibitive, but with extended demand this would quickly fall.

## Letters to the Editor.

### WHAT IS AN AMATEUR?

SIR,—When any ailment breaks out periodically, an attempt is generally made to find out the cause, and as soon as possible remove it. Why cannot the same plan be adopted in the case of the ailment known as "What is an amateur photographer?" The cause is undoubtedly the distinction between professional and amateur; then let us get rid of it. It is a curious fact that in the higher walks of art this distinction is unknown. Who ever heard of an amateur painter, an amateur etcher, or an amateur engraver? and yet we have had a celebrated judge, a leading physician, barristers, and people well known in society exhibiting their pictures and works side by side with "professional" artists, aye, and striving for medals and other honours, without complaining that they are handicapped or desiring any distinction being made.

Considering the very great strides that pictorial photography has made in the last few years, and the claim that it now makes to be placed almost on a level with many of the other forms of pictorial art, I think the time has certainly arrived for dropping the word "amateur" altogether.—Yours, etc.,

AN OLD AMATEUR.

### A SOCIETY FOR GUERNSEY.

SIR,—At the request of many friends interested in photography, and now that the photographic season is getting in full swing, I am anxious to see whether it be not possible to form a camera club in Guernsey.

I mooted the foregoing proposition to a few amateurs about six months ago, which, however, fell through, no doubt owing to insufficient publicity being given to the idea.

As there is no society in existence in the island, and as the tourist season is at hand, I feel sanguine that if my idea be given publicity through the columns of your valuable journal, it will meet with general approval.

As soon as sufficient names are handed in, a meeting will be called to arrange matters, and in the meantime I shall be glad to hear from any to whom the idea commends itself.—I remain, yours truly,

46, Bordage Street, Guernsey,  
May 21, 1891.

A. B. CARRE.

\* \* \* \*

### PHOTOGRAPHS OF CELEBRITIES.

SIR,—I have for many years experienced difficulty in obtaining photographs of certain celebrities—many will not take the trouble of visiting the professional studio; others have objections to their photographs being published; and some are photographed and unknown to the photographer as being in demand by the public, and are, therefore, not in circulation. It has occurred to me that some of our celebrities may give sittings "at home" to their amateur relatives or visiting friends, and would not object to the issue of the photographs if likely to confer any benefit upon the said amateur. Without any desire to injure the professional photographer, why should not an amateur put into circulation a photograph not otherwise obtainable? I shall be pleased to answer any inquiries as to the value of any negatives for publication purposes—confining myself to portraits of personages noted in literary, legal, and scientific circles. Lovely landscapes, etc., are too numerous; life is short.

Since writing above, I have been reading your correspondence "What is an Amateur?" I am now afraid if you insert my letter it will be a bombshell thrown into the controversy. However, if an amateur does not wish to lose his status, can he not retain it by devoting the proceeds of his sales to some charity?—Yours, etc.,

217, Albany Street, N.W.

WM. GILL.

### THE CARDIFF EXHIBITION AND LANTERN SLIDES.

SIR,—If we may trespass upon your valuable space we should like to explain the *raison d'être* of Class 15 at the forthcoming Cardiff Exhibition. Our object in offering an optical lantern for the best fifty slides of a town or district is merely an incentive to societies to form such collections, and although we stipulate that the winning slides shall become our property, they are intended to form a loan collection to circulate amongst the British and American societies.

Of course, with the present high standard of lantern slides, the whole of the work sent in should form most interesting collections, and by arrangement with the competing societies a valuable slide exchange should result, and here, we think, the utility of the scheme comes in. We trust, therefore, it will receive the cordial support of societies generally.—Yours truly,

G. H. BEDFORD,  
T. H. FAULKS,

Hon. Secs.

\* \* \* \*

### GLEN LYN, LYNNMOUTH.

SIR,—It may interest some of your numerous readers to know that in consequence of the death of the owner of Glen Lyn, Lynmouth, the place is let to Mr. Bevan, proprietor of the Lyndale Hotel, who makes a charge of 2s. 6d. for admission to the grounds with permission to photograph; the ordinary charge without a camera is sixpence.

As the valley of the West Lyn runs nearly north and south, about nine to ten o'clock is best for photographic purposes.—Faithfully yours,

May 25th, 1891.

DOUGLAS A. WRIGHT  
(Commander, R.N.)

## Studies in Art for Photographers.

By REV. F. C. LAMBERT, M.A.

### CHAPTER VIII.

#### INTERCHANGE.

MR. RUSKIN has used the term interchange to express a certain well-known and frequently used device which hitherto did not seem to have had any definite name. In a broad and general way, we may interpret this term to mean the taking of one part of a composition and exchanging for it something of a somewhat opposite character. Thus, suppose a picture to consist of a mountain, one side of which is a broad patch of light, the other of dark shadow.

Now, although we have here great simplicity and breadth, yet there is a tendency to insipidity, monotony, and a "plentiful lack" of interest. Suppose now we borrow from the dark side some patch of shade—say a tree, a rock, a thatched hut—and carry it into the region of light, at the same time compensating matters by carrying back some light patch—a haystack, a light-coloured cottage, etc.—into the dark part of the picture. Comparing the present state of affairs with the first condition (the roughest pencil sketch will suffice), we shall be led to note that the "interchanging" of parts has given interest, relieved the obtrusive monotony of arrangement, and, if done with due regard to certain other matters, the general breadth of the picture is not only undiminished but very probably emphasised.

It will be urged that it may be within the power of the painter to remove cottages at will, uproot trees, and slice down mountains, but that the photographer neither has nor desires these powers. Yet, be it observed that the latter can often make or mar a picture by the simple expedient of moving a few feet to the right or left, backward or forward, or by raising or lowering the camera, etc., and in that way cause the various objects to appear in different relative positions, according to the various points of view from which they are seen.

Now, in seeking to apply this well-recognised principle, although it seems hitherto to have escaped any very distinctive treatment, it is well to remember certain broad limitations. These are the natural offspring of other great principles, the first of them being the law of principality. This at once suggests that the parts interchanged should not be of importance equal to that of the principal focus of contrast—either as regards relative light (values), size, or interest. Otherwise a rival to the chief feature would be at once set up; in other words, the "highest light" must be the *highest*, *i.e.*, without any appreciable rival; so in like manner with the deepest dark. Again, both in the matter of size and form (and, with the painter, colour tint also), there must not be rivalry, but just the very opposite, *viz.*, harmony, order, subordination, unity, fitness, symmetry, continuity, balance. So also as regards the contrast, or theme-interest, there must not be rivalry but co-ordination; this last-named is of the utmost importance in all those pictures which are calculated to tell a tale.

The unobservant may be tempted to exclaim that this is all dreaming, theorising, etc., which finds no support in nature. Now, I would ask such a doubting Didymus to perform the following simple experiment. Let him take (into his back garden) any simple object, neither very light nor dark—a spade-handle or even a walking-stick—let him place it so that one-half of it comes against the sky and the other half against a dark object, say some dark roofing slates. Retiring now a few steps, let him note that where the object appears against the sky it seems decidedly dark, and where it appears against the slates quite light. Observe a tree against a hill-side and against the sky. Note how

the curly smoke appears blue against the dark thatch, but against the sky suddenly becomes brown. We may explain much of this by going back to the first principles of contrast, etc., and also the different results of reflected and transmitted light, etc.; but to explain it as you will, the *natural* fact remains, and the artist's chief business is to observe nature and then record his observations.

Every one is (or ought to be) familiar with the general pleasing effects of water reflections. Suppose we are once more among the hills, and the sun is setting behind a ruined building, the reflection of which scene is presented to us by an adjoining tarn. We may easily hide from view with the hand the reflected part of the picture, but we shall experience a feeling of loss on so doing. Now, observe carefully in such a case, how in the reflected picture the lights are not so light, and the darks are not so dark as they are in the original. Observe too how the pictorial interest is increased when we move our position so as to introduce a few foreground reeds, pebbles, etc. The strict repetition of form is thus relieved—still more so is it the case when a slight puff of wind disturbs the surface of the water. Thus may we study the varying degrees of variety. Now, observe any photograph in which the chief object of the worker seems to have been the representation of the most vivid reflection possible, the sort of thing that the proud possessor tells you "looks just as well one way up as the other." The effect is of course nothing short of disastrous; artistic suicide. The mental effect of this mechanical repetition can only be compared to the state of mind induced by the man who button-holes you and tells you as a new and original thing of his own, the very latest and best of your own witty composition that you had told him about a week ago.

To return to our pictures, or rather our *reflections*, the example above quoted shows us how easy it is to cut oneself when playing with edged tools of which we know not the proper use. The reflected image is a tool which in skilful hands has been made to produce the most beautiful work; while in the hands of others (woe be it said! chiefly photographers) it has also produced effects for which politeness forbids our seeking an appropriate name.

Any one who has followed me so far in this and the preceding papers of this series, will probably have observed that my object has not been simply or chiefly to set forth a number of rules, laws, or working guides, but rather to stimulate interest and attention towards the principles which seem to underlie these working rules. Now, although it may be easy to commit to memory a rule, yet the appropriate application of it in actual practice becomes mainly a matter of chance without some guiding principle—some "why and wherefore," so that the student knows how to treat each case on its individual and even slightly different merits.

It will also have been observed that these rules remind one of the old saw about fire and water being good servants but bad masters. This, because it is easy to carry them to a "vicious excess."

Now, in the case immediately before us the vicious excess of reflected repetition as an extreme case of interchange points the moral. Nor is the principle of moderate virtue far to seek. We find it supporting our greater laws of principality, subordination, harmony, and so on, as already mentioned. But further, it leads us towards, and in a certain sense acts as a connecting link between another closely related principle, *viz.*, that which is frequently referred to as repetition or echo. But our dangers in using it unwisely are not only that of rigid symmetry of form as in reflected images, but also its excess tends to spottiness, to diffusion of interest, to monotony in design, producing the impression of general

weakness, while its judicious application assists us ably in supporting the leading idea (this may be better considered under the head of repetition), in giving us many intermediate grades of light and dark, in leading up to the theme by degrees of interest, relieving monotony, and generally acting as a connecting link throughout the various parts of the picture.

## Photographic References.

By MAJOR J. FORTUNÉ NOTT.

### DEVELOPMENT.

(Continued from page 335.)

THE next class of developer calling for attention is the one in which hydroquinone plays the most prominent part. Some ten years ago Captain Abney drew the attention of photographers to this compound, but it is only within the last two or three years that it has gained the popularity which it now enjoys. It certainly possesses some advantages over pyrogallie acid, to which, however, it is very closely allied, but it also in a few respects compares unfavourably. The features that recommend it to photographers are as follows. It works in a clearer and slower manner than pyro, and therefore enables development to be performed without that staining of the fingers which is almost unavoidable with the other developers, and its slowness of action enables a greater degree of control to be exercised over the character of the negative being produced. The developing solution, although it gradually darkens, does not get muddy after the manner of pyrogallol, and its deterioration, if a preservative of sulphite of soda or metabisulphite of potash has originally been mixed with it, takes place in such a gradual manner that it is possible to use the same developer for a number of negatives. The only difference being discernible is that the action becomes slower and slower. It is, therefore, a very economical developer. But it is not wise to use hydroquinone in this manner if it can be avoided, although it is well to know that the power exists, for cases may arise now and again when it is a great convenience to be able to avail oneself of its capabilities in this direction. But it must be remembered that hydroquinone will work all right up to a certain point, and then appears to go bad all at once. Its effect, directly this stage has been reached, is one that is destructive to the negative, for the plate comes out of the bath somewhat stained, and clouded all over as though it had been partially fogged by light. The negative may begin to appear bright and clear and the detail be fine and distinct after the manner peculiar to the early stages of hydroquinone development, but all at once the clouding-over action takes place, and there is no salvation for it. We therefore repeat the advice, do not use the bath more than twice or thrice at the outside; in fact, we question whether it is wise to use it more than once without freshening it by throwing some of it away, and adding an equal quantity of fresh developer. It is not a good principle in development to be too economical with the developer, and this holds good with hydroquinone as well as with pyro.

Another good quality about hydroquinone is that it can be used for all kinds of work, negative making, lantern slides, bromide paper, and opals. It has therefore earned the title of the universal developer, and this is a quality which is of a distinct advantage when anyone dislikes to have that quantity of chemicals and bottles lying about which formerly were considered indispensably necessary for photography. Hydroquinone does undoubtedly produce

clear, fine detail, and is therefore a developer which possesses distinct advantages in lantern slide-making with the ordinary commercial dry plate. Its freedom from those staining qualities which the ferrous oxalate developer possesses, together with the slowness of its action, have endeared it to the majority of photographers who use bromide papers for printing or enlarging purposes. But the clearness of colour obtained by hydroquinone, although of great advantage in a lantern slide, where it confers beauty to the work, is not to be commended in negative-making, for when this clearness of glass is visible the printing quality is not nearly as good as it is in a negative where the greenish or yellow stain is visible which pyro and soda or pyro and ammonia nearly always produce. Another drawback about using hydroquinone for negative making lies in the fact that the same control over the character of the negative cannot be exerted, because altering the constituent parts of the developer does not appear to produce similar results, and again the tendency of negatives produced by hydroquinone is to err somewhat on the side of over-density. The controversy respecting the good and bad attributes of the various developers seems to have established the following points: For developing negatives use pyro and soda, for lantern slides and bromide paper use hydroquinone. A very good formula for hydroquinone is the following:—

#### HYDROQUINONE.

##### (A).

Hydroquinone, best quality	..	..	150 grs.
Sulphite of soda	..	..	440 "
Bromide of potassium	..	..	25 "
Water	..	..	to make total bulk 20 ozs.

##### (B).

Carbonate of soda (not bicarbonate)	..	900 grs.
Carbonate of potash	..	900 "
Water	..	.. to make 20 ozs.

For use, take equal parts of each. If it works too energetically or acts too intensely on the high lights, then it is as well to dilute the mixed developer with a little more water. But it must not be made too weak.

There are many other formulæ which different plate makers recommend, and they all appear to be equally good, but one or two of them may have special advantages when the developer has to be used for shutter work or in cases where the exposure has erred somewhat on the short side. Avoid using any of the hydroquinone developers in which ammonia is used as the alkali.

The developer which hydroquinone is fast supplanting is the one known as iron or ferrous oxalate. By many skilful workers it is the one they use and recommend for all classes of work. It does certainly yield beautiful negatives, but it does not appear capable of forcing out detail that is sluggish in making its appearance through under-exposure, in the same way that pyro and ammonia will do; or, at any rate, the process takes considerably longer time, an element which does not recommend it for this class of work. For lantern slide making and printing with bromide paper, it will always have its warm supporters.

The following is the formula which is in general use:—

#### POTASH.

Neutral oxalate of potash	..	..	10 ozs.
Warm water (distilled if possible)	..	..	30 "

#### IRON.

Ferrous sulphate (proto-sulphate of iron)	..	..	3 ozs.
Citric acid	..	..	60 grs.
Water	..	..	10 ozs.

For use, mix one part of iron to three of potash, and never fail to remember that the iron must be poured into the potash, and not the reverse. The effect of pouring the

potash solution into the iron one is to completely spoil the developer. Never omit the citric acid in the iron solution. The nearer both the stock solutions are to a saturated condition the better. If the plate being developed is a little over-exposed, the developer should be restrained with a few drops of the ordinary bromide of potassium solution, but it is not wise with a ferrous oxalate developer to use it heavily restrained. If an iron developer is being used upon an under-exposed plate a few drops (never by any chance more than fifteen to the ounce) of a solution of hypo-sulphite of soda, 10 grains to 4 drachms of water, can be added with a very beneficial effect, but the negative resulting, while possessing the necessary detail, will, in all probability, be lacking in density, which fact may have to be corrected by subsequent intensification.

(To be continued.)

## Painters and Photographs.

THE rapid extension which has of late taken place in the utilisation of the camera by those who, working with the brush, with justice lay claim to being the chief exponents of "high" art, requires at our hands some passing attention.

That photography is capable of rendering valuable aid to the disciples of painting is, of course, by no means a very recent or novel discovery. So long ago as when the "Elements of Drawing" was written, Ruskin expressly advised art-students to spend some time in carefully copying photographs. "If you cannot get a print from the Liber Studiorum," says he, "get a photograph. . . . You had better get a photograph even though you have a Liber print as well." There is no doubt that this advice has been in many cases followed. But it is not merely art-students who have profited by it; fully pledged artists have also done the like with a considerable amount of advantage to themselves and to the art of which they are votaries. There is, however, one thing they have until lately left undone, *i.e.*, failed to acknowledge their indebtedness to our art-science. They have in point of fact maintained a conspiracy of silence.

But within the last few months a great change has come over the spirit of the dream. The employment of the camera in collecting facts and impressions for the making of pictures has become so universal that it is impossible for painters to repudiate its claims for some share of credit as an important help to the artist in the correct and successful rendering of his conception or design.

It has indeed now become quite rare to find a painter who does not readily "own up" to making use of photographs of clouds, foregrounds, foliage, waves, transitory effects, and moving objects.

While such memoranda are employed in a strictly subsidiary fashion (and no good artist would dream of making other use of them), and are merely used in order to save time in the observation or verification and recording of either the items or the moods of nature, there can be no possible objection to such a practice. Quite the contrary, inasmuch as while a painter has a literal rescript of, say, a landscape before him in the shape of a photograph he cannot easily stray far from truth of form, nor be guilty of the glaring errors which we have all at times grieved at in the works of even our leading masters.

When, however, photography comes to be used as an adjunct to portrait painting, there is a good deal to be said against doing so; but as we are for the moment not greatly concerned as to what portrait painters or their patrons may think on the question, we shall not here discuss the ethics of this practice. Enough that on various pretexts, and very often not in the open manner in which landscape

painters now use photography, the limner of faces obtains prints of his sitters from which he corrects his drawing. The most usual excuse made is that the photograph is only wanted to get the folds of the drapery, or else to save the necessity for long or frequent sittings.

A more novel and further extension of the foregoing applications of photography is to use a lantern-slide made from a negative of the required subject. This is projected on to an ordinary canvas; by moving the lantern further or nearer, the image can be made to assume the exact size required; it is then painted or sketched in, the operation being somewhat akin to tracing. This utilisation of the optical lantern is much favoured by those who paint horses, dogs, and other animals, which, on account of the impossibility of getting them to remain in, or return to, a desired attitude, are very difficult to draw with reasonable accuracy. Another but a somewhat questionable application of photography to painting is to enlarge a negative on a specially sensitized canvas; this enlargement is then used as a ground-work, and eventually hidden by the paint which covers it. Portraits and landscapes so produced are sometimes palmed off as the sole and original work of the man who sells them. Such a transaction, it is hardly necessary to say, degrades all concerned in it, and as far as the buyer is concerned, is the more objectionable inasmuch as there is every reason to believe that the bastard work of art is not more enduring than are the promises of politicians.

From some enquiry which we have made amongst artists, it appears that, including portrait painters, they mostly work with a hand-camera (that is, where they do not buy their photographic studies from the dealers); and almost without exception, they do not seek to take "pictures," but limit themselves to obtaining a literal record of such objects or phases of nature as they desire to make a note of or think likely to be useful. There is one large and praiseworthy class who will hail the firm and recognised establishment of photography as an aid to painting with much rejoicing, *viz.*, the amateur artist. It is an open secret that the majority of those who belong to this category have always found their greatest difficulty in the *pons asinorum* of painting, *i.e.*, the accurate drawing of the objects included in the composition; but now, thanks to the professional showing the way, amateurs, without its being considered in any way *infra dig.*, may freely correct their errors of delineation by means of the so far faithful photograph. Some there are, no doubt, who may be sufficiently old-fashioned to reject with scorn the, to them, mortifying help of the sensitised film, just as some of our forefathers, who rejoiced in "the tantivy trot," refused to use "the hissing steam-pot." To all such we answer that most of the more striking works which will hang on the walls of the Royal Academy Exhibition owe much of their truth to the direct or indirect assistance of photography; and to the enterprising and ambitious amateur painter we say, "Get without delay, a camera, and learn how to use it, if you wish to compete on anything like equal terms with your professional brethren. And if you desire to become familiar with the *modus operandi* of photography, the quickest, cheapest, and far the most pleasant way is to join the nearest photographic society." We do not know of one in the three kingdoms which does not include several members ready and willing to show beginners how to begin, and there are now so many associations devoted to the elucidation of all which concerns our art-science scattered up and down the face of the country that he must be an unfortunate individual who is out of reach of one of them. To all such unlucky ones and others, the columns of our paper are always open, and we are at all times especially pleased to initiate a novice in the art and mystery of making sun-pictures.

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XVI.

LENSES CONSIDERED AND CLASSIFIED WITH RESPECT TO THEIR CAPABILITIES FOR INSTANTANEOUS WORK.

(Continued from page 334.)

III. *The Euryscope Lens.*—Two or three years ago, Messrs. Voigtlander brought out a lens which they named the "Euryscope" (similar lenses are now made by several other firms), and in which they attempted to combine the valuable light-admitting power of the portrait lens with certain qualities previously possessed only by lenses of the "symmetrical" or "rectilinear" type, presently to be described.

The largest aperture of the Euryscope lens is either

$f/6$ , or a little larger than this— $f/5.65$ . This is an extremely useful lens for instantaneous work. It is sufficiently small and light in the small size; and its large aperture is often useful.

FIG. 2.

#### IV. "Rapid Rectilinear"

*Lenses.*—We come next to the most popular and generally useful lens of the present day—the "Rapid Rectilinear"

FIG. 3.

of Dallmeyer, or "Rapid Symmetrical" of Ross; made also a practically identical form by all or nearly all lens manu-

facturers, and known by many names (see figs. 2, 3, and 4). Most of these names begin with the word "rapid," indicating that the lens has a large aperture in proportion to its focal length, and their second name usually tells that they are capable of correctly reproducing vertical and horizontal straight lines. This lens appears to have been invented, independently, by Steinheil and by Dallmeyer about a quarter of a century ago. Its largest aperture is usually  $f/8$ ; that is, a lens of eight inches focus has its largest stop one inch in diameter. These lenses give excellent results in instantaneous work.

FIG. 4.

V. *Wide-angle Rectilinear Lenses.*—The great objection to the use of "wide-angle" lenses for instantaneous work is the fact that they necessarily work with a rather small aperture, so that they are *slow* lenses. Their largest stop usually equals  $f/16$ , so that the largest stop of a wide-angle rectilinear of eight inches focus is only half an inch in diameter. This class of lens (fig. 5) is wholly unsuited for instantaneous work.

FIG. 5.

*Single and Double Lenses.*—All the lenses we have so far described may be called double, or "doublet," lenses. They consist of a pair of lenses, mounted one at each end of a tube, the diaphragm or stop being placed between them. Such lenses (as now made) combine to as great an extent as can be expected the qualities which we desire of a lens.

The principal points we require of a lens are: (1) rapidity, (2) truthful representation of object, (3) flatness of field, (4) equality of illumination, (5) achromatism, (6) agreement of the chemical and the visual foci, (7) depth of definition.

It is in the first and second of these points that the doublet lens excels; and for objects which contain straight lines, as houses, architectural subjects, street views, etc., such a lens is a necessity.

VI. *Single or "Landscape" Lenses.*—Single lenses (fig. 6) are inferior in this point of rectilinearity; they cause straight lines, which fall near the margins of the pictures they produce, to appear more or less curved. But a still greater objection to single lenses for instantaneous work is their want of rapidity; their largest aperture is usually  $f/16$ , though a "rapid" landscape lens (fig. 7) is now made which works at  $f/11$ .

VII. *A New Lens which is Rectilinear though Single.*—In Dallmeyer's "rectilinear landscape lens" we have a lens which, though apparently a single lens (it has an air-space in the centre), yet gives straight lines. It is an admirable lens for general work, and may be considered as linking together the two classes of "doublet" and

FIG. 6.

"single" lenses. The single lenses are often termed "landscape" lenses, because they are specially suited for landscape work. In landscapes the slight distortion towards the margin caused by a single lens is quite unnoticeable.

FIG. 7.

We have spoken of lenses as "single," but it must be understood that each "single" lens (or each component of a doublet lens) is itself made of two, or perhaps three lenses, cemented together by means of Canada balsam. This combination of pieces of flint and

of crown glass of varying curves and densities is necessary in order to secure that the image shall be achromatic (i.e., free from coloured fringes round the margin of the objects depicted), and that the chemical and visual rays shall be brought to one and the same focus.

*Summing up; Choice of Class of Lens for Instantaneous Work.*—A consideration of the qualities of the various classes of lenses which we have now described shows clearly enough that for general instantaneous work class III., the Euryscope lens, and class IV., the rapid rectilinear lens, is to be preferred above all others. In deciding between

these two classes of lenses we can only say that there is little or no difference; for though the Euryscope lens works at a larger aperture yet that aperture is seldom needed, and the lens is more expensive. We should therefore bracket these lenses as equally good for our purpose. The best qualities of each have been enhanced during the last year or two, by the introduction of new kinds of glass made at Jena, by which greater flatness of field is secured without the loss of other good properties.

But there is a special class of work for which single (landscape) and long-focus lenses answer admirably. This includes all work on the water, or from piers; such as yachting scenes, steamers, etc. Here we have plenty of light; while at the same time it is usually necessary to operate from a rather considerable distance. It is no secret that the most successful "marine" professionals prefer a long-focus landscape lens for such work.

The relative amount of light which passes through the largest stops of each of the seven types of lenses we have now described is shown in fig. 8. We see that the areas of the largest stops of the portrait lens and the W.A. Rectilinear are as 4 to 64, i.e., as 1 to 16; so that the necessary exposure with the latter lens is just sixteen times greater. Or, comparing the W.A. with the R.R., the relations are as 16 to 64 = 1 to 4; i.e., the exposure with the W.A. must be four times longer, because only one-fourth the light is admitted.

FIG. 8.

(The circles show the comparative sizes of the largest stops of seven different types of lenses, all of six inches focus. Taking the aperture of the "Baby" lens as unity, we see that the largest stop of a landscape lens is only one-sixty-fourth as large.)

## Colour-Sensitive Plates.

THE use of orthochromatic, isochromatic, orthoscopic, orthoskiagraphic, or colour-sensitive plates is gradually gaining ground in England, not only for special purposes, such as photo-micrography and copying pictures and other coloured objects, but also for outdoor landscape work and portraiture. Hitherto the dyes of the eosine group, fluorescein, uranin, eosin, erythrosin, rose-bengal, and phloxin have been used, and the application of these dyes in conjunction with an alkali is protected by a patent, and therefore individual workers are debarred from using the same without a licence from the English agents and manufacturers, Messrs. B. J. Edwards and Co. Some little time ago Waterhouse suggested the use of rhodamin, and this was tried and reported on by Bothamley at the last Photographic Convention. We have been trying the dye, and find that very good results are to be obtained with it. But before entering upon this we must call the attention of our readers to a most valuable contribution to the literature of orthochromatic photography from the pen of Dr. J. J. Acworth, F.I.C., F.C.S., which appears in the April number of the *Quarterly* on "The Relation between Absorption and Sensitiveness of Sensitised Plates," in which the following passage occurs:—

"*Rhodamine*.—I may here conveniently consider the sensitising and absorptive action of this dye; as it bears some distant relationship to the eosin series, being a dimethylamidophthalein. Rhodamine is easily soluble in water, the silver salt also being readily soluble, much more so than the corresponding eosine salt.

"A gelatine film stained with the dye shows an intense absorption band in the yellow-green, and, in comparison with that of eosin, more towards the less refrangible portion of the spectrum. The absorption begins at a little on the more refrangible side of D, rising at once to a maxim as far as D $\frac{1}{2}$ E, after which it descends first rapidly and afterwards slowly, and ends just before reaching F.

"For sensitising purposes I used amounts of the dye varying from .05 to 2 grams to every 2 grams AgBr employed, and with ammonia. Sensitiveness begins at C $\frac{1}{2}$ D, reaching a maximum equally on both sides of D. Beyond D it descends rapidly at first, thence gradually, and ends at F, showing but little sensitiveness beyond.

"The absorption of this emulsion begins at D $\frac{1}{2}$ E, rapidly rising to a maximum on both sides of D $\frac{1}{2}$ E, after which it decreases, rapidly at first, and gradually afterwards, ending at a little beyond F, and in the blue absorption again commences.

"With an emulsion containing less dye I got a very similar curve of sensitiveness and of absorption."

For our own experiments ordinary commercial plates were taken and bathed in a solution of rhodamin, 1 : 1,000, with 1 per cent. of ammonia, and then dried in the dark, and a solution was also used corresponding to the usual erythrosin silver sensitising bath; that is to say, an equal quantity of nitrate of silver and dye was used. On the addition of solution of silver nitrate to solution of rhodamin a faint cloudiness only is visible, which is immediately cleared up on the addition of ammonia. On adding silver nitrate to erythrosin, the dye is at once precipitated in the form of the so-called erythrosin silver, differing in this respect from rhodamin. Rhodamin gives a solution with a more decided crimson tinge than erythrosin, but possesses as fine, if not superior fluorescence even than eosin.

On testing the plates treated as above, the following results were obtained:—

(1) With a simple ammoniacal solution of rhodamin:

Sensitometer Number before Bathing.		Sensitometer Number after Bathing and Drying.
(a) 15	....	13
(b) 22	....	21
(c) 25	....	24

For testing the yellow sensitiveness a yellow screen was used between the luminous tablet and the number screen,

and for comparison an Edwards' isochromatic slow plate was used, and the following results obtained:—

Edwards' Slow.		Rhodamin Plate.
5	....	3-4

(2) With an ammoniacal solution of rhodamin and silver nitrate:

Sensitometer Number before Bathing.		Sensitometer Number after Bathing and Drying.
(a) 15	....	15
(b) 22	....	22
(c) 25	....	25

On testing for yellow sensitiveness, as described above no increase was noted.

There is decidedly a strong increase in yellow sensitiveness obtained by the use of rhodamin, though inferior to that obtained by the use of erythrosin. Nor does the addition of nitrate of silver to the bath appear to increase the yellow sensitiveness, as is the case with erythrosin, but, as was to be expected, the addition of silver increases the general sensitiveness. In all the above experiments a "vorbath" or preliminary bath of ammonia was used to soften the film and ensure equal absorption of the dye solution by the film.

The next important point is as to the keeping qualities of the plates treated with rhodamin and rhodamin and silver. A series of experiments were begun with various dyes, such as congo, benzo-purpurin, naphthol red, rhodamin, etc., on October 13th, 1890, and some of the plates were developed at once and others were developed on April 13th, 1891, six months after. The rhodamin-bathed plates now developed show no sign of fog, and even those bathed with rhodamin and silver work quite cleanly, though there is a faint sign of marginal fog. The action of rhodamin with some commercial plates seems to be to give very much cleaner working plates than others, and this could not be ascribed to the presence of iodide in the emulsion, because this was tested for in two cases and proved to be absent. Further experiments are of course required to prove the true worth of this dye, and we hope to be able to give shortly some results when working with the spectroscope.

It is to be regretted that we have no one in England who can or will undertake a work such as done by Eder in the examination of the new dyes which are constantly being discovered. One of the difficulties we have met with is to obtain the dyes; small quantities only are of course required, and small quantities of an enormous number of dyes, as no actual value can be placed upon experiments on one dye, the characteristic or principal dye of a series, as one member of a series may give far better results than the others, as is the case with erythrosin of the eosin group, and as we have also found to be the case with the benzo-purpurins.

To those of our readers desirous of entering this field of experiments we can heartily recommend the perusal of Dr. Acworth's paper, as it gives considerable information and throws a flood of light upon a point which has been frequently disputed over, and even denied, and also because the results there given may be used as stepping-stones or a ground-work on which to conduct other experiments. Thus from this paper we find the best method of determining the exact position of the sensitising action of the dye, and we must before commencing investigations of this kind come to a clear understanding as to the particular section of the spectrum for which we require a sensitiser. A cursory glance at the spectrum will show us that the most suitable dye is one which will sensitise from E to C, or more accurately perhaps from  $\delta$  to C, that is from the limit of the green, or even into the cyan blue through green and yellow to the limit of the orange on the red side. The sensitising action of erythrosin extends from E $\frac{1}{2}$ F to C $\frac{1}{2}$ D, with maxima and

minima of action between these limits, whilst from Dr. Acworth's experiments, rhodamin sensitises from  $C_{12}D$ , and then subsides slowly towards F. We have begun some experiments with primuline, but are unfortunately not in a position to give definite results at present.

## Reviews.

*Lehrbuch der Mikrophotographie von Dr. Richard Neuhaus.* Published by Harald Bruhn, Braunschweig. Price 8s.

In this work we have at once the most complete treatise yet published, and by the pen of one of the first of Continental workers in this branch of our science. The book is divided into eight parts. The first treats of the apparatus, the second of the objective and eye-piece, the third of the illuminant, the fourth of the illumination or lighting, the fifth of arrangements for special work, the sixth of the negative image, the seventh of the positive image, the eighth of the preparation, the importance of microphotography, and a list of published micro-photographs. The first sections treating of the necessary apparatus, etc., is comprehensive and complete, and many terms peculiar to microscopy are clearly and lucidly explained, a point that is of importance to those photographers anxious to take up this particular study, as a great many writers assume that photographers are thoroughly acquainted with the microscope and its parts. The part devoted to the consideration of the source of light is by no means the least valuable in the book. A succinct resumé of every light source recommended for photo-micrography and the arguments *pro* or *con.*, enables the reader to at once make his decision without personally finding out the advantages and disadvantages. In the section devoted to photographic manipulations the author is equally happy. Plainly worded, concise directions tell us how to set about the various operations, and we are not burdened with a plethora of formulæ, the author contenting himself with giving the particular processes, etc., which have proved successful in his hands. The author is in error, however, when he ascribes to Schultz-Sellack the discovery of orthochromatic photography, this being, as is well known, due to Professor H. W. Vogel. The work is well written and printed, and contains numerous diagrams embodied in the text, and some exquisite collotypes and photo-gravures of photo-micrographs as an appendix, and we can thoroughly recommend it alike to the novice as the more expert hand.

*Etude Complète sur le Développement et les Développeurs.* Société Générale d'Editions, 24, Boulevard St. Germain, Paris.

This handy little book, which is by M. L. Mathet, the editor of "Elementary Lessons in Photographic Chemistry," deals fairly exhaustively with the use of pyro, ferrous oxalate, hydroquinone, and eikonogen, and gives advice upon the choice of a developer for various purposes. There is a chapter devoted to the dark-room and its equipment, and the question of temperature, and its influence on the action of the developer, is treated upon. There is also a chapter giving the process of phototype. It is published in paper covers at two francs.

*Pantobibliion*: An International Bibliographical Review of the World's Scientific Literature. Edited by A. Kersha, C.E. Published in England by Swan, Sonnenschein, and Co., Paternoster Square. Monthly, 2s.

This work is the first issue of a new monthly which is intended shall contain a classified list of all the new books, published in the principal languages in all countries and on different subjects, also some critical articles on the leading works and a review of the current periodical literature. If M. Kersha can keep his subsequent numbers up to the standard of the one before us, his work will be of immense value to the editor of every paper, the scientific man, and above all to the librarian and investigator, and still more so if the subject matter in the three divisions is arranged alphabetically. At present one has considerable difficulty in finding any particular subject, as no sort of order is kept to. Except for this fault, the work is of great value, and considering the difficulties of printing simultaneously in Russian, French, English, and German, is exceptionally free from errors. Another feature which we should like to see in future numbers would be the price and publisher's address of the periodicals, as this would enable readers to order any special number which contained an article which might be of special interest to them.

## Thursday Evenings at the Camera Club.

BY ONE OF OUR STAFF.

MR. R. INWARDS presided at the weekly meeting on the 21st inst., when there was a good attendance to hear Dr. Acworth discourse on the "Flashlight." As was to be expected, a considerable part of the lecture was of a highly technical character, but the earlier part of it was extremely interesting, as it dealt with a visit to Professor Schirm, at Berlin. In commencing, the Doctor said that he believed that the flashlight might be found of great assistance in the production of artistic results, but until a few months ago he had but little idea as to what a splendid auxiliary it was for getting pictures as fine, if not finer, than by any other methods. In this country, however, the light seemed to be regarded very much as a toy, and artistic results from its use were, so far as he had seen, few and far between. There is likely to be a general agreement on that point, we think. That state of things did not exist on the Continent, for he had seen interesting and artistic pictures produced by it in plenty in Germany and elsewhere. Prof. Vogel introduced him to Prof. Schirm, who had fitted up a studio for using the flashlight only. The suite of rooms prepared were on the first floor, and were, in fact, ordinary dwelling rooms of large size. Of course, there was no top light, and there were no blinds or curtains of any description. There were reception and waiting rooms and two operating rooms, one somewhat larger than the other. The principal photographic accessories were the camera and its fittings, and the tubes—pneumatic and gas—connected with the flashlight burners, which were placed along the walls about 2 ft. below the ceiling. In the smaller room there were about ten lamps, and in the larger about fifteen, but only a few of the lamps were used at a time; usually only three or four, and they would suffice for groups of five persons on a plate 18 by 24 centimetres. Other German photographers had also adopted the light, some using it exclusively and some in conjunction with daylight. The doctor then expressed a wonder, which we have often felt ourselves, as to why in such a country as England, where the climate was so changeable, the light had not come into general use. The lamps were so easy to manipulate and so certain as to correct exposure. A gentleman at Breslau attended a fancy bazaar and took forty exposures by the light, and secured forty successful negatives. But Professor Schirm himself had done better than that, for he went to a fancy dress ball, and, between the hours of 9 p.m. and 5 a.m. secured no less than 218 exposures, many on orthochromatic plates with a screen, and all successful. The lamps the professor used are really Bunsen burners, so constructed that turning on the gas opened a valve and let the charge of magnesium powder fall so that it could be forced by the air pressure to the flame. As soon as one exposure was made, a hopper fed in another charge of the powder. Perfect combustion did not take place in the Bunsen burner, or when the mixed air and powder reached the flame it would cool it, therefore the supply of air to the burner was too small for perfect combustion. The shutter was worked pneumatically and electrically. When the pressure was given, it opened the shutter and forced the magnesium through the flame, and then before the whole light was utilised the shutter was closed electrically, thus considerably lessening the chance of movement during exposure. The professor had also invented several forms of portable lamps, each of which gave a different form of flame. In one, benzine ether was the igniting medium, and it had a high actinic power; no less than 1,300 flashes could be given with one charging of ether.

At this point the reader showed practically the working of the various lamps, and Mr. T. Chang exposed two plates during the explanation.

Continuing, the doctor said that the quantity of magnesium used in the flash was very small, from 3 to 5 centigrammes, and the cost of each flash was, therefore, about the fortieth of a penny. Professor Schirm also used the light for printing and copying, and the reader showed enlargements of photographs of the spectrum, which enlargements he had made in the tenth of a second by means of the light. He then went into the chemical value of the light as tested on ordinary and orthochromatic plates.

The proceedings terminated with a hearty vote of thanks to Dr. Acworth for his paper.

## Exhibitions.

### THE VIENNA EXHIBITION.

(From Our Special Correspondent.)

WE are enabled to give a few details of the Vienna Exhibition, which has been the subject of comment in our columns in the earlier part of the year. As our readers will doubtless remember, the main point which had to be observed in the selection of the pictures was artistic merit, and the judges were specially selected with this point in view.

The patron of the exhibition, Her Imperial and Royal Highness the Erzherzogin Maria Theresa, Infantin von Portugal, Geborenen Prinzessin von Braganza, sends four studies, which are perfect in technique and artistic skill. The Grand Duke Ferdinand of Tuscany exhibits also four mountain studies of great beauty. H.R.H. the Princess of Wales sends two frames full of small round instantaneous studies of very fine execution. Count Bardi has four fine French studies, the most praiseworthy being a market place, with pigeons feeding. H.I.H. Erzherzogin Stephanie sends a picture which could hardly be surpassed.

Count Hans Wilczek's picture of the midnight sun, taken in 1872, calls for special notice. Count Carl Cholek has a decided novelty, which is exciting much interest, namely, sitters photographed out of doors, with the sun full behind. Pictures are also shown by Counts Karl Brandis, Karl Esterhazy, Leo Mnischek, and Prince Heinrich Liechtenstein. Baron Stillfried depends upon some of his old laurels. Baron Albert Rothschild exhibits some magnificent portrait studies, which are only equalled in excellence of technique and artistic composition by the work of Baron Nathaniel Rothschild, amongst whose pictures "A View of Corfu" calls for special praise. Baroness Adolf Rothschild, of Paris, has sent some fine portrait studies in red chalk or Bartolozzi carbon.

The exhibition contains only two professional portraits, one a very striking study of "A Lady in White," by Oscar Suck, of Karlsruhe. Other striking works of Viennese workers are the landscape studies of Moriz Nahr, "A Snowstorm," by Max Putz, and the pictures of Baron Liebig, Bergheim and Schmidt's artistically interesting land studies, the latter of whom shows some fine interiors. Anton Einsle's landscapes are distinguished by some magnificent skies. H. Eckert, of Prague, has some striking instantaneous studies of laughing and crying children, which are, perhaps, only approached by the work of R. E. Festge, of Erfurt. Lieutenant Ludwig David's transparencies for window decoration are superb, and G. Schultz, of St. Petersburg, sends some fine winter landscapes.

England and America are distinguished by the excellence of their landscape exhibits. Emerson has sent no pictures, but some of his followers have sent some exhibits, notably Lyonel Clark's "Dedham Bridge" and "Dedham Lock," and George Davison's "Onion Garden," and Maskell's beautiful "Study of a Marsh." Ralph W. Robinson and Harry Tolley also must not be passed over. For genre pictures, H. P. Robinson and Miss Florence Harvey are capable exponents of the height to which this branch of artistic photography has been carried in England. The incomparable portrait of Professor Blackie by R. Faulkner cannot also be passed over without notice. American art is ably represented by J. E. Dumont's "Good Night," in which a man is shading a candle with his hand, an effect of lighting which found great favour in the seventeenth century, and which Mr. Dumont has ably carried out.

The older conservative school in photography is well represented by H. P. Robinson, with twenty pictures; J. Pattison Gibson, with his beautiful "Twilight;" Lyddell Sawyer, the most striking of whose pictures is undoubtedly No. 435, "On the Tyne," a perfect artistic rendering of a foggy and smoke-laden atmosphere. Fred Thurston, F. Worsley-Benison, and J. C. Douglas close the series of English and American artists, and many of our own workers will doubtless feel some incentive to further trials after artistic triumphs, when viewing this fairly representative collection of the works of the two leading schools of English photographic art.

The German school of amateurs is represented by some excellent work, notably that of Driesen and Heseckel, the latter of whom has followed closely in Emerson's footsteps and shows some charming results. Dr. A. de Lima's work is so well known here as to require but little praise—it is sufficient to say that it is quite equal to anything he has ever yet shown.

Italy comes well to the fore with the work of the Countess Loredana da Porto-Bonin, of Count Primoli-Bonaparte, Prince Ruffo de la Scellata and Vittorio Sella. To these schools we shall refer again, but the exhibition is undoubtedly a success and a fine show of 600 pictures is brought together selected from 4,000 sent in.

## Notes from the Liverpool Centre.

### LIVERPOOL'S FIRST '91 EXCURSION.

A HINT TO NORTHERN SOCIETIES.

(By our Special Commissioner.)

It is little use for photographers or anybody else grumbling about the weather. Growling will not cause the rain to cease, neither will it make the atmosphere warmer and the days brighter.

I am betrayed into this little homily because quite recently, as a special commissioner of the AMATEUR PHOTOGRAPHER, I journeyed into Wales with some twenty members of the Liverpool Amateur Photographic Association, the occasion being their first out-door excursion of the '91 season. The weather was certainly not of the finest, and several gentlemen of the party expressed themselves as not at all satisfied with travelling forty or fifty miles to encounter nothing—or very nearly nothing—but threatening gloom.

However, there we were, and we had to make the best of matters. And it so happened that a very good best it was.

Mr. Paul Lange, who was the leader of the expedition, of course, nothing can daunt or dishearten; and in this he was very ably backed by Mr. B. J. Sayce and other experienced operators. "Why," said the cheery Paul to a disconsolate group of youngsters who were bewailing the absence of the sun, "you may get better pictures on a day like this than if the sun were shining ever so brilliantly." I made a note of this, intending to interview Mr. Lange on the point one of these days. But to resume. I have seen some of the prints of studies taken during the excursion, and it must be conceded that they come out much better than one would expect. In all some 120 or 130 plates were exposed, and altogether, despite the "threatening gloom," the day was both profitable and enjoyable.

Our destination was Chirk, on the borders of Denbighshire and Shropshire—a district well worth visiting—and chiefly for the benefit of members of the northern societies who are prospecting round for excursion or holiday grounds, I am about to recount our experiences.

Chirk is within easy reach of Chester, frequent trains running between the two places from early morning until last thing at night. Arriving at Chirk, it is a good plan to send all unnecessary wraps and traps by a messenger to the comfortable Hand Hotel, about five minutes' walk from the railway station. Make this hotel your rendezvous; it is a good hostelry, cheap, and the management are accustomed to photographers. Having despatched your superfluities, strike up the hill to your right for Chirk Castle, a famous Welsh stronghold, dating back a thousand years or more and now the property of a Mr. Myddleton-Biddulph, who with his family are all photographers. Permission to photograph the interior of the castle may be obtained by writing for it, but the place on the whole does not lend itself much to good pictures. For photographic purposes it is perhaps too square, dark, and sombre, but good pictures may be had in the picture gallery, on the staircase, and one in the courtyard. The best exterior view is to be had from a lawn about a quarter of a mile from the castle, and to the left facing the principal entrance. Another picture is to be found in the entrance gate to the courtyard, but one of the best studies of all, is the entrance gate and lodge near the station. In the castle grounds, there are some fine tree studies and avenues which lend themselves readily and advantageously to stereoscopic work.

Having given the old retainer—who by the way, is a picture in himself—a small fee, and leaving the castle, retrace your steps towards the station again, near to which on your left you will see an entrance to the Llangollen Canal. By all means, walk a mile or so along the bank of this canal; you are sure of several very pretty scenes, the more so if you happen to meet with one of the numerous barges which ply on the waterway. None of the pictures taken by our party were more successful than those

taken here. Still more picturesque than the barges, perhaps, are the barge men, whose clothing, gait, etc., have quite a "year 1" appearance and add considerably to the canal pictures. A few coppers does the needful in each case.

By this time the operator will be in good trim for luncheon, and having finished that very necessary part of the proceedings—the air at Chirk is very appetising—he should take the road to the left from the Hand Hotel, first visiting the garden of the proprietor of the hotel, from the bottom of which on a clear day there is a panorama of magnificent scenery. Further down, on an incline from the garden, a mill affords an opportunity for a good shot, and then follows a hostelry and one or two cottages, an old bridge, and a narrow flowing river. Pursue the river a few steps to the left, and on the bank to the left side a very pretty study may be secured; a nice bend in the river, and the bushes and trees on either side contribute to a charming "bit." To the right of the bridge there is little or nothing worth taking, but ascending a height to the right overlooking the bridge, we come to another section of the Llangothlen Canal, and also have a good view of Chirk Viaduct and Church Aqueduct. There is nothing very tempting to the artistic eye in either of the latter features of the district, but as typical of the locality they are well worth taking. Crossing the aqueduct, the valley below offers one or two opportunities, and from this point of vantage, too, the viaduct is seen to best advantage. A train passing over gave an "instantaneous" worker in our party a chance for a good shot, but the light at the moment was hardly of the right kind for work.

At this point most of our party finished up, reserving one plate for a try at Chirk Church, which on the way back to the Hand Hotel peeps out at the end of a lane in inviting fashion. Tea brought an interesting excursion to a close. Upwards of 120 plates had been exposed, and, as before stated, with very excellent results. There are one or two other features of the neighbourhood including "Quinton," and a ducal estate which we did not visit, but which I learned permission could be got to photograph. Mr. Griffiths, the proprietor of the Hand Hotel, I have no doubt will gladly furnish all necessary information how to secure this.

Mr. Lange and the members of the Liverpool Society can be congratulated on the success of their first excursion of 1891. The trip need not cost more than 7s. 6d.

## Holiday Resorts and Photographic Haunts.

### A WALK THROUGH CAMBRIDGE WITH A CAMERA.

BY PERCY R. SALMON.

CAMBRIDGE, in my opinion, is a happy hunting ground for a camera man; here dozens of plates can be exposed, and he is never in want of a subject, and anyone spending a day or two in Cambridge will find it to be time well spent. In my daily walks I see plenty of hand-cameras in use; and anyone who has one should certainly bring it, as very good work can be done with it. On arriving at the station not much is seen of the town or colleges, but after about ten minutes' walk the visitor arrives at the new Roman Catholic church, which is a fine building, and the best view is from the S.E. It must not be taken with a lens embracing a very wide angle, or the resulting picture will be an eye-sore; it is best taken with an ordinary focus R.R. I have seen a picture of it taken with a W.A., and the tower stands like a giant, and the steeple seems to belong to a church further down the street. The church is always open, but the interior is too modern. The visitor ought now to turn to the left and go down Lensfield Road into Trumpington Street; at the corner is Hobson's Conduit, erected 1614. Proceeding farther down the street we come to Addenbroke's Hospital, which is a very plain building and not worth a plate. On the opposite side of the road is a very fine building, the Fitzwilliam Museum; the best view is obtained from the south. The next building is St. Peter's College, commonly called Peterhouse; it is the oldest foundation in Cambridge. The best views are the street front and the Second Court. The church adjoining is St. Mary's the Less, but it cannot be taken properly, owing to its cramped position. Opposite this is Pembroke College, and a plate may be exposed on the street

front; there is not much inside. The large church-like structure nearly opposite is the Pitt Press, and standing at the end of this we get a good view of St. Botolph's Church and Corpus Christi College. Corpus should not be passed without going in and looking at the Old Court, which is very picturesque, being all covered with ivy. A little further down the street, we get one of the grandest views in England, namely, King's College. Standing at the corner of Benet Street, we can get the gateway and chapel of King's, the University Library, Senate House, Caius College, and the large tower of St. John's Chapel all on one plate. Benet Street should not be passed without noticing one of the most perfect and interesting examples of Saxon architecture remaining in England, namely, St. Benet's Church, which must be taken with a W.A. lens. In the great court of King's, a capital view of a part of the chapel, gateway, and fountain can be obtained by standing at the south-west corner. The chapel itself is best taken from the west end, and by going on to the bridge, a good view of Clare College and bridge can be had. The University Church, St. Mary's, can be taken from the path leading to the library and also from the Market Place. Caius College stands next; the gateway is worth a plate. Going up Trinity Street, we pass one of the oldest and most antique houses in the town; it is now used as a bank. A little further up the street is Trinity College, the largest in Cambridge. The entrance is most striking, and if taken from the opposite side of the road, makes a fine picture. Proceeding under the gateway, we have before us, it is said, the most spacious quadrangle in the world, the contents of the whole area being 79,059 feet.

The cloisters, library, fountain, and avenue each are worthy of a plate. Its rival college, St. John's, stands next; the subjects in this college should be the street front, the new buildings, and the Bridge of Sighs; this bridge is best taken from the Old Bridge. St. John's College chapel is best taken from the road. The visitor has now before him the Round Church, or Church of the Holy Sepulchre. There are only four of these remaining in England; the best view is from the road. The principal colleges are now passed; turning down Sidney Street, Sidney Sussex College is passed, but a good view cannot be got, owing to the narrow street. Farther down the street we see Christ College; the front is worth a plate, also the large mulberry tree, said to have been planted by Milton, who was educated there, and the tree is always called after him. Emmanuel College comes next, of which the front is worth a plate; there is not anything particular inside, and so passing by we very soon come again to the new Roman Catholic Chapel, where we started. Should the visitor have time to take some interiors, I would suggest these:—King's chapel, Trinity dining hall, Trinity ante-chapel, and library. The interiors of the Round Church and Benet Church are also interesting.

A few more colleges might, perhaps, be mentioned, as the visitor would be sure to find something for his camera:—The colleges of Jesus, Queen's, St. Catharine's, Magdalene, Downing, Newnham and Selwyn, the Halls of Trinity and Ridley.

I think I have now said enough to enlighten an amateur as to the views there are to take; and anyone coming would reap a grand harvest. We have some very obliging professionals who are only too pleased to help an amateur.

In conclusion, I might say that plates of all makes and anything else an amateur will require, may be had at Beal and Son's, Sidney Street, and he will find the assistants most obliging in all information relating to photography. The same may be said of Mr. E. Field, Hill's Road.

Messrs. W. Butcher and Son, of 315, Regent Street, and Blackheath, have sent us one of their illustrated catalogues of photographic materials. The list is very complete, and is provided with a ribbon loop at the corner, so that it can be hung up in the dark-room for ready reference. Messrs. Butcher sell all kinds of apparatus made by the well known makers, together with chemicals, dry or made up in solution. They also quote prices for developing plates, printing, and mounting. The catalogue is a very useful book to have at hand.

Eos Collodio-Chloride Paper is the name of a new printing-out paper made in Denmark, the agents in this country being Messrs. Parker and Co., 288, High Holborn. The paper prints quickly and tones admirably with any of the ordinary toning baths, although a special sulpho-cyanide bath is recommended. A bright surface is easily obtained, and details are well brought out.

## Apparatus.

### LOMAN'S REFLEX CAMERA.

THIS camera is an extremely natty little instrument, and measures 5 by 5 by 6 ins., and weighs, with three dark slides, when filled, 4 lbs. The camera, as will be seen from the illustration, takes the form of a polished walnut box with the lens outside; and a focussing screen of full-size is let into the top, on which the image can be seen the full size and focussed by the rack and pinion fitted to the lens, which is of 5 ins. focus. The action of the camera is simple and very easy. Behind the lens is fitted a mirror at an angle of 45 degs., which projects the image on to the ground-glass, where it is focussed by the rack and pinion. As soon as the picture is seen on the ground-glass as we

desire to see it in the negative, the little brass push on the top is pressed smartly down; this raises the mirror, and as soon as this is raised to a point where it no longer cuts off any part of the image from the plate, the shutter is released and the plate exposed. The advantage of having a finder the full size is great, especially when one desires to turn out successful little pictures. The rack and pinion of the lens enables one to focus from five feet to infinity, or the lens may be worked at a fixed focus. The shutter is of the blind form, working just in front of the plate, and has an aperture of 1 inch; and an exposure from about half a second to the 250th of a second may be obtained by increasing the tension of a spring. One of these cameras was used all last summer by one of our staff with excellent results and gave every satisfaction, and from the one we have examined we consider it an excellent practical form of hand-camera. For those who prefer a more hidden apparatus, a special form is made enclosed in an outer case, and we should strongly advise intending purchasers to see this conveniently arranged apparatus.

Messrs. Loman and Co., the makers of the above camera, have also introduced a separate shutter on the principle of the curtain working close to the focal plane, which can be fitted to any camera, and be obtained to work up to the 1,000th of a second if desired. We shall have a further note on the principle involved in this shutter in a subsequent issue.

## Societies' Meetings.

**NOTE.**—In this column the Editor can of necessity only give a brief summary of the proceedings. Papers read before societies will appear in the PHOTOGRAPHIC REPORTER, and the Editor of the REPORTER will be glad to receive reports for insertion as early as possible after the meetings have been held.

**Belfast Y.M.C.A.**—On the 16th inst the first excursion of the season took place, a number of the members journeying by rail to the historic town of Antrim, en route for Shanes Castle, the residence of Lord O'Neill. Shortly after arrival a storm of hail and snow passed over the town (very unusual at this time of year). On reaching the demesne, brilliant sunshine succeeded, and cameras were soon at work on the old castle, picturesquely situated on the shores of Lough Neagh. After spending a few pleasant hours in the neighbourhood, a return was made to town by the six o'clock train, all agreeing that a visit at no distant date should be made to the same place, which abounds with many beautiful landscapes. The river Main,

town of Antrim, and Massereen Park, lying adjacent, had all to be passed over, owing to the want of time. A local excursion was also arranged, a few members visiting the valley of the Lagan, but the day being stormy proved very unfavourable for river scenery. On Monday, May 26th, the usual monthly meeting was held. The May print competition excited keen interest, a large number competing. First place was obtained by James Pollock with an excellent view, "A Bend of the Lagan;" J. McCleery second, with "The Village of Rostrevor;" and J. A. Hillas third, with "The Glen Whiteabbey." After the usual business was disposed of, the club's enlarging apparatus was brought into operation, and with the aid of the lime-light a number of very successful enlargements were turned out by the members.

**Brixton and Clapham.**—An ordinary meeting was held on the 21st inst., Dr. Reynolds in the chair. Mr. W. H. Powell having been suffering from the prevailing epidemic, had been unable to prepare his lecture on "Hand-camera Work," and it was accordingly postponed. A discussion having arisen as to Alpha paper, the Secretary read the paper by Mr. Howson on this subject in Messrs. Adams and Co.'s "Annual," which was listened to with much attention. Messrs. Hayward, Knights, Palmer, and Reeves were elected members of the club.

**East Southsea** having commenced the summer season, the first monthly meeting was held on the 19th inst. About forty prints were passed round, taken at the first outing, a fortnight ago, at Emsworth. It was decided by the members to visit Portchester the first week in June. Messrs. A. Burt and Guy were elected members of the Society.

**Enfield.**—The annual general meeting of the club was held on the 13th inst., the President, Mr. D. G. Pinkney in the chair. There was a good muster of members. The President, in moving the adoption of the annual report and balance-sheet, referred to the satisfactory position of the club, and considered that the members might reasonably congratulate themselves on the credit balance of £8 15s. on the first year's working of the club. Several members expressed the pleasure they had experienced and the benefit derived during the past season. The President and Secretary, and the Committee (with two exceptions, gentlemen who had left the neighbourhood) were then unanimously re-elected, and votes of thanks given for their past services. One new member was proposed, and it was arranged that the next field-day should be held at Leigh, near Southend, on Saturday, May 30th.

**Faversham.**—The usual monthly meeting of the above society was held on the 19th inst., Dr. Evers presiding, when the certificates gained at the late competition were distributed by the Chairman. Mr. W. C. Stunt (Vice-President), being unable to give his promised demonstration on account of illness, the Hon. Secretary Mr. Percy Dan, gave an impromptu on the same subject, which led to an interesting discussion. The society intend making the first summer excursion to the village of Chilham, about seven miles from Faversham, and, through the kindness of Colonel Hardy, will visit the castle and grounds in the neighbourhood.

**Graphic.**—A largely attended general meeting was held on the 4th inst., Mr. R. Murray (the President) in the chair. After the usual routine business, a programme of excursions for the ensuing session was drawn up, the outing on the 24th June to be the one subsidised by a grant from the Society's funds. It was resolved that each member must give a clear day's notice to the director of the several outings of his intention to be present. Six new members have been elected.

**Holborn.**—A large number of excellent slides were passed through the lantern at the last meeting, on the 22nd inst. The first were by Messrs. Arthur and Lionel Gowing, showing views of Dartmoor, France, Hampton, Hastings, Hampshire, Hertfordshire, Wimbledon, Sandgate, Ipswich, Yarmouth, Folkestone, and of animals in the Zoo. Among them were some excellent sunset scenes, including one entitled "Twilight on the Thames." These were followed by a small set by Mr. Herbert Thompson, and a large set by Mr. R. Plumbridge. Among the latter were some excellent flower studies, and one or two views taken in Australia. The evening was concluded with a large number of slides by Mr. S. T. Chang, including some of the Oxford and Cambridge Boat Race, and a number of views of France.

**Japan.**—At the April meeting Mr. W. K. Burton gave a demonstration of a modified silver printing process. Briefly put, the process consisted in making one solution of nitrate of silver, and another of "salt" (preferably chloride of ammonium), citric acid, carbonate of soda, and a little gelatine. The solutions are warmed and mixed, when an "emulsion" that is immediately ready for application to any surface that can be sensitised, results. The process of making the emulsion, sensitising the paper, and toning prints by Clark's platinum method, was shown. Specimens of finished prints were also shown. Mr. Burton said that the process had not yet been long enough in use to know whether it had any real advantages, but the possible advantages that he saw were that a single solution that would keep fairly well could be prepared in a few

minutes, and was at once applicable to any surface, whereas in all other silver printing-out processes, there were either two operations, that of salting and that of sensitising, or a washed emulsion which was comparatively troublesome to make, had to be used. The process was a cheap one. Mr. West thought the saving of trouble was not great. So far as he could see, the advantage of the process was that it made it possible to get a blacker colour—one more nearly approaching to an "engraving black" than by the ordinary process. Mr. Kajima made two exposures of the meeting by flash light. The proceedings ended with a vote of thanks to the Chairman. The hall was kindly lent to the society by Mr. O. Keil.

**Lewisham.**—A meeting was held on the 22nd inst., Mr. A. H. Miles, Vice-President, in the chair. The result of developing competition was made known, Mr. Hamerton being declared winner. Mr. Bedford Lemere, the judge, congratulated the members who competed on the success they had achieved, the plates being so well developed that it made the judging rather a difficult matter; the negative finally selected being one of six in which there was very little difference. Mr. Davis then gave his flash-light demonstration, showing his own improved apparatus, the advantages being that it required very little magnesium for each lamp, as it was practically all consumed. Any number of lamps can be employed, there being also an arrangement for giving extra top light, adjustable to various heights. After taking two portraits with the apparatus, Mr. Davis was heartily congratulated on its practical utility. Subject for next meeting, June 5th, "The Necessity of Care in all Photographic Operations," by Mr. M. Stodart.

**North London.**—At the meeting held on the 19th inst., the President (Mr. J. Traill Taylor) in the chair, Mr. Weir Brown explained his method of obtaining "Warm Tones in Bromide Prints by Uranium Toning." To obtain the best results he gave a fairly long exposure, and obtained, by slow development, a muddy brown coloured image. After fixing and washing, the print was immersed in a bath consisting of:—Nitrate of uranium, 4 grains; ferridcyanide of potassium, 4 grains; acetic acid, 90 minims; water, 8 ounces. The prints required to be slightly over-toned, as the subsequent washing tended to bring back the original colour. In fact, if continued long enough, the whole of the effect of the toning bath would be removed. Mr. Weir Brown passed round a number of specimen prints in illustration of his remarks. Mr. A. S. Newman read a paper on "High-speed Shutters," in which he pointed out the difficulties to be overcome in the construction of a shutter designed to work at a speed of over one-hundredth of a second, and explained how he had overcome these difficulties in the shutter which he exhibited. He also, by means of diagrams on the blackboard, showed a graphic method of calculating the effective exposure given by various types of shutters. Several questions relative to the subject were asked by members, and replied to. The next meeting will be held on Tuesday, June 2nd, when Mr. J. Traill Taylor will lecture on "Stereoscopic Cameras and Appliances."

**North Middlesex.**—A field-day was organised for Saturday, the 23rd inst., to Hale End and district, when a fair number of the members attended. On the 25th inst., Mr. F. Cherry in the chair, Mr. F. W. Cox gave a demonstration on "Kallitype." He said he had chosen his subject not because he was an advocate for this particular class of paper, but because he believed it would be new to a majority of the members. The paper was coated presumably with a solution of ferric oxalate; this on exposure to light is changed to ferrous oxalate, which reduces the silver salt in the developer and an image in metallic silver is the result. The paper both before and after exposure presents an almost identical appearance to platinumotype paper. Here samples were passed round for inspection. The paper is at least three times as sensitive as silver paper, and therefore all developing operations during daytime must be conducted in weak light. A good negative (not necessarily a hard one) will give best results in this as in other processes, and exposure should be stopped when there is a very faint indication of the densest parts of the negative having printed on the paper. Under-exposed prints will develop very slowly, and over-exposed ones come up mealy and muddy in appearance, and are liable to show stains and markings. In developing, the prints are floated face downwards upon the developer for a few seconds and then placed for a short time upon a piece of clean glass to gain density. Should bubbles appear, a touch with a camel-hair brush charged with the solution will stop any trouble in that direction. The prints are next immersed in clearing baths, and a final wash in water completes them prior to drying (the various formulæ were here given). The bichromate of potash is to give contrast, and a stock solution, 8 grains in 1 oz. of water, should be kept. A drop or two of this added to the developer when thin negatives are printed from will be found advantageous. The process is a cheap one to work, provided, of course, successful prints are obtained, as will be seen by the price list. Due allowance must be made, in judging density and brilliancy, for the wet state of the paper, and with the greatest care and cleanliness stains and markings will sometimes appear. The finished prints range from a bluish

black to a purple black in colour, and I see no reason why they should not be toned with uranium to a sepia colour to suit those who prefer a warm effect. The demonstrator then proceeded to develop the prints he had brought with him both by floating and by painting with the brush. Local development was resorted to, and those who had not previously seen the process worked expressed themselves much pleased with the results obtained. A discussion then ensued as to the exact nature of the metallic image obtained in this and in other processes, widely differing opinions being given. On Monday, June 8th, Mr. J. Traill Taylor will address the Society, when visitors will be welcome.

**Richmond.**—At the meeting on the 22nd inst. Mr. Cembrano presided, and an interesting and valuable demonstration of "Printing on Alpha paper" was given by Mr. J. Howson. After handing round specimens showing the great variety of tone obtainable on this paper, Mr. Howson proceeded to develop and tone several prints, producing red, brown, purple, and black tones, according to the length of time the prints were allowed to remain in the toning bath, time not admitting of the still more prolonged toning necessary to produce a blue. All details of the process were very lucidly explained as the demonstration proceeded, and at its close Mr. Howson replied to the queries of members on points of doubt or difficulty. Field days now take place once a fortnight, but so far have been unfortunately marred by the weather.

**Southport.**—The ordinary monthly meeting was held on the 14th inst., the President, Mr. E. Clough, in the chair. There was a good attendance to hear the annual address of the President. After briefly alluding to the services of the late Council and their efforts for the good of the Society, Mr. Clough drew attention to the new programme for the ensuing season, and appealed to the members to support the new council loyally, without which support and help no success could be expected in the future. Passing from local topics to those of more general interest, the address touched on the different events of interest during the past year—the reversal of the image, photography in colours, the vexed question of the relation of photography to art, and many other questions of interest. The value of the pursuit from the moral, intellectual, and physical point of view were dealt with, and the address concluded with an earnest exhortation to the members to work with such vigour and "go," that, to use a hackneyed phrase, their Society might be "second to none." The evening was filled up by a demonstration of the Platinotype process by the late President, Mr. Harper. Considerable discussion also took place with reference to excursions.

**Southport Social.**—The members, on the 15th inst. had a very enjoyable outing at the Botanic Gardens, Southport, when some very good pictures were obtained. Mr. Cross got a good negative of the members all armed ready for "a shot," and Mr. Kiddie exposed a plate on the members whilst at tea. On the whole, the afternoon was well spent, and future outings are being arranged. The previous meeting night Mr. Dunmore raised a discussion on the management of apparatus in the field, when a lengthy debate followed. On the 20th Mr. Cross gave a good demonstration on "Copying," which was appreciated by a good number of the members. We are glad to note the favourable progress of the club.

**Spenn Valley.**—The first annual meeting of this Society was held on the 12th inst. Dr. Farrow presided, and there was a good attendance of members. Mr. W. H. Wright, the Secretary, presented an interesting report, in which he stated that the Society was formed on January 21st, 1890. The past year had been one of pleasing experience and much active and successful work. The number of members was 38. The subscriptions had amounted to £37 10s., the total expenses to £31 3s. 6d., and there was now a balance standing to the credit of the Society £5 13s. 2½d. The Society's dark-room now offered great facilities and privileges for the furtherance of the art-science, and a lime-light enlarging apparatus had been purchased. The Society also possessed a small library of several standard works, annuals, and other periodicals, all of which had been supplied gratis. Fourteen monthly meetings had been held, and interesting papers had been read. Three excursions had been promoted, and a course of lessons in photographic chemistry had been given by the President. The report was unanimously adopted, as was also a financial statement presented by Mr. E. Smith, the Treasurer. The election of officers was then proceeded with. Dr. Farrow was re-elected President, and Mr. E. Smith Treasurer; and Mr. Eli Hirst was appointed Secretary. The following gentlemen were elected on the Council: Messrs. J. H. Jackson, J. Burnhill, A. H. Knowles, J. C. Phelon, W. Armitage, W. H. Wright, R. Smith, George Potts, and A. Cooper. Several vice-presidents were also elected. The first exhibition of members' work was held the same evening. There was a large display of prints in various processes, enlargements, negatives, and lantern slides, and the exhibition taken as a whole was a very creditable one. The members voted by ballot on the general excellence of the exhibits, and awards were made as follows: Prints, 1st, Mr. J. H. Jackson 2nd, Mr. A. H. Knowles; 3rd, Dr.

Farrow. Enlargements, 1st and 3rd, Mr. Knowles; 2nd, Mr. E. Smith. Negatives, 1st, Mr. W. H. Wright; 2nd, Mr. Knowles; 3rd, Mr. Burnhill. Slides, 1st, Dr. Farrow; 2nd, Mr. Jackson; 3rd, Mr. Knowles.

**Staff Potteries.**—At the monthly meeting on the 12th inst., Mr. R. S. Burgess (President) in the chair, Mr. E. B. Wain gave a demonstration on "Matt-Surface Papers," treating of their preparation, sensitising, toning with gold and platinum, etc. During the reading a number of p.ints on various papers were handed round. As Mr. Wain has made a special study of matt-surface papers, the members had the pleasure of hearing a thoroughly practical and very interesting paper. A vote of thanks was given Mr. Wain; he was also congratulated on his success in the last AMATEUR PHOTOGRAPHER competition.

## Quarterly Examinations in Photography.

**Question 19.**—Describe Warnock's sensitometer, and state your opinion of its reliability.

**ANSWER.**—It may be described as two printing frames fixed face to face with a shutter between. In the one is a negative covered with numbered squares, gradually increasing in density, while in the other is a phosphorescent tablet. The plate to be tested is placed behind the negative, and the tablet is excited by burning one inch of magnesium ribbon, and, after resting a minute (to allow the light from the tablet to become fairly constant), the shutter is withdrawn and the plate acted on through the negative for thirty seconds. The plate is then developed, and highest number visible gives the sensitometer number, each number being one-third more sensitive than the number next below it. The results between plates by the same makers are fairly reliable, but between those of different makers (probably made by different formulæ, and possibly sensitive to a different part of the spectrum) are not to be depended on. Further, as the aim of a photographer is the gradation of tone, and it is possible that a plate with a high sensitometer number may have a very short range of tone (the lower numbers being one uniform density), while another plate with a slightly lower number may have a long range, the latter plate would, in spite of the sensitometer, be the better. S. N.

**Question 20.**—What is an actinometer, and can the results of such an instrument be relied upon?

**ANSWER.**—Actinometers are instruments for measuring actinic force, and may be divided into two classes, according to the purpose for which they are used—

1st. For calculating exposures. These are a box with means for exposing a small piece of sensitive paper, the time required to darken to a certain tint being noted, thus giving the ratio of the time necessary. Either ordinary silver paper or bromide paper

dipped in nitrite of potassium, which being the same salt as the plate is preferable, is used, but not being the *actual time* of exposure (the conditions in this climate changing so quickly) the results can only be used as a guide.

2nd. For estimating the time required for printing in cases where there is little or no visible image, as platinotype and carbon processes. In this case a piece of silver paper is exposed under a glass plate covered with a series of squares or negatives increasing in density. Being exposed during the time printing is progressing, they register the light passing through a negative of similar density, and slight allowance being made for the different sensitive salts, they may be considered fairly correct.

**Question 21.**—Give a table showing the relative photographic activity of sunlight, lime, magnesium (ribbon and flash), gas, and petroleum.

**ANSWER.**—Sunlight varies so much, according to the altitude of the sun and the state of the atmosphere, while the different artificial lights depend so much on the way they are produced, that very little value can be placed on any table. Calculating, however, from experience obtained in enlarging, I find, using Mawson's bromide paper, *f*/22—

		Ratio.
Sunlight (bright), mid-day, summer, required about	10 sec.	1,200
" (dull) .. .. .	20 "	600
Limelight (oxy-spirit) .. .. .	6 min.	33
Electric (arc) .. .. .	3 "	66
Magnesium (ribbon) .. .. .	2 "	100
" (flash) .. .. .	"	"
Gas (argand) .. .. .	98 "	2
" (Bray's No. 5) .. .. .	150 "	1½
Petroleum (triple-wick lantern) .. .. .	50 "	4
" (circular burner) .. .. .	200 "	1

The time of the last four is obtained by calculation, the aperture I use with them being *f*/16.

In the case of daylight and magnesium a ground-glass diffuser is used, while with the other lights a condenser is employed, which may slightly alter the ratio. S. N.

**"Practical Amateur Photography,"** by C. C. VEVERS. Another edition of this useful little handbook has just reached us, and it is as complete as ever. It gives all the information necessary to the beginner, and is illustrated with cuts of the requisite apparatus, the greater part of which can be supplied from Mr. VEVERS well-known specialities.

**Mr. A. E. Western** writes:—"I want to thank you heartily for your 'Annual,' which has been of great assistance to me. The book is so beautifully complete, and therefore more useful than any other book on photography I have seen. I am sure it will have a great and permanent success."

## The Amateur Photographer's Tourist Index.

Back Numbers, Post Free, 3d.

THE "Tourist Index" gives references to back numbers of the AMATEUR PHOTOGRAPHER which contain Articles on "Holiday Resorts and Photographic Haunts," and in addition many other items of interest to the "Tourist Photographer" given in "Answers" or "Letters."

The Editor will be glad if ladies and gentlemen will kindly contribute short articles upon any places of photographic interest which may not be included in the following "Index":—

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4708. **Hand-Camera.**—I wish to purchase a good hand-camera, quarter-plate. The negative must be good enough for enlarging up to at least 10 by 12, and for making lantern slides. Can anyone recommend a make? Is the Talmer good enough for these purposes? I shall be much obliged for information. **M. A.**

4709. **Central Africa.**—Could any reader inform me (1) the best films to use in Central Africa (Uganda), (2) the best developer to take, (3) the best paper and printing process for use out there? Please remember that lightness of materials is of very great importance.—**C. M. S.**

4710. **Focussing Screen.**—Can anyone inform me if it is possible to alter an ordinary glass focussing screen so that celluloid can be used in place of the glass, and also if the celluloid can be made to lie flat?—**CANADA.**

4711. **Photinus Oil.**—Can any of your readers who have tried this oil for the optical lantern corroborate the advantages claimed for it, viz., that it has neither "smell nor smoke"?—**J. R.**

4712. **Retouching.**—Will someone kindly tell me if it is necessary to use the medium in all cases when retouching, say, small spots on face? Could they not be removed by marking on the spot with retouching pencil? Also which is the best way to apply the medium? Would a soft hair brush do, or must it be poured on in the same manner as when varnishing a plate?—**G. H. E.**

4713. **Stickpaste.**—Could any reader of the **AMATEUR PHOTOGRAPHER** inform me if there is any chemical of any description in stickpaste which will do harm to prints mounted with it; if so, what chemical, and which is the best mountant now used for mounting prints? A hint will oblige.—**W. H. ELLIS.**

4714. **India.**—I am going to India shortly, and intend taking my camera. Would any reader who has practised photography there kindly tell me what quantity of chemicals to take out with me? Any hints will be gratefully received.—**E.** (address with Editor.)

4715. **Optical Contact.**—Can any amateur friend inform me how to bring prints in contact with glass?—**M. H. S.**

4716. **Reducing.**—I am about to make a simple reducing apparatus for lantern-slide making (from half-plate size), wherewith to use my ordinary Wray's R.R. lens of  $\frac{3}{4}$  in. focus. At what distance from negative must I fix my lens (say to diaphragm slot), and what length of camera do I require from thence to the lantern plate?—**ROBIN.**

4717. **Switzerland.**—Will anyone kindly give me an idea of exposure on the Lake of Lucerne (Brunnen for head-quarters) during June and July? I use Eastman's roller films, and in England find Wormald's tables a great help. Would they be of any use abroad, and what would the average difference of time be—half, quarter?—**T. T. S.**

4718. **Hire-Purchase.**—Can anyone tell me where I can obtain Lancaster's and Underwood's cameras on the hire-purchase system?—**JOAN.**

4719. **Rough Surface on Negative.**—Most of my negatives, on drying, are found to have a rough, uneven surface and a white, powdery matter nearly all over the film. What is the cause of this, and how can it best be remedied?—**L. S. S.**

4720. **Hand-Camera.**—Can Lancaster's quarter-plate Instantograph with shutter be used as hand-camera? If it is possible, how is it to be done? Are lens and shutter quick enough? Any hints will greatly oblige.—**SWISS.**

4721. **Instantograph Lens.**—When taking some high buildings with Lancaster's quarter-plate Instantograph, about half an inch along the top of the negative was fogged on several plates. Does the lens not cover the plate, when using the rising front to its full extent?—**SWISS.**

4722. **Toning Bath.**—When toning with following bath—Borax,  $\frac{1}{2}$  oz.; gold, 2 drms.; hot water, 18 oz.—I only succeeded in getting about twenty prints toned within four hours; then the bath almost refused to act. I added  $\frac{1}{2}$  drm. more gold solution; that toned a few prints more, but exceedingly slowly. Would anybody kindly help me? I kept the bath tepid, but the gold precipitated, nevertheless, quickly.—**SWISS.**

4723. **Tenby.**—I propose making a short stay in Tenby, South Wales, during the coming summer, and shall be glad to learn, through the **AMATEUR PHOTOGRAPHER**, any places of interest in the neighbourhood, and, if possible, a few notes as to light (say during August and September).—**W. J. CABLE.**

4724. **Metal Slides.**—Will someone who has used Tylar's metal slides kindly say whether he can recommend them as in all respects satisfactory?—**E. H. K.**

4725. **Bromide Paper.**—What is the proper way to expose bromide paper? Hitherto I have always done it this way: Place a piece in the printing frame in the dark-room, cover the frame over with a coat or a piece of cloth, then take it to the nearest gas burner, pull off the coat, and expose. Directly the exposure time is up, replace the coat, take back to the dark-room, then take out the paper and develop. It will be seen from this that there is no gas burner in my dark-room. I cannot possibly put one there. **A. GROVES.**

4728. **Exposure.**—What exposure is necessary in a diffused light for a group, using Dallmeyer's triple achromatic lens with medium stop?—**KENDAL.**

## QUERIES UNANSWERED.

May 1.—Nos. 4647, 4648, 4653, 4654, 4655, 4657, 4658, 4659.

" 8.—Nos. 4668, 4671, 4674, 4675.

" 15.—Nos. 4679, 4686, 4688.

" 22.—Nos. 4692, 4694, 4698, 4699, 4705.

## ANSWERS.

4667. **Testing Shutters.**—It is just this way. You make a white mark on the rim of the wheel and then turn it till it has acquired a speed of one revolution per second. You then expose, and on development you will find that there is a black line on the rim of the wheel (corresponding to the white mark aforesaid), which will, of course, vary in length according to the length of the exposure. Now see what proportion of a complete revolution the white mark moved through during exposure as indicated by the length of the black mark on the negative. The fraction representing that proportion will indicate the speed of the shutter. For instance, if the black mark on the negative is one-eighth the circumference of the wheel, then it is plain that the white mark made one-eighth of a complete revolution during the exposure and, therefore, the speed of the shutter is estimated as one-eighth of a second.—**H. LEACH.**

4680. **Westminster Abbey.**—I am sorry I missed this query last week and, if not too late will reply now. The entrance to Henry VII. chapel, looking east, being very dark, required an exposure of 45 minutes on a bright day in April; plate, Ilford ordinary; stop,  $f/32$ ; and the lighter portions were not overdone, in fact, you can hardly over-expose here where you have any part in deep shadow. Plates must of course be backed. I may just remark that the usual card to make sketches will not allow you to take photographs of the interior of the Abbey, for this special permission has to be obtained from the Dean. The newly restored north front, from which the scaffolding has recently been removed, is, however, well worth a visit, and this can, of course, be taken without any special permit.—**EDYLLION.**

4682. **Silly Islands.**—Mr. T. Ford should write to J. C. Tonkin, bookseller, Hugh Street, St. Mary's, Scilly, for a copy of Tonkin's "Guide Book to the Silly Islands," price 1s., postage 1d. It contains much information and a good map. Hotels: Tregarthen's is a comfortable house, apt to be overcrowded during season (July to September.) Holgate's Hugh House Hotel is larger, but not so select. Other and cheaper accommodation is available. The coast scenery is very good. Boating costs from 10s. a day and is, practically, the only form of amusement. The sub-tropical gardens of the lord proprietor on Treco Island are unique and well worth seeing. The best view of the archipelago is obtained from the Semaphore Tower (coastguard station) on St. Mary's. I do not know of a dark-room nearer

than Penzance. A trustworthy hand-camera, worked on a firm tripod, should give good results. Focussing-cloths are likely to give trouble in the perpetual driving wind.—**BEDFORDSHIRE.**

4683. **The Dukeries.**—Workshop would be the most central point at which to stay. My agent, Mr. Haslam, would give permission to photograph Olmberg, and probably it could be obtained also for Thoresby and Welbeck from the respective agents. Besides these places many charming views could be obtained in Sherwood Forest; and Roche Abbey, a beautiful ruin, is about fifteen miles from Workshop. Any further information would be given by Mr. Booth, photographer, Workshop.—**NEWCASTLE.**

4684. **Septia Tones.**—I should think "Duplex" could obtain very good septia-toned prints from the Septiatype paper which can be purchased at any photographer's at the following prices, viz., quarter-plate, 7d.; half-plate, 1s. 3d.; cabinet, 1s. per dozen sheets. This paper requires a very little time and trouble. There are only three processes, viz., (1) Soak the print for ten minutes in cold water, (2) then put the print for a few minutes (10) in a bath of hyposulphite of soda (saturated solution), (3) then again put the print in water for 20 minutes, so as to be sure there is no soda left in the print. The prints can then be dried by either blotting, hanging up, or by the fire. This paper requires a little longer exposure than the albumenised papers.—**W. H. ELLIS.**

4684. **Septia Tones.**—I think "Duplex" would find, for septia tones, the following suit him very well, and which I have used with great success myself, and with certainty. Take a print of a negative on thick bromide paper, and develop the same with either hydroquinone or ferrous oxalate up to nearly the required density, then clear wash, etc., as usual. I then take Wood's uranium intensifier; to 1 oz. of this add  $\frac{1}{2}$  oz. of water, then lay the bromide face up in this, when the print will very rapidly change to a beautiful septia; in fact, I have some thus treated that can scarcely be detected from septia paintings. Great care, however, is required to take out the prints just as the required tint has appeared, as, if allowed to go on, a reddish hue will be the result. The prints should then be washed until the whites are pure, and then allowed to dry.—**F. YOUNG.**

4690. **Omnigraph.**—This is very fair at the price, and, doubtless, good work can be done, but it is best to pay a little more and get a better one.—**ERKO.**

4691. **Toning Bath.**—Evidently you do not print deep enough. Try:

Tungstate soda	...	...	...	30 gr.
Water	...	...	...	8 oz.
Gold	...	...	...	1 drm.

Dissolve soda in 3 oz. boiling water, add gold, and after five minutes, rest of water. Use at once.—**ERKO.**

4693. **Covering for Hand-Camera.**—What "J. W. W." wants is not leather, I think, but a kind of American cloth, which can be obtained at No. 18, Tottenham Court Road, for 1s. 3d. a yard.—**S. M.**

4693. **Covering for Hand-Camera.**—You might get morocco or other leather suitable for your purpose at a saddler's or shoemaker's, or try Drew, the bag and portmanteau maker. I should say you could make a good job of it by means of glue and a squeegee.—**PONTO.**

4695. **Lens.**—No difference whatever. The lens would cover, but it is best to stop down a trifle.—**ERKO.**

4696. **Antwerp.**—The best and cheapest house "A Rather Nervous One" could go to is Parker's Temperance Hotel, 10, Rue de la Digue, Antwerp. The charge is 5s. a day. He will have no difficulty in making himself understood, as it is an English family which keeps the Hotel.—**BELGICA.**

4696. **Antwerp.**—"A Rather Nervous One" cannot do better than stay at the Hotel de Hollande. It is close to the quay. The son of the proprietor, Mr. Joseph Stroobants, speaks English well, and will be most happy to give him any information about places worth photographing, etc. There is no difficulty about the customs. I spent about ten days at that hotel, and was most comfortable. My expenses were about 10 francs a day. English money is taken at the hotel. "A Rather Nervous One" can mention my name if he likes.—**W. J. BARTON.**

4696. **Antwerp.**—Can recommend the Hotel Vieille Tour, opposite the Cathedral. Proprietor used to be at Critterion, and speaks English. His name is Blaens Vanden Eynde. Terms very reasonable. Money is same as the French decimal coinage. Van Neck speaks English and his man does, so that you could easily understand. You can photograph anywhere pretty well in Belgium just the same as in England. The customs house is easily got through. They ask you if you have anything to declare—"rien a declarer"—and you pass through. They are very polite, quite a contrast to our customs officials. English spoken nearly everywhere in Antwerp.—**ERKO.**

4696. **Antwerp.**—In company with my wife and a relative I visited Antwerp last July. We stayed with Mrs. Lewis, Avenue du Commerce, for two days and were well pleased. Her charges are moderate

—3s. for bed and breakfast. The house is thoroughly clean and comfortable, and as she is English, this is a great convenience to anyone, who speaks nothing else. "A Rather Nervous One" will find her address in the Continental time table of the Great Eastern Railway Company (sent post free). I may say that this was part of a pleasant six days spent in Holland and Belgium, and the entire cost of the trip, everything included, was only six pounds. As regards the language, no difficulty will be experienced on this point, as at most of the public places English is spoken. Get a good guide book, read up before going, and I can guarantee your enquirer an enjoyable holiday. If I had time and space I would gladly give a more detailed account, but if "A Rather Nervous One" desires any further particulars I shall be glad to send them. Editor has my address.—DARWEN.

4697. **Views, Where to Get.**—"N. M. H." I should think, could find six, if not more, good half-plate views, without walking a very long distance, at Highgate and Hampstead (including Parliament Hill Fields, from which a very good view can be obtained of both Highgate and Hampstead and Hampstead Heath), or at Pinner, or in any of the parks and gardens (provided he or she has a licence to take photographic views in Royal parks and gardens, which can be obtained from H. W. Primrose, Esq., H.M. Officer of Works, Whitehall Palace, S.W., available for six months).—W. H. ELLIS.

4697. **Views, Where to Get.**—Richmond, Kingston, Hampton Court, Hampstead, Epping Forest, Croham Hurst, Osterham, Carshalton, Pengehurst Castle and village, Cuckfield, Hayward's Heath, Sevenoaks, and Knockholt Beeches, with Knole Park, would perhaps suit.—PONTRO.

4700. **Pickard's Exposure Meter.**—Very good, works with Ilford's (slow), Fry (ditto), Mawson's Castle. All good plates. Preference is given by the writer to Wormald's exposure tables, as nearly all exposure meters are troublesome and indefinite.—EIKO.

4701. **Shutter.**—With a very weak band made by tying the ends of a piece of elastic pulled out of an old elastic garter, I have obtained an exposure of one-third second. In this case the elastic was stretched from the knob on arm to the central pivot, and then pulled down over the knob of shutter, so that the elastic only acts during about one quarter of the revolution.—PONTRO.

4702. **Focal Length.**—The focal length of Lancaster's quarter Instantograph lens is  $\frac{1}{2}$  ins. The largest aperture,  $f/10$ .—PONTRO.

4702. **Focal Length.**—Focus something over 30 ft. away, and measure distance from lens (if single) to focussing screen and you obtain your focal length.—EIKO.

4703. **Developer, Eikonogen.**—Try Beach's for bromide work, which is:

A.	
Eikonogen	... 1 drm. 4 gr.
Sulphite soda	... 2 " 8 "
Water	... 4 oz.

Dissolve soda first.

B.	
Carb. potash	... 168 gr.
Water	... 1 oz.

For use, to make 4 oz.: Take 3 oz. A, to which add  $\frac{1}{2}$  drm. B and 1 oz. water. For ordinary work use Warnerke's, which is:

Sulphite soda...	... 40 parts.
Distilled boiling water	... 100 "
Eikonogen	... 20 "
Caustic potash	... 20 "

For use, 1 of above to 3 of water.—EIKO.

4704. **Channel Islands.**—If S. L. Coulthurst will communicate with me (address with Editor) I shall be most happy to give him the benefit of my experience, collected in a life's sojourn in the Channel Islands.—SARNIA.

4704. **Channel Islands.**—Jersey, the largest, should be visited first; Guernsey on the return home in the usual order. Excursion cart runs to all parts of the Islands, and it will be better to inspect the route lists when you are there. De Faye, Photographic Chemist, 21, David Place, St. Helier, Jersey, has two splendid dark-rooms, and also large selection of plates, paper, and chemicals. Colliette, Chemist, of Guernsey, is also a photographic chemist.—C. G. ELLETT.

4706. **Permission to Photograph.**—It is rather impossible to say how many plates you can expose—that depends on your taste. To make sure of your passes for parks, write as follows: Royal parks, etc., H. W. Primrose, H.M. Office of Works, Whitehall, S.W.; parks and spaces under County Council, H. de la Hooke, Spring Gardens, W.C.; Wanstead and Epping Forest, Sir John B. Monckton, Guildhall, E.C. For Kew Gardens you must write to the Director, Kew Gardens.—EIKO.

4707. **Lewis, Island of.**—There is no "Island of Lewis." Lewis, or the Lews, is the northern portion of the Long Island, Harris being the southern. I should decidedly advise "Q" to take with him everything he will need. The finest scenery is in Harris, but there is no lack of interesting subjects anywhere.—DUPLEX.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

J. RIDGWAY.—Use 80 gr. of sodium hydrate. We have inserted your query this week.

W. T. BARTON.—The borax bath will keep better than the acetate.

Gold chloride	... 1 gr.
Borax	... 20 "
Water	... 10 oz.

The tube of gold should be broken in a bottle containing 15 drm. of distilled water, and kept in the dark. It can then be used for mixing any bath. In the acetate bath the gold should be neutralised with a pinch of chalk. One fixing bath is sufficient, made up of hypo, 2 oz.; water, 1 pint. You washed the prints much too long; one hour would have been quite enough.

O. A. K.—The only qualification is respectability, love of the art, and election by the club. The nearest would be the Holborn Camera Club (Secretary, J. E. Smith, 97, Tableday Road, Tufnell Park). There are meetings for beginners.

W. T. BARTON.—The camera you mention is a very good one, and would meet the points you mention. There is also the Reflex, which uses dark-slides.

G. L. BARKER.—The Chronolux is a very good shutter, and will, we should think, fully answer your purpose.

W. S. M.—We are afraid we cannot help you. There must be some misunderstanding at the other end. We have forwarded your letter to the maker.

W. WILSON MERCER.—We sympathise with you, but fear nothing can be done beyond waiting until the order is completed. We note the other point in your letter.

LOOK PLEASANT.—D would, perhaps, be the best. We should say the aperture in the shutter would be too small. We should recommend an Underwood or other blind shutter, working in front of the lens.

J. E. GARTSIDE.—We shall be pleased to tell you what it will cover if you will send it to us.

PEBBLEDIDGE.—Hackney Phot. Soc.; Phot. Soc. of Great Britain; the Holborn Camera Club; and we believe the West London Phot. Soc.

E. D.—We should recommend either 2 or 3; there is little if any difference between them.

W. E. K.—It is to be obtained of Mr. Cusworth, Leytonstone.

W. H. WHITTARD.—We hope it will be published next week; the medals are being engraved, and will be sent as soon as received.

THOS. H. BISHOP.—We know nothing better than Mr. Chapman's formula given in the answers to correspondents, in the number for March 13th. We should not use a smaller stop than  $f/8$ . The negative arrived in numerous pieces, but as far as we can judge it is under-developed.

E. A. P.—A carbon enlargement on opal would be as satisfactory a method as you could adopt, and it is quite permanent. It has also the advantage of offering a choice of colour.

INVENTION.—We do not know of any book on the subject you refer to.

J. C. J.—We should say most certainly. Several of the photographs exhibited last year had previously been entered in the AMATEUR PHOTOGRAPHER competitions.

FRITHIOF.—Thank you for MS. "Grange-over-Sands." Which we shall use shortly.

B. WHITBROW.—The MS. "Winchester" will be published in due course. Many thanks for the same.

A. H. BLAKE.—Your photographs are well up to competition standard, and Nos. 2, 3, and 4 show much care in composition. In No. 1, the two straight lines of the old man and his staff on one side, and the upright post of the foot bridge are stiff and formal. We return the prints, and are much pleased with them. The best is No. 4, which is an admirable picture.

T. H. P. H.—Lancaster's Omnigraph will answer your purpose admirably, is well made, and capital value for the money.

R. S. TREILIAN.—Well advanced; date will be fixed very shortly.

S. JAMES.—None of the photographic journals gave lengthy reports upon the photographs exhibited. Entry forms have been sent you.

W. GILL.—We publish your letter in another column.

G. BUTTERWORTH.—Many thanks for your letter. We shall hope to see some of your work at an early date.

PATIENTLY WAITING.—The treatment you have received is very annoying, but we make a rule not to take any action in such matters. Send your complaint to the Photographic Dealers and Manufacturers' Association, 7, Southampton Row, W.C. The Society was formed to redress the wrongs of buyer and seller, we believe.

H. S. W.—Your measurements are wrong somewhere, we think. Measure all your diaphragm apertures and work them out, or else send us up the lens.

ASPIRANT.—(1) This sitter is evidently suffering from influenza; the image is too low on the plate. (2) The vignetting is very poor, lighting fair. (3) The negative is slightly over intense in the high lights and much too strong a reflector has been used. (4) Good; though this might be improved by a little yellow matt varnish on the back of the negative so as to lighten the shadow of the nose, in fact the whole of this side might be lightened a little. (5) A good portrait spoilt by the background being too light; a deeper tinted grey would have given a fine result. You would get a better lighting by placing your sitter more at an angle with the window; full-face lighting is hardly ever conducive to anything but flatness.

A. BEGINNER.—For ordinary work we should choose either 4 or six, then 3, 5, 2, 1; for instantaneous, 2 or 5, then 8, 4, 3, 1.

AMATEUR.—The probable cause of the yellowness of the print is the long washing prior to toning, which may be obviated by washing in salt and water, and then using fresh salt and water after toning and making your fixing bath 3 oz. to the pint, and adding  $\frac{1}{2}$  oz. of carbonate of soda to the pint. It is never advisable to keep sensitised paper in a closed receptacle with any chemicals.

GOAT.—(1) Out of focus, fogged in developing. (2) Fogged in developing. (3) Out of focus, not printed deep enough. (4) Out of focus, fogged in developing. (5) Over-exposed, out of focus, fogged in developing. (6) Ditto. (7) Ditto. (8) Under developed, under printed. (9) Under printed, over toned. (10) Group not sharp all over, under printed, and over-toned. 7, 8, 9, and 10 are mounted on common cardboard, the colouring of which has bled through the wet prints. This is as sorry a lot of prints as we have ever seen. You had better expose a plate and send it up to us and we will develop it and print from it and let you see the results. You are evidently in want of knowledge of the very first principles of exposure, development, etc.

C. H. SMITH.—It is very difficult to obtain black prints with albumenised paper and the toning bath you use. Try printing under green glass and using the combined uranium and gold toning bath recommended in this column last week.

HENRY F. FOY.—The table you give may be used as a very fair basis to work upon.

W. H. WARDLE.—We have sent you introduction by post. Your print is hardly a fair standard to judge your work by as child photography is extremely difficult. Let us see some of your landscape work on your return from the Isle of Wight.

R. L. HENDERSON.—We certainly should not recommend you to use the bath as in our experience it never does give good tones and pure whites. You might try the following:

Hyposulphite of soda	... 3 oz.
Nitrate of lead	... 3 gr.
Chloride of gold	... 6 "
Distilled water	... 20 oz.

Place the prints in this without previous washing.

UPA.—(1) Yours is not a so-called triple achromatic but a triplet lens, for a note on which see the reply to F. C. Barton in our Editorial column, May 15, p. 382. We cannot accurately state the ratio aperture of your diaphragms, but they should be  $f/10$ ,  $f/12$ ,  $f/15$ ,  $f/20$ ,  $f/22\frac{1}{2}$ ,  $f/30$ . (2) The camera named has turned out some very good work, but we have never used it.

BLACKPOOL.—The glass for squeegeeing aristotype on to should be polished with French chalk or else some solution of wax and resin in turpentine rubbed all over and polished with a clean pad. You give us no details as to the print you enclosed, but probably the white spots are due to some sulphur compound bleaching the image.

DELTA.—Considering the disadvantages you work under, you are turning out very fair work. In the first place, it is advisable to use a rapid plate; this would enable you to give rather shorter exposures, and to obtain rather softer results. As to the prints, they are nearly all of them suffering from false lighting, in that you have used too powerful a reflector on the shadow side of the face. This fault is very marked in Nos. 5, 3, 2. (1) Very fair; the light is a little too strong on the hand, and not quite enough on the face. (2) The false lighting on the ear and side of the face detracts from this. (3) Ditto. (5) Poor; much too strong a top and front light to allow the neck and ear to be so strongly illuminated. (4) Good; only this sitter's eyes are not quite level, consequently it is very plainly seen in the full-face print; the left eye should be the further away from the camera, so as to hide this nature's exception to the law of symmetry as far as possible, but for this, the portrait is the best you have sent. We should advise you to use pyro and ammonia, and if you like to send us a sketch of your room, with dimensions marked, we will give you some hints as to what we think the best position for sitter. Let us know what your exact difficulty is with regard to toning, and we will write you privately. Your retouching is very good considering you have had no lessons, and you ought to get on, and we shall be pleased to do all we can to help you.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**"Amateur Photographer," etc.**—AMATEUR PHOTOGRAPHER, vol. i. to vol. xiii., a few copies wanting; what offers? — M. Mackenzie, 2, McKerrall Street, Paisley.

AMATEUR PHOTOGRAPHER, March, 1888, to December, 1890; offers? apparatus preferred. — S., 52, Greenhill Street, Manchester.

**Backgrounds.**—Canvas background, interior, 6½ ft. by 6 ft., 5s.; folding lamp, for oil or candle, 3s.—J. Walsh, 61, Queen's Park Road, Blackburn.

**Bicycle.**—Bargain. For sale, splendid diamond-frame safety bicycle, cushion tyres, balls all over, including pedals, only bought new month ago, and warranted perfect; take £7 15s.; rare opportunity for anyone wanting bargain; approval.—Cyclist, 18, St. Helens, Ipswich.

**Cameras, etc.**—Stereoscopic Co.'s 8 by 5 camera, tripod, four double backs, travelling box, leather case, printing frames, dishes, etc.; 5 guineas; appointment.—A. Wigginton, 45, Abingdon Villas, W.

Enlarging camera, Lancaster's Multum-in-Parvo, enlarges up to 15 by 12, new last January; price 28s.—F. Holmes, French Embassy, Albert Gate, S.W.

Sands and Hunter's patent Imperial 8½ by 6½ plate camera, patent swing reversing frame, extra long focus, all modern improvements, quite as good as new, in fine leather case, and three double slides; cost £13; price, a bargain, £8.—Mitchell, Oscar House, Lewisham.

Lancaster's quarter-plate 1890 Instantograph, with double set of appliances, new six weeks ago; £3.—Roberts, 107, Englefield Road, Canonbury, London.

Whole-plate camera, strongly brass-bound, three double backs; £6 6s.—S., 5, Park Road, Crouch End, N.

**Cameras, Lenses, etc.**—For sale, the property of a private gentleman, all in good condition; offers requested; may be seen at Stanley's, 13, Railway Approach, London Bridge, S.E.: Whole-plate bellows camera, one single and three double backs, Dallmeyer lens 3D, 7½ by 4½ bellows camera, with one single and six double backs, one light sliding tripod stand, two plate boxes, 7½ by 4½, and six light-tight ditto, three 5 by 4 plate boxes and two light-tight ditto, one 3½ in. lantern condenser, also a quantity of dry plates and good apparatus for electrical experiments.

Watson's Acme half-plate camera, three double backs, brass-bound, Eastman's latest roll-holder, specially fitted mahogany shutter, Ross's 8 by 5 rapid symmetrical lens, Sands and Hunter's shutter, travelling case, and sundries, almost new, cost over £28, price £20, or separately; also Luzo detective camera, square pictures, £2 5s.; cost £4 12s.; approval; deposit.—No. 162, AMATEUR PHOTOGRAPHER office, Creed Lane, 1, London, E.C.

12 by 10 best new camera, with three double slides (by Mason), in two leather cases, quarter-plate ditto (by Wainwright), with 5 by 4 Optimus lens, three slides, in leather case.—Finnart House, Ballantrae, Ayrshire.

Lancaster's quarter-plate Instantograph, three double backs, all brass-bound, shutter, instantaneous lens, and tripod, good as new; take 55s.; cost 69s.—Address, Abery, Sandgate, Kent.

8 by 5 bellows-body camera, swing back, landscape lens, tripod, and three double backs; lot 30s.; no approval; photograph and particulars sent; double backs alone cost 18s. each.—Frederick Sharpe, Oakham.

Half-plate camera, every movement, three double backs, best Spanish mahogany, in solid leather case, Ross's No. 4 portable lens, changing bag, best ash tripod, Newman's instantaneous shutter; anyone wanting first-class goods, a bargain; £12 10s. the lot; camera alone worth the money; also lot of chemicals, dishes, frames, etc.—F. Knight, 13, Albion Street, Leeds.

Half-plate bellows camera, movable stereoscopic partition, four double backs, 75s.; half-plate rectilinear lens (R. Reynolds and Branson's), 35s.; pair Optimus 5 by 4 rectilinear lenses, 55s.; 15 by 12 rectilinear lens, Waterhouse stops, 80s.; stereoscopic shutter and camera case, 9s.; three Tylar's half metal backs, 5s.—Kilburn, Eastfield, Batley Carr, Dewsbury.

Whole-plate long-extension camera, brass-bound, three double backs, Optimus 9 by 7 rapid landscape lens, Thornton-Pickard time and instantaneous foreground shutter, telescopic tripod, complete in solid leather case, all in new condition, the property of an amateur; price, a bargain, £10.—May be seen at Walter Tylar's, 48, Waterloo Road, S.E.

Quarter-plate London-made camera, conical bellows, all movements, three double backs, and six

Tylar's metal slides, rapid rectilinear lens, 'shutter', and tripod, all in good condition; price £4 5s.—F. W. Dadd, 192, Mare Street, Hackney.

Lancaster's quarter-plate Instantograph, Optimus R.R. lens, three double backs, stand, etc.; 50s.; or exchange for Kodak.—Hummel, 2, Thomas Street, Newcastle.

Quarter-plate Sciopticum camera and six double backs, in case, fitted with Ross's No. 2 portable symmetrical, in perfect order, very light; cost £8; price £4 10s.—Higginson, 2, Carlyle Villas, Venner Road, Sydenham.

A genuine bargain. In return for five 20s. postal orders I will forward, securely packed, half-plate leather bellows camera (by Watson, Holborn), as new, three double book form slides, every movement, mahogany tripod, Lancaster's half-plate Instantograph lens, with shutter; not sent on approval, but money returned if not found as represented within three days.—T. Gamson, 77, Essex Road, Islington, London, N.

Half-plate 1891 Lancaster's Instantograph camera, dark-slide, tripod, f/8 R.R. lens; bargain, 72s.—53, Slad Road, Stroud.

Lancaster's Instantograph, half-plate, with two double backs, lens, shutter, and stand, new last season; £3 10s.—F. Kirby, Chemist, Abington Street, Northampton.

Lancaster's half-plate 1891 Instantograph camera, with rapid rectilinear lens, double dark-slide, tripod, new; price only £5; worth nearly double; letters only.—Romus, 27A, Farringdon Street, E.C.

Whole-plate Optimus wide-angle camera, one double slide, latest improvements, sliding tripod, new, £6 6s.; whole-plate Taylor and Hobson's R.R. lens, Iris, new, £3 19s., warranted.—8, Montford Place, Kennington Green.

Quarter-plate camera (by Lawley), leather bellows, good condition, six double backs, and lens, 27s. 6d.; sliding-body mahogany camera, with back, 5s. 6d.; half rebounding shutter, 1s. 6d.; Decoudun photometer, 4s. 6d.; Magazine hand-camera, takes 24 quarter-plates, lens, shutter, complete, 32s. 6d., cost 42s.—Greene, 47, St. John's Villas, Upper Holloway, London, N.

Lancaster's quarter International, three double slides, tripod, lens, and shutter, splendid order, 47s. 6d., complete; also Lancaster's combination Rectigraph, 21s.—F. J., 4, Farquhar Terrace, Upper Norwood.

Underwood's half-plate Exhibition patent camera, perfectly new, stand, pneumatic release shutter, three double backs, Optimus lens, in waterproof canvas case; £6 15s. only, complete.—Wells, 114, High Street, Kingsland.

**Dark Slides.**—Two quarter-plate double dark-slides, for Lancaster's Instantograph, nearly new; 10s. 6d.—Dodson, 58, Hornsey Road, London.

Two double slides, to fit Lancaster's half-plate Instantograph; will exchange AMATEUR PHOTOGRAPHER from 228 to present time, good condition; part cash.—Walton, School House, Rawlinson Street, Barrow-in-Furness.

Three Lancaster's double metal slides, with adapter, for quarter Instantograph, perfect condition; cost 10s.; sell 6s.—Lemarchand, Richmond Park Road, Kingston.

**Hand-Cameras, etc.**—For sale, Abraham's Ideal hand-camera, new last year, very little used; price £3 15s.; cost £5 15s.—Address, Mons. Seavy, 164, Camberwell New Road, London, S.E.

Handsome mahogany hand-camera, Lancaster's lens, takes 5 by 4 plates, with carriers; price 35s.; a bargain.—Frederick Sharpe, Oakham.

5 by 4 hand-camera, with rack and pinion, two finders, six Blair's feather-weight double backs, no lens, £3; Instantograph quarter-plate, with Ross's lens, £1 10s.—No. 163, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Hand-camera, Swinden and Earp's, best in market, for 20 quarter-plates, with walking-stick tripod and 10 dozen plates; £7 10s.—F. Knight, 13, Albion Street, Leeds.

Adams' Ideal hand-camera, in excellent condition, hardly used; £4; approval.—L. C., 2, College Grounds, Malvern.

Houghton's automatic hand-camera, used once, cost £6 13s. 6d., with case; what cash offer?—No. 165, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Quarter-plate Optimus detective camera, six double backs, focussing screen, fitted with Taylor and Hobson's detective lens, also Optimus rapid view lens; price £8; or will exchange for large camera, 12 by 10.—Fred. Holmes, French Embassy, Albert Gate, S.W.

**Lenses, etc.**—Dallmeyer's R.R. W.A. lens, 1A A new; £4; cost £4 10s.—Harrison, Langley Park, Sutton, Surrey.

5 by 4 Optimus R.R. complete with stops, new; 22s.—H. Beckley, 52, Ilford Road, Ox. ord.

5 by 4 W.A. rectilinear; covers half-plate easily, revolving diaphragms, fitted with instantaneous shutter, working in lens tube, and pneumatic release; bargain, 22s. 6d.; or exchange for good box camera.—Griffin, Chingford, Essex.

Ross's 12 by 10 rapid symmetrical lens, in fine condition; price £7 10s.—C., Hornby Villa, Roj lake, Birkenhead.

Good whole-plate rapid rectilinear lens, make not known, very rapid; price 35s.—Weller, Northumberland Street, Morecambe.

Half-plate R.R. lens, with loose hood, stops f/8 to f/64, as new, splendid definition, approval with pleasure, price 21s.; also Underwood's XL shutter, time and instantaneous, 1½ in. hood, price 5s., cost 10s.—Goddard, 38, Sister's Avenue, Lavender Hill, S.W.

Ross's 6 by 5 rapid symmetrical, as new; 75s.—S., 5, Park Road, Crouch End, N.

Half-plate R.R. lens, cost £2, equal new; price 25s.; exchange good single lens, or offers.—James Gibbons, Haseley, Tetworth, Oxon.

Ross's 10 by 8 rapid symmetrical lens, fitted with Thury and Amey's £6 10s. shutter, best and fastest shutter made; both cost £14 10s.; good as new; will sell, bargain, £9, complete.—Mitchell, Watson and Sons, 313, High Holborn, W.C.

**Roll-Holder.**—Eastman quarter roll-holder, with 10 exposures, recent type; 28s.—Telfer, King Henry's Road, Hampstead.

Eastman's 8½ by 6½ roll-holder, good as new; cost £4 5s.; bargain, £2.—Mitchell, Watson and Sons, 313, High Holborn, W.C.

**Sets.**—Watson's whole-plate Premier set, complete, R.R. and W.A. lenses, dishes, trays, frames, etc., all nearly new and quite perfect; stamp for list.—W. Jones, Enfield House, Uffoulme, Devon.

Lancaster's 1890 Instantograph set, changing bag, dishes, lamp, measures, frames; lot 33s., any time.—Charles Howard, 55, Percival Street, Clerkenwell. Complete full-plate set for sale, all of the finest materials.—Executor, Florence Villa, Portswood, Southampton.

A gentleman giving up photography will dispose of his complete set, comprising Meagber's whole-plate camera, Ross's rapid symmetrical lens, with Newman's shutter and Iris diaphragm, three travelling cases, retouching desk, nine printing frames, complete set of dishes, chemicals, perfect condition; cost over £40; will sell £22; seen by appointment (London).—No. 164, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

For sale, Ross's portrait lens (list price £17 10s.), mahogany camera, whole-plate, one single and three double slides, with carriers for all sizes down to quarter, tripod, and studio stand, background, etc., all in good condition; lowest price £15; on approval. Thomas Usher, Bates Cottages, Holywell via Bockworth, Newcastle.

**Shutters.**—Kershaw shutter, out for lens 1½ in. diameter, in good order; what offers?—Pim, Bonaven, Antrim Road, Belfast.

**Sundries.**—Aquarium, hold 18 gallons, enamelled in black and gold, perfectly watertight, with stand; 57s. 6d., cheap; or part exchange for Lancaster's half-plate Instantograph, of modern pattern, complete.—W. Taylor, 23, Havelock Street, West Hartlepool.

Watkins' exposure meter, new, correct exposures; 8s.—W. R. Moore, Leigh, Lancashire.

## WANTED.

**Cameras, etc.**—Ashford's half-plate camera and 4 double dark-slides.—Geo. Elly, The Stores, Uttoxeter.

Box or studio camera, with two dark-slides, to take whole-plate portrait lens, must be cheap.—Apply Omega, The Cedars, Rickmansworth, Herts.

Camera, whole-plate, three slides, with stand and case, Watson's Acme brass-bound, with turntable, preferred, must have long extension, latest improvements, perfect condition; approval; cash.—Cunningham, 45, Finsart Street, Greenock.

Lancaster's Instantograph quarter-plate camera only, recent pattern.—Rev. Hick, Trimdon Grange, co. Durham.

**Dark Slides.**—Three of Tylar's whole-plate metal dark-slides; state lowest price for cash.—B. Jerome, St. Francis Xavier's, Mayfield, Sussex.

**Hand Cameras, etc.**—Griffiths' or other quarter plate hand-camera, cheap, or good exchange.—Copeman, Henstridge.

Good hand-camera; state make and price.—4, Eaton Street, Hanley.

**Lenses, etc.**—A good rectilinear wide-angle lens, for half-plate camera, must be cheap; would exchange quarter-plate International camera, or sell.—Crooke, Nantwich Road, Crewe.

Quarter-plate wide-angle rectilinear lens, about 3½ in. focus; cheap; approval.—10, Albion Street, Miles Platting, Manchester.

Quarter-plate fixed focus lens lens, for hand-camera.—H. Norris, 15, Seymour Grove, Old Trafford, Manchester.

**Roll-Holder, etc.**—Eastman's quarter roll-holder.—Longden, Wharmfisthe Chambers, Sheffield.

Eastman's quarter-plate roll holder, also good detective lens by Wray, Burr, or other good maker, cheap.—A. Spiller, Hillside, Hampstead Hill Gardens, London, N.W.

**Shutter.**—Thornton-Pickard time and lens instantaneous shutter, 1½ in. hood, preferred with regulating fan, cheap; approval.—Western, Clare, Cambridge.

Thornton-Pickard time and instantaneous shutter, 1½ in. hood; approval.—W. Turner, Merewood, Windermere.

**Views.**—Views, Cornwall; would purchase negatives (north coast) if suitable.—Bullmore, Newquay, Cornwall.

## THE MOST PERFECT HAND CAMERAS

## THE KINEMATIC

PATENT APPLIED FOR.

Has one simple movement only, and not two or three complicated ones; size 9 x 9 x 3½; weight only 4½ lbs., with 12 quarter plates; fitted with rapid achromatic lens and view finder, a shutter ever set for instantaneous or time; and neatly finished in leather.

The "KINEMATIC" is fitted with a patent central opening and closing automatic self-registering exposure shutter which cannot possibly be accidentally opened or shut by vibration or any other cause. This shutter is unique, and is the only one that registers the number of exposures taken, and can be used for either instantaneous or time exposures.

Price £3 3s.

Fuller details, if required, from

**S. T. MATTHEWS & CO.,** 8a, John Bright Street, BIRMINGHAM.

## THE ITAKIT

PATENT APPLIED FOR.

Carries 24 3¼ x 3¼ plates; weighs only 3½ lbs., with plates; fitted with rapid achromatic lens and shutter for instantaneous or time exposure; a marvel of cheapness.

Price 12/6.

Ditto, with view finder and focussing screen, full size of plate, 20/-

Cases for ditto, if desired, 8/6 extra.

Extra magazines for either, 3/6 each. These contain carriers for holding an additional 24 plates.

Specimen Photographs of Itakit, 3 stamps.

## AN EXCELLENT OPPORTUNITY FOR AMATEURS.

## A Wholesale Dealer's STOCK-IN-TRADE AT ABOUT HALF-PRICE.

**J. H. SKINNER & CO.** having purchased of the Trustee to the estate of Mr. J. MOTHERSILL, late of 6, Southampton Row and Holloway Road, the entire Stock-in-Trade at a very large reduction off cost price, now offer it in lots to suit purchasers, at about half the ordinary price. Complete List sent post free on application, including—About 350 dozen Beernaert Dry Plates at 40 to 50 per cent. off List.

About 20,000 C.D.V. and 20,000 Cabinet Mounts. A variety of Cameras at little more than half-price.

4-fold Ash Tripods, with Leather-Covered Brass Top, at 12s. each; ditto, with Bottom Joint Sliding, 14s. each.

Whole Plate Square Camera, with Rising Front, Reversing Back, Rack and Pinion, and 1 Double Slide, at £2 2s.

Also Flash Lamps, Developing Dishes, Instantaneous Shutters, View Finders, Border Negatives, Cloud Negatives, Bromide Paper, Pressure Frames, etc., etc.

All at an ENORMOUS REDUCTION to clear, offered subject to being unsold on receipt of order, as these goods cannot be replaced except at ordinary prices.

COMPLETE LIST SENT POST FREE ON APPLICATION TO—

**J. H. SKINNER & Co.,** Manufacturers of Photographic Apparatus, EAST DEREHAM

SECOND EDITION NOW READY.

AMATEUR PHOTOGRAPHER'S  
= ANNUAL. =

Paper Covers, 1s.; Cloth Boards, 1s. 6d.

"The most useful and handy book of the year, commended by thousands of Photographers; of service alike to beginners and advanced workers."

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, E.C.

## THE "EVEREADY" DARK ROOM.

Strong and thoroughly reliable structures made in sections consisting of four sides, a roof, and a floor, can be screwed together in five minutes, and are then perfectly rigid and substantial. A ventilator is provided in the roof, a sliding window, ruby or yellow, in the front, and a door at the side. Door can be had either left or right side. Inside are shelves for chemicals and appliances, and a Sink 12 by 9 by 2 inches (or special size to order), provided with waste pipe. A bracket is placed outside window for an ordinary lamp to stand on, thus dispensing with the usual ruby lamp altogether, and providing, by means of the sliding window, an easy and effective method of exposing for Bromide or Lantern work. The whole structure is neat and can be stood in corner of any room. Every board is tongued into its fellow, thus preventing ingress of light. Order at once. Remember that more Amateur Photographers fail for want of a proper dark room than from all other causes combined.

Size: 6 ft. 6 in. by 3 ft. 8 in. by 3 ft., or special size to order. Now made in superior style.

PRICE **DAVENPORT & CO.,** PRICE  
35/- 32, Parkhouse St., Camberwell, S.E. 35/-

## CARBUTT'S 'CELLULOID' FILMS

*General Office:*

STUDEBAKER BROS. MANUFACTURING COMPANY,  
South Bend Ind. U.S.A.

MR. JOHN CARBUTT, *Philadelphia.*

DEAR SIR,—I recently returned from a trip to *Australia*, the *East Indies*, *China*, *Japan*, etc., and I feel that I am doing but an act of justice to inform you of the satisfaction I derived from the use of your Films upon this long journey.

When I left home I provided myself with fifty dozen of your 'Eclipse Films,' and every exposure has been a delight to me. I have worked under the most trying circumstances and conditions of light, heat, moisture, etc., when I could hardly expect good results, but your Films never failed to do their duty. In *Samoa* I made snap-shots before sunrise.

The heat in *Australia* last January and February was unusually intense; this, together with warm water, did not hinder the development. I of course had to use great care in my operations, and omitted the glycerine in the treatment of the Films. What I had most to contend with was over-exposure, but I could handle this quite satisfactorily by the use of Hydrochinon Developer.

I could say a great deal for your Films, but I do not wish to tire you. I worked with two officers of our ship who used English plates (\*\*\*\*s), and on the *Borneo Coast* and in *China* all they could get in development was a spot on the cabin floor, while my films came out satisfactory every time. Not once did the CARBUTT FILMS slip off in that intense heat.

As a result of all these, I converted a great many amateurs and professionals, and I hope it may result beneficially to you.

With kind regards, I am, yours truly,

W. B. STOVER.

FOR SALE BY ALL PROMINENT DEALERS.

EVERYTHING seems to point to a very active winter with the lantern. Mr. W. T. Stead, Editor of the *Review of Reviews*, calls our attention to his proposal to form a "National Society of Lanternists," of which the special points are:—

- The combination and concentration of individual effort for promoting the education and recreation of the people by the aid of lantern services, lectures, and entertainments.
- The stimulation and cultivation of slide painting and reproduction as an art.
- The establishment of a system of exchange bureaux for the interchange and hiring of slides, and the diffusion of lantern literature.

Mr. Stead proceeds in his circular to set out the heads of the scheme—Central committee of management; expenses; local branches, either dependent or self-supporting; membership; lanternist or lecturer—and the following special features of the society:—

- That there should be a classified list of all the slide sets issued for sale or hire, with the lowest prices at which they can be procured for mission work.
- That there should be a directory of all competent slide makers, with the terms at which they will work, and particulars of their productions.
- That there should be a directory of all lantern makers and appliances, with the prices at which their productions can be bought or hired.
- That there should be a list of all professional lanternists and lecturers throughout the United Kingdom, with statement of their terms, and particulars as to the nature and subject of their entertainments.
- That there should be published monthly an official organ of the society, which shall contain an account of the progress of the society, together with reports furnished from time to time by the local committees to the central committee of management.

A form of enrolment, to be filled up by those who are in sympathy with the aims and objects of the proposed National Society of Lanternists, may be had upon application to Mr. Stead, Mowbray House, Temple, E.C.

SUCH a society as has been foreshadowed in the foregoing will be found, we fear, a very difficult matter to carry out to a successful issue. The amateur photographer who is also a lanternist finds that he has his time very fully occupied in the winter with "shows" of his own or his friends, and would be able to give little or no help to such a society as Mr. Stead proposes; and we very much expect that Mr. Stead will find that the lantern-slide maker, professional lanternist, and lecturer will demand such terms as to put them outside the work of the society. There are, of course, many scores of the readers of the *AMATEUR PHOTOGRAPHER* who could help Mr. Stead, if, like Mr. Harris, they were so "disposed," but we think he is demanding too much from those who if they help will do so out of charity, and with the real idea of advancing education. We have no doubt an expression of opinion from our subscribers in the correspondence columns would be gratifying to Mr. Stead.

It will be remembered that it was an article which Mr. Stead republished in an early number of the *Review of Reviews* from the *Photographic Quarterly*,\* which set him a-thinking about establishing a Magic Lantern Mission.

\**Photographic Quarterly*, vol. i., April, 1890 (London: Hazell, Watson, and Viney, Ltd., 1s.).

We understand that Mr. Shapoor N. Bhedwar has been honoured with a sitting by H.R.H. the Duke of Edinburgh, at Clarence House. Mr. Bhedwar has been exceedingly successful in all his photographic work, and although we have not seen the portrait of the Duke, we have no doubt Mr. Bhedwar has secured a faithful photograph.

WOULD some of our readers in the western end of London, Hyde Park, Bayswater, Kensington, and Earl's Court grant us permission to introduce amateur photographers in order that they might have the use of their dark-rooms? We particularly often want the use of a photographic dark-room for our lady subscribers, who come to town for the season, and who in the country have the most complete accommodation, and in London sadly feel the want of a place to develop the plates they expose.

THE following note upon the "Amateur Photographer Annual" reaches us from New Brunswick:—"I have just got a copy of your 'Annual' for 1891, and cannot help telling you how very much pleased I am with it. It is certainly unique, and one cannot over-estimate its usefulness. It has already saved me several weary hunts through back numbers." The second edition is being pushed on with, and will be issued shortly.

OUR Edinburgh correspondent writes us that on the motion of Mr. J. M. Turnbull, the question of inviting the members of the Photographic Convention of the United Kingdom to visit Edinburgh in 1892 was discussed at the last meeting of the members of the Edinburgh Photographic Society. The Convention owes much of its success to Scotchmen, and we are certain all workers with the camera would enjoy a week in Edinburgh.

It is probable that a society will be formed at Macclesfield.

WE have received information that a National Photographic Exhibition on a large scale is to take place in Leeds towards the end of the year, promoted by the Fine Art Gallery Committee of the Leeds Corporation, and the Leeds Photographic Society. The probable date of opening will be towards the end of November, and the exhibition will remain open until the middle of January. The official prospectus will shortly appear. In the meantime, any information may be obtained from Mr. Geo. Birkett, Curator, Fine Art Gallery, Leeds.

In our opinion the only matter likely to militate against success is the length of time the exhibition will be open; on the other hand, in such a centre as Leeds, there should be no difficulty in obtaining a thoroughly representative show of photographs.

It will be of interest to our readers to be reminded that on Saturday next, the 6th inst., from 5 to 6.30 p.m., there is to be an annular eclipse of the sun, which will be visible at Greenwich as a partial eclipse. For the benefit of those who are anxious to attempt a photograph of the phenomenon we may point out that the image of the sun is one inch in diameter for every ten feet of focus.

THE June number of *Scribner's Magazine* has some very wonderful reproductions of "Photographs of Luminous Objects," the text being supplied by Mr. Wallace Goold Levison. The author says: "I have believed that some examples, such as are given in the accompanying illustra-

tions from studies in this special direction might interest many in a branch of photography hitherto seldom followed except in scientific research. These are reproductions by mechanical processes directly from the negative without being retouched or changed in any way." The illustrations include a portrait made by lamp-light, exposure four minutes; a firework device, designed to represent the battle between the *Monitor* and *Merrimac*; the Siege of Vera Cruz, as it was presented in fireworks at Manhattam Beach; from a negative exposed during the discharge of two of the cases of a wheel charged with steel filings expressly for the purpose; the interior of a foundry at casting time, in which the figures were taken by flash-light, and the molten metal made its own picture at the same time. Several other pictures are given, and we should strongly advise those interested in photography to read the article.

In concluding, Mr. Levison says: "Indeed, every advance in the art of photography develops important applications of it in entirely new and unexpected directions. Not only a small body of professional photographers are intensely interested in important experiments, but a body of amateurs so large as to include almost every section of a community is busily at work with new devices and new methods, supplementing private letters, diaries, newspaper correspondence, and literary work with accurate and picturesque records of every degree of importance. The result will be that this age, as no previous one, will leave a complete pictorial representation of all phases of its varied life."

THE Directors of the Eastman Photographic Materials Company, Limited, called an extraordinary meeting of the shareholders on the 26th ult. to empower them to increase the capital of the Company from £150,000 to £200,000. The Chairman (Colonel J. T. Griffin) said (*vide* report in *Financial News*) that:

"The business of the Company had altogether outgrown present means of carrying it on. Its growth, in fact, had been in many respects far beyond the expectations of most sanguine friends. At the last annual meeting the question was asked when the balance of the unpaid capital would be called up. The answer was, 'Not until it is required.' At that moment the Company had sufficient funds for carrying on its work; but since then the volume of business had so enormously increased that the Directors found the capital largely locked up in outstanding accounts. More than that, the building at Harrow was now completed, and within a few weeks would be in a position to manufacture the larger part of the Company's goods. Under those circumstances, the capital was found to be not quite sufficient for trading purposes, and, therefore, the Directors came to the conclusion to ask the shareholders' authority for increasing the capital from £150,000 to £200,000. They wanted, at present, only £10,000 or £15,000; and as showing their confidence in the business being transacted in Europe, the parent Company had offered to take up £10,000. The Company at the present moment owed the parent Company about £8,000 for goods received, and upon that sum they were obliged to pay interest. The Directors wished to relieve themselves of that obligation, and to become their own masters. He might add that the volume of business had increased 50 per cent. during the past three months, whilst orders were still coming in to such an extent that they could not be duly executed. It was also in contemplation to establish branches of the Company at Paris, Berlin, and other places on the Continent, all of which work would require additional capital, inasmuch as it was necessary to keep large stocks at the various depots."

The resolution was put to the meeting and duly carried, "That such new shares shall be issued at such times and in such manner upon such terms and conditions as the Directors shall from time to time determine."

THE *Photographic Quarterly* for July, which will complete vol. ii., will, as far as at present arranged, contain

articles by: Mr. John Andrews, "Composition"; Mr. Philip H. Newman, "What to Photograph"; Mr. G. H. James, "Autotype Printing in Pigments"; Mr. E. H. Jeffrey, "In Holland with a Camera"; Rev. T. Perkins, "A Ramble in Spireland" (illustrated); Mr. C. H. Bothamley, "The Lantern and the Manipulation of It" (illustrated); Mr. Clement J. Leaper, "Toning of Images"; "A Sketch" by Luke Sharp of the *Detroit Free Press*; and an article by Mr. George Davison, Hon. Secretary of the Camera Club, entitled "Shall we Renounce?"

The frontispiece will be a production of a flashlight photograph, "The Future Schoolmaster," one of the series for which the Countess Loredana da Porto Bono was awarded a gold medal at the recent Liverpool Photographic Exhibition. It is also hoped that the illustrations will include a copy of "The Beggar Maid," by Mrs. Eveleen Myers.

From the foregoing it will be seen that the last number of the second volume of the *Photographic Quarterly* will thoroughly maintain the high standard of previous issues of the magazine.

### HOME PORTRAITURE.

To the more ambitious spirit home portraiture opens up an enormously wide field for practical experiments, which, if successful, lead to fine pictorial results. We shall therefore give a few hints which may suggest some subjects to the more advanced worker who is not afraid of combination printing, and the little trouble it entails.

We will take first of all a comparatively easy subject. This is a sitter seated by a window writing or reading; through the window is seen a fine landscape. Now, if we give sufficiently long exposure for the figure to obtain detail in the deeper shadows, we shall enormously over-expose for the landscape, so much so as to make it extremely difficult to develop the plate so as to obtain detail in the landscape. The best plan to obtain such an effect is to make two exposures; thus we may suggest 15 to 20 seconds exposure for the figure, the lighting of which will be the so-called Rembrandt style, whereas probably 1 to 2 seconds would be sufficient for the landscape. We should give the longer exposure to the figure first, and then, without changing the position of camera, or allowing the sitter to move, we should insert another dark-slide, and give a short exposure for the landscape. On development we shall obtain two negatives, one well exposed for the portrait and over-exposed for the landscape, the other correctly exposed for the landscape and a mere ghost of a figure. By double or combination printing, we can obtain a very good picture. Another subject which would give the best results by flashlight would be a group round a fire, which may be treated in the same way, and if a good negative of the fire itself is required, it is advisable to throw salt or powdered sulphur on to it to make a rather more actinic blaze.

Another class of subject which is by no means difficult, though one which perhaps ought not to be included in picture making, is the production of ghost pictures, which are by no means difficult to make. The usual method of making the ghost wear white cerecloths is entirely unnecessary. Thus a subject for a picture might very well be made by those possessed of the requisite accessories—an old hall, some antique clothes, etc. We will call our picture "The Ancestral Ghost;" the scene, a long passage or corridor dimly lighted, preferably by a grated window high up; a friend, either lady or gentleman, dressed in habiliments of the last century. Now, if we have such a corridor we can easily make the picture. A magic lantern placed outside the window, which may be real or temporary, may be used to project a beam of light on to the floor, in the path of which

the lady or gentleman should stand for about one or two seconds; the cap should be placed on the lens, and then the subject allowed to walk away, and a fairly long exposure given to the corridor. If this plate be successfully exposed and developed we shall have a somewhat thin negative of the corridor or room, with a ghostlike figure in the beam of light, and by printing deeply on ordinary albumenised paper, tinted blue or green, we shall have a very fair picture of a moonlight visitor in the shape of "the ancestral ghost."

Another subject, or, in fact, a host of subjects, may be taken from some well-known poem. Thus we held a competition in Shakespeare's well-known lines, "The Seven Ages of Man." This is, however, a difficult subject, because of the necessary sequence of seven pictures; but let us take one or two lines, and see how well they suggest a picture. Thus Sir Edwin Arnold's charming lays of "The Twelve Months" would furnish us with a picture for every lay; thus for December—

"In fretwork of frost and spangle of snow."

Tennyson, too, gives us many a suggestion; his charming songs in "The Princess," and "In Memoriam" teem with subjects by no means difficult to illustrate. William Cullen Bryant is also another writer whose breezy poems certainly lend themselves most charmingly for titling woodland scenes. The Photographers' Association of America have this year set as a subject "Elaine," which is full of suggestions; and the only way to get hold of inspiration for picture making from such material is to read the poem, digest it, and find out in leisure moments all the hidden beauties in it, and then artistic results may be obtained. To this work, however, we need hardly devote any more space. Any operator with artistic and refined taste will find his own pictures without any help from us, and successful execution is merely a matter of practice and experience.

## Letters to the Editor.

### HOLIDAY RESORTS.

SIR,—If I might supplement the paper upon Cambridge which appears in to-day's issue of the AMATEUR PHOTOGRAPHER, I would like to say a few words about permission. Of course, no permission is required for taking street views, but inside the colleges it is different; a porter will soon ask you if you have permission.

The best way is to interview a porter before commencing operations; he would tell you whom to apply to, or he might be able to give it himself. At Trinity, amateurs have now to sign in a book kept for the purpose at the porter's lodge; that constitutes permission. I think it is not very difficult to obtain permission at most of the colleges, but I thought it might save some slight inconvenience by sending you these few remarks. I might perhaps also say "the Backs" should certainly not be missed, as several good views can be got, and the little river Cam is interesting from Byron's Pool at Grantchester (two miles south of Cambridge) to three or four miles lower down.—Yours, etc,  
Cambridge, May 29th, 1891. W. H. HAYLES.

\* \* \* \*

### HELP FOR THE RAGGED SCHOOL UNION.

SIR,—I am emboldened to ask your leave for a brief space in which to plead the cause of the holiday homes movement of this union, for the reason that among the 4,000 voluntary helpers we have many to whose skill, as amateur and professional photographers, we are indebted for many effective pictures of the 50,000 attendants at our 200 schools and missions.

The object of the holiday home movement is a fortnight's holiday in the country, for the children of our schools.

Our needs are the pounds, shillings, and pence of your

readers; gifts of boots, clothing, and provisions; drawing-room meetings; garden parties; ladies' working parties; church, chapel, school, family, hotel, office, warehouse, and workshop collections. Will your readers—as all can—in some way respond to our appeal?

Our holiday homes are in the midst of picturesque scenery; from any of your readers who may require practice in figure, group, or landscape work I shall be glad to hear.—Yours obediently,  
Ragged School Union, Exeter Hall,  
Strand, London, W.C.

#### AMATEURS' ALBUMS.

SIR,—An article appears in a recent issue, "Amateur Albums," by "Nestor." Now it seems to me that "Nestor's" opinion of an amateur photographer is, to say the least of it, most extraordinary. He makes him out to be a person with a very small amount of sense indeed. I do not think for a moment that every amateur's attempts at portraiture are, as "Nestor's" states, "horrible," nor do I think every amateur is so devoid of sense as to leave his walking-stick so that it will come into his pictures. Does every amateur put every photograph he takes into his album? I think not; most amateurs like to keep only what pleases them, very few care about pictures which are not only eyesores to themselves, but which are apt to make them appear foolish in the eyes of their friends. I know many beginners in photography, and I have seen all or nearly all their work, but I think that pictures which are "horrible" to the eyes of people possessing "Nestor's" delicate observation are either destroyed before they are finished or else put where no one will see them but the operator.—Yours, etc.,

COMMON SENSE.

\* \* \* \*

#### AMATEUR AND PROFESSIONAL.

SIR,—The vexed question of Amateur v. Professional seems to come periodically to the fore, as surely as the sea-serpent and the "silly season," or even as the influenza epidemic bids fair to do. It does not seem to me a question of the mere selling of one's work. I am an amateur of the very lowest grade, and all that I have learned of the art of photography has been from books and the pages of the AMATEUR PHOTOGRAPHER. I never saw a professional or even one of our kings among amateurs at work, and never had a lesson. Well, one day, a few weeks after I had purchased my camera, I took some photographs of groups at a school feast by way of amusing the scholars. By good luck they proved successful, and dozens of the sitters wanted copies. "Very well," said I, "every one who wants a copy must pay 6d. to the sick fund of the school." Did this sale convert me into a professional? Subsequently the members of a mothers' meeting implored me to take them, and instead of presenting each mother with a copy, I handed them all over to our vicar for his missionary sale, where they were bought. Then the haymakers were so delighted with their appearance that they pleaded for copies of themselves, which they received on paying so much to a local charity. An old lady then "sat" to me, and was presented with a dozen copies of herself. I heard privately she wanted another dozen but did not like to ask for them, so I promptly sent word that she should have them on handing over a certain sum to me for a poor orphan in whom I was interested. And lastly, the editor of one of our gardening papers has more than once asked for a photograph of some special plant for publication, and sent me the remuneration ordinarily offered for the same, which I have at once devoted to some charitable object. Now it seems to me that none of these sales of my works can drive me from the ranks of amateurs, any more than Lady Dalton Fitzgerald became a professional when permitted by the Queen to sell her views of Buckingham Palace for the benefit of the Belgrave Hospital for Children. I suppose one must draw a line somewhere, or I myself would even go further, and say that a photographer might still be an amateur even if he occasionally (such as a boy at school) added a few pence to his allowance by the sale of his photographs. A water-colour sketch sold to a friend does not make the artist a professional, any more than a paid article in one of our papers would convert the writer into an author as that word is commonly understood. I think that it should be binding on any amateur competing in an exhibition, that the work be entirely his own, from the very beginning to the very end.—Yours, etc.,

LOLA.

## Influence of Development on Gradation.

At the meeting of the Photographic Society of Great Britain on the 26th ult., the Chairman (Captain Abney) said the subject for discussion was the "Influence of Development on Gradation," and called upon Mr. G. L. Addenbrooke to open the discussion.

Mr. G. L. Addenbrooke said that on January 22nd, 1883, a discussion on this subject took place, and what he had to say was merely a repetition of what he said then. At that time he made a number of experiments with a sensitometer given him by Mr. Warnerke. The sensitometer was placed at the distance of a foot from a candle, and plates specially made for him were employed. Trial exposures were made until he found that with a normal developer he could just see the smallest trace of No. 25. The object of the experiments was to ascertain how far the lower numbers were blocked up. The first series of negatives were made by using a normal developer composed of 2 minims of ammonia and one-eighth of a grain of bromide to the ounce, the pyrogallol varying from an eighth of a grain to 2 grains to the ounce, distilled water being used. All the plates were developed at the same temperature, and were kept in the developer for the same length of time. As a result there was a gradual improvement in the density, but towards the end of the series, increasing the amount of pyrogallol had but little effect. He also tried a time action, the duration of development varying with the quantity of bromide. He also made a series with a developer containing 2 grains of pyrogallol to the ounce, and varying the ammonia from half a minim to about 4 or 5 minims, and found that when the proportion of 2 of ammonia to 1 of pyrogallol was exceeded, but little alteration was produced. Indeed, beyond these limits either no change was effected or a deleterious effect was produced. Mr. Mackie had been experimenting in this direction lately. At the time he made his communication there was no discussion, and as his experiments were not received with any favour, he had not thought it worth while to continue them.

Mr. W. Atkinson asked whether with a slow developer better results were obtained.

Mr. Addenbrooke thought slow development favoured some variation, but it did not produce any very noteworthy effect.

Mr. A. Mackie had made a series of experiments in view of this discussion, and they were practically upon the lines followed by Mr. Addenbrooke, only the latter used plain pyrogallol and distilled water.

He took as a normal developer 2 grains of pyrogallol, 1 grain of bromide, and 2 minims of ammonia to the ounce. He developed until the 25 on the sensitometer was visible by both transmitted and reflected light. In the first series the amount of pyrogallol was varied from  $\frac{1}{2}$  to 4 grains to the ounce. It appears that up to a certain amount the pyrogallol increased the density of the negative, but a larger quantity did not increase the effect. A second series was made, the developers consisting of  $1\frac{1}{2}$  grains of pyrogallol and 2 minims of ammonia, the bromide varying from 0 to 4 grains to the ounce. From these plates it seemed that within certain limits the increase of pyrogallol and the increase of bromide acted practically in the same way.

The third series was made by varying the amount of ammonia. These alterations seemed to have but little influence. The developers used were composed of  $1\frac{1}{2}$  grains of pyrogallol and 1 grain of bromide to the ounce, the ammonia varying from 1 to 8 minims. Increasing the ammonia practically had the same effect as decreasing the bromide or pyrogallol, but the results were not so striking with ammonia.

Mr. Chapman Jones said he commended Mr. Mackie for having developed all his plates till a certain tint showed. Of course it was interesting to know the effect of time, but practically the time of development was not an important question unless it was necessary to do a lot of work. The statements that Messrs. Hurter and Driffeld made in their paper were with almost no qualifications. They said that the ratio of the densities were unalterable. They had made variations in the time of development, and variations in the form of developer, but practically the ratios of the densities were unchanged. That statement was made without any limitation whatever, and it was to that that he took exception—he thought those statements required qualifying. The negative plate has an appreciable thickness, every operation

commences on one side of the film, and works downwards through it. If development began on one side, then the shadows ought to be obtained before the lights, but these experiments show that the circumstances of the case are different, that although the details of the shadows lie on the surface, yet they are the last to appear. It was difficult to imagine throughout every modification this uniform ratio of density could be obtained, but he believed that within certain limits it could be obtained provided under and over exposure were excluded from consideration.

Dr. F. Hurter said he and his colleague were under the belief that photographers assumed that they could, by judicious development, remedy the effect of over-exposure. Recently, however, a London professor called upon them and told them they were entirely mistaken, for he did not think there was a photographer in existence who believed he could correct the effect of over-exposure. What he taught was that ammonia acted upon a plate in the same way as light did, and that a judicious use of ammonia might remedy the error. But whenever he (the speaker) unpacked any plates, he found enclosed a prescription for the development of the plates, and was told what to do should the picture be over-exposed. He thought he was correct in saying that a great many photographers believed that the evil effects caused by over-exposure could be remedied by the use of more bromide, and in case of under exposure by the use of more ammonia. That was where the general methods of photographers were at fault. He believed he had made an alteration. Again, in judging these results of experiments made in the camera, photographers relied entirely upon their eyes unaided by any instrument. The eye, however, was perfectly powerless to estimate the value of two tones, for when they are unequal it was impossible to say what was the amount of the inequality between them. He and his colleague had endeavoured to supply the necessary experiments. He was satisfied that in the original paper there were errors in both directions. That paper had been misunderstood, partly owing to their own fault, as they used the word "density" in a peculiar sense differing from the meaning applied to the term by photographers. Captain Abney expressed the results of his measurements in transparencies, they could have done the same, but then it would have been a difficult matter for them to have discovered their result. Their experiments were made for the special purpose of ascertaining how far development might be varied without altering the speed of the plate. When the ordinates are taken in arithmetical progression, the curve obtained did not supply much information about the character of the plate, but when the densities were laid down on ordinates arranged in a geometrical progression, the curve assumed a different form, and there was one point on the curve which always remained on the same ordinate, however much the development might be varied. This point is the point of flexion of a double curve, and if a tangent be drawn to this point so as to intersect the line of exposure, it would be found that these tangents drawn from curves obtained by varied development would all intersect the exposure line at the same point. This point must be considered as characteristic of the plate under examination and as measuring its speed. They had found that by giving an extraordinary dose of ammonia, the curve was raised higher and the point of intersection shifted further out, the tangent remaining parallel to its former position. That was the greatest variation they had yet found in the influence of development, but the peculiar part of this change was that it did not affect the printing quality of the negative at all. Indeed, the effect of shifting up the curve was the same as placing a semi-transparent medium in front of the negative when printing. It was possible to make the negatives appear more or less brilliant to the eye, but the density ratios remained practically the same.

Mr. G. L. Addenbrooke, referring to the case of photographing a lady in a white dress against a dark background, said that in order to avoid losing the details of the dress, and at the same time to secure the details in the dark portion of the picture, he should reduce the amount of bromide and pyrogallol, and should so obtain a very equal development, the action on the shadows taking place rapidly in proportion to that on the lights. In the case of a landscape with dark foliage he would give a very full exposure and use a fair proportion of bromide, a full quantity of pyrogallol, but would keep the ammonia down very much. In that way it was possible to secure all the brilliancy that is obtainable in the lower tones without too great density, and it was with the object of ascertaining what might be done in varying negatives that he experimented. The variations were very small.

Mr. W. E. Debenham considered the want of range of gradation in photography was its greatest defect; that he thought would be admitted. If the range of gradation could be increased by development it would be most important, but Dr. Hurter said it could not be. The want of perfect gradation in photography was a problem that must be attacked with all possible vigour, and if there was no hope of attaining this end by development, it might be done in other ways.

Mr. H. G. Moberly thought there was a little misunderstanding as to what Dr. Hurter really did mean. He did not deny that in one negative it was possible to obtain a greater amount of density than in another.

Dr. Hurter said the difficulty was still the distinction between opacity and density. Photographers judged simply by the amount of light transmitted, while they weighed the quantity of silver. From the photographer's point of view, it appeared that the gradation to the eye was altered, but from the ratios it was evident that no alteration was effected.

Mr. E. Clifton said that Dr. Hurter used the term density in a chemical sense, while photographers used it in an optical sense.

Mr. J. Howson said that although it appeared that photographers could not alter the density ratios they could the printing qualities. This was all they cared for.

Dr. F. Hurter said that did not enable them to make an over or under exposure into a correct one.

Mr. W. H. Bennett said by difference of development of two plates similarly exposed upon a mantelpiece of dark oak and white marble, he had been able to bring out details in the one not shown in the other. The difference in development was that in one case the ordinary method had been adopted, and in the one where the detail was obtained there was first a faint image produced by using very little pyrogallol and bromide, and a full dose of ammonia, the image being subsequently strengthened by further development.

The Chairman said there had been some mistakes in the way in which the terms density and opacity had been used. Dr. Hurter had used it in the chemical sense, while they used it in the optical sense. He did not think casual eye determinations of much value, and there had been a slight difference between Dr. Hurter and himself as to the mode of measuring, but he thought they were coming by degrees to a mutual understanding as to how they should agree as to measurements; and he therefore did not wish to say anything till Dr. Hurter had had an opportunity to make certain experiments. When they got scientific men working in the science of photography they were certainly taking a step in advance. He admired immensely the work Dr. Hurter and Mr. Driffield had done, and they had heard how Dr. Hurter had left Liverpool at very short notice to come up to that meeting. He begged to thank Dr. Hurter for the trouble he had taken in coming there that evening. No doubt the discussion would be continued on a subsequent occasion, and doubtless Dr. Hurter would read in the Journal what had taken place and would favour the Society with his comments.

Dr. Hurter was very much obliged for the kind words spoken by Captain Abney, and was exceedingly sorry that it had been his fate to come into collision with him. He could only say that having paid a visit to Captain Abney's laboratory, and having made experiments with his sector himself, he had come to the conclusion it was simply perfection. The differences between Captain Abney and themselves had now been so far cleared away that they each trusted the other's instrument. There was a difference between the results of the two instruments, and he thought it was this difference to which Captain Abney has just alluded.

**The "Sensible" Focussing Cloth.**—Mr. T. Manson writes:—"In your issue of April 17th you kindly gave my focussing cloth a very favourable notice, and through that and my advertisements in your paper I have received a large number of orders. In one point, however, it has caused some misapprehension, and I should be glad if you would kindly set it right. It reads, in part underlined, 'Is large enough to admit the head and one arm to rack out camera.' This is so with the larger sizes, but with quarter-plate size it is impossible, and a very cramped operation in half-plate size. The idea was that the focussing screw should be turned from outside the cloth, which is quite easy. I have used one two seasons, and always turned all the screws from outside, and so have others about here to whom I have supplied them. As it has caused me some little trouble, a line setting it right would be much appreciated."

## Photo-Micrography.—X.

BY ANDREW PRINGLE.

### OPAQUE OBJECTS—BLACK GROUNDS—POLARISED LIGHT.

For various reasons the photographing with microscopic objectives of opaque objects is surrounded with considerable difficulties, and these difficulties are very great indeed when the work requires to be done at anything like high magnification. It is not hard to understand that when we have to use a lens of even medium power the lens has to be placed so near to the object that it is extremely difficult to get a beam of light directed so as to illuminate the object, for the light must, of course, come from the front of the object so that the lens and the sensitive plate may be illuminated by light reflected from the object; and at high power work the front combination of the objective is almost touching the "cover-glass" of the preparation, while, if we are using an immersion lens the attempt is out of the question altogether. At the same time, much useful work may be done on opaque objects if low magnification only is required. To be more definite, I have done some useful work, and I have seen still more valuable work done with objectives as high in power as half-inch focal length.

It will be found that for this class of work there is an advantage in having objectives which are more or less tapering towards their front combination, because this shape allows the light from the front to fall on the object at a more acute angle, which is, of course, an advantage, especially when no reflector is to be used. If I am working without any reflector I place the radiant as near the tube of the microscope as my objective will allow, that is to say, I make the angle of illumination as acute as possible, and some condensing appliance is placed between the light and the object. The condenser, which may be a bull's eye, is so arranged that the whole of the object desired in the photograph is evenly illuminated, and this position must be found by experiment. But it will be found a great improvement and a great facilitation to use a reflector of the kind figured (fig. 5), and usually called a "parabolic reflector."

This instrument consists of a metallic speculum somewhat in the shape of a half cup, and it is well to be careful not to damage the bright surface by fingering it. This may be used with daylight, but the better way is to place a lamp such as is used for the ordinary photo-micrographic work on the side of the stage directly opposite to the reflector, and to parallelise the rays falling on the reflector by means of a bull's-eye or other parallelising appliance. It is to be noticed that we do not use this reflector to reflect back rays which have already been reflected from the object, though it is sometimes wrongly used in this way; but the reflector is to illuminate the object by reflection of the light.

FIG. 5.

The proper position for the reflector must be found by obser-

vation; it is not difficult to tell when the object is well and evenly illuminated if we examine it through the microscope in the usual way. This useful instrument is made by all opticians; the one here figured is by Messrs. Swift and Son.

Sometimes objects are mounted specially for observation with the "Lieberkuhn." This is a very pretty instrument seldom used nowadays. Fig. 6 shows its appearance. The object is mounted on an opaque ground surrounded by clear glass; parallel rays are projected from the sub stage through the clear area, and from the metal speculum are reflected back upon the object. With this instrument it is of importance that the object shall be in the focus of the hollow mirror—or, rather, speculum—and it follows that each objective requires a Lieberkuhn of a suitable focal length. As this instrument is now but rarely used, and as objects are not often mounted for it, I shall not enlarge on this subject further than to say that by means of it the best photographs of opaque objects I have seen were obtained.

FIG. 6.

A very important branch of our work sometimes is that of showing transparent objects on a black background; diatoms, at low and medium powers, are perhaps best shown in this way. Various contrivances have been used for this purpose—"spot-lenses," "paraboloids," and so on; but the best method and the commonest now is the use of opaque discs placed in the condenser. These are, I believe, sold with every condenser, though I do not know their technical name. Their effect is to shut out the central rays, so that practically the object becomes its own illuminant. For practice with in this work there are no better subjects than fairly large diatoms. It will be well for me to describe step by step the procedure to be followed in this kind of operation. In the first place there is in practice a limit of magnification to be obtained with this device, or more accurately, there is a limit of angle for which it is available; and it will be well for the beginner not to use an objective of higher power than one inch. If medium powers are to be used, as say a quarter inch, then we require to cut down the angle of the objective by inserting in the back of it a disc with an aperture smaller than the back combination usually found in a quarter-inch glass. In fact, it is better to put such a stop into the back of any lens used for this purpose; if the lens has a focal length of one inch or less, and if it is of the usual construction. The condenser should be of considerable angle; I use with a one-inch glass a condenser of N. A. 1. A bull's-eye may or may not be used in addition to the condenser according to circumstances.

To start with, the object must be carefully centred, and the condenser centred and focussed without the black ground stop, and then the latter stop is to be inserted into the condenser which is fitted to receive it. The point is to get the object as brightly lighted, and the ground as black as possible, care being taken that the edges of the object are not blurred, which is a very common fault. It will probably be found necessary to alter the focus of the condenser in order to obtain this state of matters. The line to follow is to find and use the *smallest stop which will give the effect* I have described, viz., a brilliant object on a black ground. Of course, the exposure for this work is very much longer than when we are using direct lighting in the ordinary way.

There are occasions when it is useful to use a central stop or disc even when we do not require nor desire a black ground. I allude to certain occasions when we have to photograph extremely pellucid or highly refractive objects.

I have not yet fully worked out this method so as to be able to give definite suggestions for its use; but I have several times got, by putting into the condenser one of these stops so as to shut out the central rays, better renderings than I was able to obtain with the usual arrangement of the condenser.

There is a large field open to the photo-micrographer in the way of working with polarised light. For such work as the rendering of starches and other "polarisable" matter this line is of great value. I have not done much in this way myself, but so far as I went I found that beyond the skill and knowledge required for the examination of objects by polarised light the chief *crux* was that of exposure. As everyone knows who has worked with a polariser, the colours at certain positions of the prisms are very puzzling to photograph, if not impossible; but if suitable positions are available and are used, the exposures need not be so very long. The most important point for those who propose to devote themselves to any considerable extent to this branch of photo-micrography is to obtain prisms as large as possible.

In these chapters I have not pretended to treat the subject of photo-micrography in a "deeply scientific" way, but have tried rather to express myself clearly on elementary operations. If I have lightened the labour of any one beginning this useful and fascinating science, my object is attained.

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER XI.

*Fig. 23.* In this subject Rubens displays all the easy fluency of a great master, who would consider such a design only as an amusement. The manner in which the figures are interwoven with each other, the mode resorted to, to assist the projecting and retiring points, and the velocity with which the whole appears to move, are all worthy of the artist's attention.

In "The Death of General Wolfe," *Fig. 24*, West has adopted the form of composition described in the last chapter

FIG. 23.—RUBENS.

to produce his mass of shadow in the middle of the group, and to bring it in contact with the light on the principal figure.

It is not only necessary that a group should have hollows for the reception of shadow, but also projections for the light to rest upon; it not only ought to possess a good general form in the outline which defines it, but the figures

must also be linked together in such a way as to lead the spectator in amongst them. They must appear to have room to stand upon, and every figure must keep his place in its relative distance from the eye; hence a form composed of a concave and convex line has been often adopted as the simplest and best, and possessing the greatest variety of advantages. That it is so generally used will cease to

FIG. 24.—B. WEST.

surprise us, when we find it applicable both to the regularity of Raphael and the irregularity of Rembrandt.

*Fig. 25.* "Cattle returning home in a shower." In this composition the principal light falls on the convex part of the group, and the depth of the shadow is assisted by the local colour of the objects placed in it. The goat in the foreground is connected to the rest by some white flowers of an elder bush, which cannot be expressed in an outline.

*Fig. 26* is a repetition of the same form.

Although we now think little of Benjamin West as an artist, his "Death of General Wolfe" was a famous picture in its time, and in one respect an "epoch maker," as I will presently show. Burnet has been content to say so little about the composition that it leaves me more space than usual in these notes, and a text of which I am glad to avail myself.

First of the composition. In an early volume of the *Photographic News*, Mr. Lake Price made a careful analysis of the picture which I cannot do better than quote:

"We observe the stricken hero prostrate in the centre of the picture, the sympathy of his officers and soldiers in the fall of their general being well expressed.

"The 'red-man,' hard of nerve himself, looks on with interest to see the resignation of the white chief to his fate; whilst the cry from the battle-field, 'They run! they run!' is perfectly shown by the panting figures on the right, and the more episodal one in the distance. The arms of the pointing figures cross each other, thus composing. The animated figure of the trapper or huntsman is most necessary, and gives the fact and sentiment to the still repose of the group immediately round the dying man. The grenadier, standing rather apart, judiciously separates the grouping, and prevents it being monotonous and crowded. The colours and their straight staff carry up and break the top line of the composition, and give value to the action.

"The advancing figure is prevented over-balancing by the crouching Indian beneath, which makes a mass with him. The balancing line of the Indian's gun cannot be dispensed with, though the artist has judiciously broken it by the intervening knee; nor the cap of the grenadier on the ground, which composes with the lines of his figure, and completes the group; whilst the dark hat under Wolfe finishes the circle, and gives distance to the lighter parts behind. The gun on the ground completes the base-line carried through the foreground. This is a most perfect composition, and should be well studied. We have first the story, told in a touching and distinct manner; next we have the main lines, traversing the subject horizontally, balancing with

each other; at the same time each figure either composes with its own base, or forms part of another mass, the whole arrangement, in its linear composition, being admirably susceptible of subsequent chiaroscuro."

Next as an epoch maker. It was with this picture that common sense in historical painting in England commenced. The picture was first exhibited in 1771. Before this period the most ridiculous absurdities were perpetrated in the costumes, not only in historical pictures, but in every other class of painting. The picturesque dress of the day was thought too barbarous for the sham classical taste of the time of James the First. This taste, revived by Verrio and Laguerre, was in the height of fashion when West commenced his "Death of General Wolfe." A portrait painter seldom allowed a sitter to appear in his own dress; if his subject were a lady, she was transformed into a shepherdess with a spud in her hand, tending sheep in Arcadia; if a youth, the distinction of sex was indicated by giving him a crook instead of a spud, and Pandean pipes. Men were dressed in armour of an earlier period, and it appeared to be a law as binding as those of the Medes and Persians, that in historical subjects the figures should be dressed in Greek or Roman costume, or not so much costume of the actual Greeks and Romans as a dress in which they were supposed to appear. If a battle-piece were represented, the king or general, "the noblest Roman of them all," was set in the front, bearing no possible proportion to the rest of the combatants. Thus, if the dubious costumes were to be believed, actions of Englishmen in the seventeenth and eighteenth centuries were performed by the people of extinct nations. But to make the thing still more absurd, although the dress was exchanged for Roman armour, the

of those who fell at Waterloo, and find that some of them, with that enthusiasm which disregards appearances or causes for uniform, actually went into battle without any clothes at all!

West, much against the advice of his friends, dismissed this pedantry, and restored nature and propriety to his noble work. Allan Cunningham, in his life of West, speaking of

FIG. 25.—JAMES BURNET.

this picture, says:—"The multitude acknowledged its excellence at once; the lovers of old art, the manufacturers of pictures called by courtesy classical, complained of the barbarism of boots, and buttons, and blunderbusses, and cried out for naked warriors, with bows, bucklers, and battering rams." A sensible man like Sir Joshua Reynolds was so blinded by the fashion of the time, that he entreated the artist to recollect the danger of an innovation which would incur contempt and ridicule, and urged him to adopt the costume of antiquity as more becoming the greatness of the subject than the garb of modern warriors.

Reynolds afterwards acknowledged, when he saw the completed picture, that the artist was right and said to a friend, "I foresee that this picture will not only become one of the most popular, but will occasion a revolution in art." At that time, truth of effect in art was so little regarded, that Garrick thought it right to play Macbeth in a full Court suit, and murdered Duncan, in a bagwig, with a dress-sword!

Figs. 25 and 26 are good forms of landscape composition which may be easily carried out by the photographer.

—•••••—

**Correction.**—Mr. Henry M. C. Sprunt writes:—"I wish to call your attention to an error in the article on 'Instantaneous Photography.' In the description of a single lens the block of a wide-angle rectilinear has been used in mistake, and would be very misleading."

FIG. 26.—JAMES BURNET.

enormous wigs of the period were retained! Fine examples of this false classicality are to be found in London, especially in Westminster Abbey and St. Paul's Cathedral, where, by-the-way, there is evidence of a further decadence in artistic truth. The classic heroes of the early Georges were at least dressed, if dressed absurdly; but passing by Dr. Johnson and others who are wrapped in blankets, we come to the monuments erected to the memory

## Collotype Made Easy.

By A. VON SAVROFF (ST. PETERSBURG).

MANY professional and amateur photographers have desired to know a process by means of which they could cheaply and quickly reproduce their work; this I gather from the numerous questions addressed to me, and which caused me to undertake the work which has been interesting me for some time. I experimented with the chromium salts, and studied the phototype process, in order to see whether this could not be called into the assistance of the amateur photographer. After I had read the best books which have been written on the subject, I naturally tried to practically apply that which I had theoretically learnt; that is say, I tried to produce a gelatine cliché or matrix. Every trial failed, and I saw that in all the books which treated on this subject, much was not clearly stated or even entirely kept secret. I concluded, therefore, to make my own particular process, and now at last I have obtained good results. The actual procedure of the phototype process remains in the greater details, the same as it is shown in the books which treat of this question. I direct attention therefore to the little points which appear at first sight so trivial, but are of the greatest importance for the success of the thing.

Instead of plate glasses, which were recommended by many, I used ordinary thick mirror glass, with a slight matt surface on one side. Before coating the glass with the first substratum, it was rubbed for five minutes with a thick pad and finely sifted emery mixed with water, after which it was washed clean with running water and placed on a stand to dry. In order to remove any possible grease that might have adhered to the fingers or be caused by the traces of soap in the linen, the glass is washed in a solution of ammonia and water, wiped with tissue paper, and again placed up to dry, after which it is then coated with the following solution, which forms the substratum:—

Beer .. .. .	100 parts.
Water glass .. .. .	10 "

It is advisable, in order to obtain the beer free from gases, to pour it out into an open vessel several hours before use, and to allow it to stand. The water glass is then mixed with the beer in the above-mentioned proportion, and the mixture filtered through flannel, and used immediately; otherwise it spoils and becomes useless for the substratum. The glass is coated with it in an horizontal position, and is then placed vertically upon a stand or merely propped up against the wall. In about half an hour the glass is sufficiently dry to be coated with the second substratum. My experience has proved to me, however, that it is advisable to allow it to stand for several hours. I have obtained the best results after allowing it to stand for twenty-four hours.

Before coating with the second substratum, the glass is again washed with a solution of ammonia and water; and the surfaces of the glass may be lightly brushed with a soft brush, so that any possible dust may be removed. The glass is then placed in a drying box, the cover of which remains open. The following is the construction of the drying box:—It consists of a simple wooden box on legs. The bottom is made of thin zinc, which is fastened with nails. The cover consists of a wood frame, the middle of which is covered underneath with black calico, and above this with thin black cloth. A small round hole is made in the box for the thermometer. Wooden pegs in the box serve to hold the glasses. The dry current of air can be produced by a benzine lamp. The sensitive coating of chromated gelatine is prepared beforehand before the substratum. The ordinary procedure is as follows:—A certain quantity of gelatine is

cut into small pieces and washed clean in water, and allowed to swell up; impurities which may occur in the process of manufacture—for instance, chlorides or sulphuric acid—are thus removed. The gelatine is squeezed out four times in one hour. Then a definite quantity of water is added, and the gelatine and water placed in a water-bath of boiling water and brought to the boil, the mixture being constantly stirred with a glass rod till the whole of the gelatine is dissolved. When this has taken place a certain quantity of bichromate of potash is added and the solution mixed. In from five to eight minutes the solution is ready to use. It is filtered through flannel into a vessel which should stand in hot water. To the filtered solution ammonia is added drop by drop, the vessel being continually shaken, till the deep orange colour of the chromated gelatine appears bright green.

I must here draw the attention of my readers to the fact that in all formulæ which are to be found in books on the phototype process, the ordinary quantity of chromate salts is said to be from four to two per cent. My experiments have shown me, however, that the thinner, that is to say, the more transparent, the negative the less chromate salts should be used. If ammonia, however, is used in working, the printing continues longer than usual; in winter, on gloomy days, it need not be used at all. Too soft gelatine, which is found in the market, can be improved by adding from half to two per cent. of isinglass. The cooking of the gelatine or the coating of the plates can take place by candle or lamplight.

I may here give two formulæ for the chromated gelatine. I have obtained excellent clichés by the use of the gelatine manufactured specially for plates and the phototype process by Drenner and Co.

### FORMULA I.

Water .. .. .	1,000 parts.
Gelatine .. .. .	80 "
Potash bichromate .. .. .	16 "
Ammonia .. .. .	8 "

Or

### FORMULA II.

Water .. .. .	1,000 parts.
Gelatine .. .. .	100 "
Potash bichromate .. .. .	20 "
Chrome alum .. .. .	4—5 "

The chrome alum is first dissolved in water.

The temperature of the room plays an important part in coating the plates, especially in winter time, and it should be from 72 to 78 deg. F., otherwise the gelatine film becomes thick. The coating of the glass plate with the gelatine film should take place quickly, and one can evenly distribute the film all over the surface by means of a piece of clean paper. The coated glass is stood up to allow the excess of gelatine to drop off, and laid in the drying box, the cover of which is kept closed. The temperature is raised to 156 deg. F., and maintained regularly for 2 to 2½ hours. Then the lamp under the box is turned out, the plate allowed to cool in the box. 156 deg. F. I have practically proved to be the best temperature in order to obtain the right grain in the light sensitive chromated gelatine film. The higher the temperature is the greater and better becomes the grain, but the gelatine film acquires the tendency to give foggy, grey prints. Too low a temperature is unsatisfactory, since the bichromate of potash cannot sufficiently crystallise, and gives a series of black points on the picture. On the drying depends the number and appearance of the pulls.

After the cliché has remained for about two to three hours in the drying box, I expose it in the printing frame like ordinary light-sensitive paper. The time of exposure

is regulated by the actinism of the light and by the quantity of the chromate of potash in the solution. As a rule it continues from a quarter of an hour to six hours (in winter with a grey sky). In order to watch over the operation of printing one can open the half of the printing frame from time to time. In order to thoroughly control the operation through the ground-glass it must be wetted at the back. This process gives the possibility to continue the printing to a certain degree; still, one must remember that over-printing gives grey lights on the impressions, and, on the other hand, under-printing yields an impression without half-tones. When the printing is finished the printing frame is turned over and laid in the window; the wooden pressure back removed in order to give a supplementary exposure to the back of the film. This must be done (a) in order to isolate the substratum from the action of damp in the washing of the cliché, and (b) in order to reduce to some extent the relief of the cliché. In winter about two to five minutes' exposure is sufficient to effect this.

After this the plate is flooded with plenty of water, in a weak light, so that the soluble chromium salts of the film may be washed out. The water should be frequently changed (five or six times); in the last water the plate is allowed to lie for two hours. The cliché is now cleansed from air bubbles and placed vertically against the wall to dry. When correctly exposed, every detail is visible, with a matt surface on the glass, and the high lights appear glazed. Experience has taught me that the cliché prints much better when it is dried at the ordinary temperature of the room, which takes about six to eight hours in winter. It is risky for the film and the whole image to dry a cliché by the fire or in the oven.

When the film is thoroughly dry it is laid in a dish and flooded with the following solution:—

Water .. .. .	300 parts
Glycerine .. .. .	600 "
Hyposulphite of soda .. .. .	18 "

Care being taken that the whole of the film is covered. The plate should remain in the bath about an hour. The relief is much smaller, as one may notice by passing the finger over the surface of the cliché. The solution is poured off, and the surface carefully dried by means of a sponge or cloth, and as the film is very tender, it should not be rubbed, but carefully dried by merely laying the cloth on it.

If the cliché is finished, it may be rolled up with a roller and collotype ink. With quick movement of the roller, the ink is removed from the high lights, so that on the cliché the complete positive is visible. A cliché thus prepared is laid on to a piece of india-rubber and covered with paraffin paper. A piece of clean paper is fastened on a mask; over this is laid a thin bag of soft material stuffed with wadding. Satin is the best material for the bag, so that no structure is visible in the impressions.

A pressure of the copying press gives a good pull of the cliché. The first pulls of a plate are usually hard, because it is not yet sufficiently elastic. The more pulls one takes, however, the better and finer the prints. Finally, when the pulls show a grey tinge in the high lights, the plate is bathed in the following solution:—

Water .. .. .	100 parts
Glycerine .. .. .	100 "
Ammonia .. .. .	6 part

Washing the unexposed places of the cliché should be effected with a soft sponge; still, one should not press strongly on the glass, as the slightest injury to the light-sensitive film can spoil the whole plate. The washing is continued for one to two minutes; the moisture is removed as mentioned above. Then one can print again, and the impressions are visible with all details.

With regular and careful treatment of the clichés one can obtain a large number of pulls on any paper. Still, I must draw the attention of my readers to the fact that badly-sized paper absorbs a lot of moisture from the cliché, and therefore this requires a much more frequent damping. When one has finished printing, and it is desired to preserve the cliché, one proceeds as follows: The ink must be carefully rubbed from the plate with paper, and its surface covered with the following solution:—

Water .. .. .	500 parts
Glycerine .. .. .	150 "
Alcohol, 40° .. .. .	23 "
Potash alum .. .. .	1 "

Alcohol and alum are used to prevent the gelatine film spoiling. Glycerine is introduced into the bath to make the gelatine more elastic. A plate thus treated should be kept in a dry room. Before printing again, the plate should be laid in water for about ten minutes, then treated with the above-mentioned bath.

Although this process is quite simple and easy, it still requires considerable dexterity and practical knowledge on the part of the operator. And if the first pulls do not give perfect results the fault must be ascribed to deficient experience or some great blunder in the process. Such a phototype process needs neither dear salts nor costly machines, since one can work with the ordinary copying press. A used-up cliché is washed off in warm water, and again treated with emery, and can be used over and over again.—*Photographisches Wochenblatt.*

## Thursday Evenings at the Camera Club.

BY ONE OF OUR STAFF.

MR. ANDREW PRINGLE presided at the meeting on the 28th ult., the proceedings of which were a fine Olla Podrida, all the ingredients of which were very interesting. The interest was, however, mainly in the papers, which took so much time that there was little left for discussion. Mr. Davison showed a specimen of Benham and Froud's "Holiday" lamp, and of the London India-rubber Company's new focussing cloth.

Mr. Lyonel Clark undertook to read a paper from M. Leon Vidal on "A Combination Method of Carbon Printing and Staining for the production of Coloured Lantern and Stereoscopic Slides." He said he would like to read the paper in French, but Mr. Davison suggested that he had not the proper accent. After the laughter had subsided, Mr. Clark proceeded to read the paper, which said that the process consisted of obtaining a carbon image of a brown colour, but with very little admixture of the colouring matter; after the usual treatment, the tissue was dried and then placed in a solution of any aniline colour. That was for a single colour, but for a polychromatic effect it was necessary to have three separate negatives, one giving the red, one the yellow, and one the blue rays. From these negatives carbon transparencies should be made and stained their respective proper colours and then superimposed. At the conclusion of the paper, the Chairman said that M. Vidal had promised to send specimens, which he hoped would be on view at the following Thursday evening.

The next paper was one by Professor Burton on "A New Emulsion or Printing-out Paper." Mr. Davison was to read this paper, and it was suggested that he should read it in Japanese. He said it was not in that language, but he would ask their indulgence, as it was in the Professor's typewriting. In the course of the paper the Professor said he had often pondered over the fact that it was found necessary up to the present to salt and sensitize ordinary matt paper at different times, and at last he determined to make some experiments with a view to finding out if the two processes could be combined, by mixing the salting and sensitising solutions and applying them to the paper together. He found that this could be done. The result of the mixing was nothing more or less than a gelatine chloride

emulsion. It required no washing; was made by pouring one solution into the other, and was ready for use at once, and being liquid at an ordinary temperature it could be applied to paper or other material, either by floating or brushing over. It gave no gloss to the surface of the paper. The Professor had by no means confined himself to one formula, but has tried many, and had a fair amount of success with all; there is great elasticity in the process. In making the emulsion the quantity of gelatine must be kept as low as possible to prevent gloss on the paper, and it is necessary that there should be a large quantity of insoluble silver salt in suspension. If the gelatine be kept for a few days at a high temperature, such as that of fairly hot weather, it is probable that the salt would be found at the bottom of the bottle, but it can easily be re-emulsified. The paper treated with it will keep fairly well, as long as any other. For mixing, the two solutions should be heated to 110 degs. or 120 degs. F., and the silver solution is then slowly added to the other with much stirring, and the whole is filtered through a double thickness of cambric, when it is ready for use. It is best to coat the paper by floating for three or four minutes, and it is best to dry it quickly before a fire or near a stove. A quantity containing 400 grs. of nitrate of silver will cost ten or twelve sheets, so that the process is economical. The Professor prefers Clark's platinum toning to any other for the paper so prepared. The emulsion is easily applicable to wood, and he got very good results that way.

Mr. Lyonel Clark said that the process was entirely new as applied to matt-surface paper, though he had tried something of the same sort, but he never got a shadow of deep rich translucence. Judging from the specimens Prof. Burton had sent, and noting their great superiority over albumen prints, it was only reasonable to expect a great success for the new process. The Chairman agreed with Mr. Clark, and mentioned that there was a tendency to graininess in the shadows, but that might be due to fortuitous circumstances, and might be rectified by deliberate work. The process was very simple, the results were very promising, and all they had to do was to try it for themselves, and if they could only get as good results as those shown they might consider the process very successful.

The specimen prints sent were on Whatman paper without gloss, and of a very fine tone.

Mr. Woodward, of Birmingham, with the assistance of Mr. Stroh, then illustrated Schoppen's method of viewing lantern-slides stereoscopically. For this purpose two lanterns, side by side, were used, and two lantern-slides (taken stereoscopically) put in them. They were thrown on the screen and focussed accurately, and then in front of the right lens a red glass was placed, and in front of the left a green glass. Spectacles were provided for the audience, with a green glass for the right eye and a red one for the left, and on looking through them a decidedly stereoscopic effect was produced, the action being that the right eye saw only the red picture and the left the green. Votes of thanks having been passed to the demonstrators and readers the proceedings terminated.

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

ACTING on a suggestion by Mr. J. M. Turnbull, of Rose Street, Edinburgh, the Council of the Edinburgh Photographic Society have resolved to recommend that the Photographic Convention of Great Britain be invited to meet in Edinburgh in 1892. The Council are of opinion that if the meeting of the Convention were to be held in Edinburgh, it would be the means of stimulating interest in photographic art, and they think the Society might resolve to give the invitation. In the event of the invitation being given and accepted, it would fall to the Society to perform certain duties, and while the expenses would not be great, there would be a certain amount of outlay, to meet which a guarantee fund would be necessary. They suggest that no single guarantee should be for more than £1. A motion is on the agenda of the meeting for Wednesday last (3rd inst.), proposing that the Society should guarantee, from its funds, a sum not exceeding £10 towards the expenses of the meeting of the Convention should it come to Edinburgh. While agreeing that it is desirable that the Convention should be invited to Edinburgh, I am not sure that it falls to the Society to do the whole of the

work in connection with it. There are other photographic bodies in the district who might be willing to bear a hand in whatever is to be done, among others the Edinburgh Photographic Club, the Edinburgh University Photographic Association, and the Leith Amateur Photographic Association. Before giving the invitation, these bodies might be approached, and asked if they are willing to undertake any of the duties or responsibilities attaching to the proposal. If that were done, and the other bodies agreed, the proceedings would, doubtless, be more pleasant and interesting because of the appearance of harmony which such a step would indicate.

Notable photographs are sometimes taken in Edinburgh, than which few cities offer better advantages. The latest is that of the Right Worthy Grand Lodge of the Independent Order of Good Templars, which met in the city last week. There were representatives from all the English-speaking countries in the world, and it was thought desirable that a picture of the gathering should be secured. This was effected by means of photography in that most picturesque of all public gardens, the West Prince's Street Gardens. With the Castle, perched on its lofty rock for a background, a striking photograph ought to be the result.

Mr. W. Crooke, Prince's Street, Edinburgh, photographed the Lord High Commissioner to the Church of Scotland (the Marquis of Tweeddale) and party, in the quadrangle of Holyrood Palace, on Saturday last.

The members of the Leith Amateur Photographic Association held their fifth meeting for the present session on the evening of Tuesday week, Mr. Thomas W. Dewar in the chair. This society is always fortunate in having specimens forwarded to them by manufacturers, scarcely a meeting passing at which some novelty is not on view. At this meeting the articles shown were the new method of placing titles upon photographic prints by Mr. A. Gray, Snow Hill, London, to which the name of "Nameit" has been given; and the other was the London Rubber Company's waterproof focussing cloth, which is recommended as being, in addition to its ostensible purpose, suitable for protecting the camera, and as a shoulder cape, but whether it is equal to all three things at once is not stated. As most photographers have dust and waterproof cases for their cameras, a focussing cloth which could be used also as a cape might be handy, and the two things would be sufficient without asking it to do further duty. The technical business of the evening consisted of a paper by Mr. W. M. Smith, on "Copying," which was a sensible production. There will be no meetings of the Association during June, July, and August.

## The Picture Galleries.

EXHIBITION OF THE EARLY ENGLISH  
MASTERS' PICTURES IN OIL.

(By "LOITERER.")

At the Dowdeswell Galleries there is an extremely interesting collection of excellent examples of oil paintings by Sir Joshua Reynolds, Thomas Gainsborough, George Morland, and other representative Early English artists. This exhibition forms an admirable contrast to a previous collection shown at these galleries of works by French Romanticists. There is no necessity to-day to praise such pictures as "Dedham Village" (18), by John Constable—as well might we paint the lily. "The Mill" (37) is one of Gainsborough's best in this gallery. Sir Peter Lely is not at his best in his single contribution of "Nell Gwynn" (73). Joseph Wright is well represented in "The Shoeing Forge" (82). George Morland exhibits, in the thirty-two pictures by him, all the varied excellences which have gained for him such a valuable reputation. Every one of the 154 pictures shown in this collection merits a careful study, as exhibiting the style of oil-painting which distinguished the period of 1750-1850. A word of special commendation must be accorded to the admirable catalogue, which contains brief sketches of the artists whose work is exhibited on the walls.

**Tynemouth.**—Mr. T. O. Mawson, of 12, Percy Park Road, Tynemouth, writes us that he keeps all photographic chemicals, plates, and paper in stock. Many of our subscribers visiting the town, Cullercoats, Whitley, and the surrounding district will, we have no doubt, take an early opportunity of paying Mr. Mawson a visit.

## Apparatus.

### THE "HOLIDAY" CANDLE LAMP.

YET another photographers' lamp; not quite so wonderful as Aladdin's, but still sufficiently striking to attract, as it is sure to

OPEN FOR USE.

do, considerable attention amongst amateurs, especially those who travel much and use their bed-room as a dark-room when the exposures of the day are done. The lamp (of which we give two excellent illustrations) is substantially made of brass, lacquered, and is so constructed that it closes up into the smaller space with the removal of only the base; the latter takes off and fits easily over the glass, thus forming an admirable protector for that most delicate part of the affair. The tube containing the candle simply slides right up into the body of the lamp, and it is ready for a voyage from China to Peru. Candles are used, thus absolutely avoiding the leakage of oil or grease of any kind, and as the whole of the inside of the lamp is silvered, forming a parabolic reflector, a powerful light is obtained. The light, too, owing to the peculiar shape of the lamp, is thrown downwards and thus escapes the eye, which, in consequence, is not so soon fatigued as with the ordinary form of lamp. In addition to the glass front, coloured (which, by the bye, is not ruby), there is one of white glass, so that the lamp can also be used for a lantern lecture or for ordinary reading. Special candles are supplied, at one shilling the half-dozen, which will burn for three or four hours; the lamp itself sells at 10s. 6d., and is remarkably cheap and likely to be in great demand. The sole manufacturers and patentees are Messrs. Benham and Froud, Ltd., Chandos Street, Strand, W.C., and the lamp will be obtainable of all photographic dealers.

CLOSED.

### THE PHOTO-AUTOCOPYIST.

This is an apparatus which can be used for producing ink copies of photographs, and, judging from the specimens before us, very successfully, half tones being exceedingly well reproduced. The process is an adaptation of the bichromate of gelatine process, and is comparatively easy working. The patentee claims:—"A simple photo-autocopyist gelatine sheet replaces the formerly bichromatised glass. It is sufficient to soak it for a few minutes in a bichromatic solution of 3 per cent., to dry it in the dark-room, and to expose it to the light in a printing frame, underneath the picture to be reproduced, in the same way as you would take a copy on albumenised paper. When it is complete, the photo-autocopyist sheet must be soaked in ordinary water, until the bichromate has entirely dissolved. The sheet thus prepared will constitute the printing surface, and enable the photographer to take from it thousands of copies, which, as regards neatness, will compare very favourably with the best photographic proofs. The photo-autocopyist sheet is stretched on the grooved frame, and inked with the roller, after which the copy is produced under the copying press. These copies can be taken on any kind of paper or texture. From the photo-autocopyist sheet further indefinite numbers can be taken at intervals, even after some years." The sole licensees are the Americo-European Trading Co., Ltd., 72, London Wall, E.C., and the prices of the apparatus are, for 3½ by 4½, £2 15s.; 5½ by 7½, £3; 7½ by 9½, £3 10s.; 9½ by 12, £4; 12 by 16, £4 15s.

### THE "MARVEL" HAND-CAMERA.

This is another cheap camera, the price being only ten shillings, which is made for use with dark slides. It is for quarter plates, has a good view lens, and an ingenious shutter which can be used for either time or instantaneous exposures. The camera is well put together, covered with black American cloth. It is more than a toy.

## Holiday Resorts and Photographic Haunts.

### SKEGNESS (LINCOLNSHIRE).

THIS popular little seaside resort is situated on the shores of the Wash, about 20 miles from Boston by rail, and is easily accessible, being the terminus of a branch line of the Manchester, Sheffield, and Lincolnshire railway, who find it to their interest to foster the place, and therefore frequently run cheap trips, besides having for a branch a very fair ordinary time table. By ordinary trains passengers change at Firsby for the local train. Being situated on the borders of the "Fens" the surrounding country is flat and somewhat uninteresting, though the searcher of the picturesque would find many little bits well worth a plate, but to the ordinary photographer the chief attractions will be found in the wide, firm, far-reaching sands, the crowds of trippers, the peculiar boats, and equally peculiar way of embarking passengers thereon, and its long iron pier reaching across the sands to below low-water mark, all of which furnish material for successful "snap shooting," especially as the light is in a very good direction for such subjects and from the absence of smoke is of an unusually actinic quality.

To the student of ecclesiastical architecture the churches of this and neighbouring parishes will furnish several excellent examples of what are, I believe, known as "flint" churches. (They are noticeably squat in appearance with very short square towers which look as if they had been cut off short.) Skegness "old" church (now disused for public worship) is a fine example of this class of church architecture, and it is best taken from the south or south-west, with morning or afternoon light. Other churches in the neighbourhood well worth a plate are those of Croft (three miles from Skegness), Burgh (about five miles), Irby (a "flint church," about one and a half miles from Firsby station), and Winthorpe, which is about two or three miles from Skegness. Of these, Burgh church is far the best photographically, though it is difficult to get a satisfactory view of the outside as a whole; owing to the numerous trees in the churchyard, the best point is nearly due north at the corner of the churchyard, but as the best time to take this view is about 6 or 7 a.m. if the sun is shining, not many would care to try it, especially as, owing to the view being uphill, the apparent perspective of the church is very peculiar. The tower is a high square one, and from its top it is said twenty parish churches can be seen. The interior is, however, well worth taking, during the latter of the afternoon; the old carved oak pulpit (over 200 years old), the font, the east end lectern, etc., all being well worth separate plates, also the general view of the church from the west end. It is well lighted too, but backed plates should be used, on account of the windows.

A good pedestrian could readily take most of these churches in a day's excursion, starting from Skegness in the morning to Croft (three miles), taking this church from the S.E.; there is only one view of it to be had as a whole, so it is not likely to keep the photographer long, as there is little inside worth taking. From Croft to Burgh is two miles, and Burgh church is in plain sight all the way, so it is impossible to miss it. There are three good inns at Burgh, at any of which refreshments can be obtained. From Burgh to Irby, about two and a half miles across the fields; Irby church is only worth one plate, the view being taken from the S. or S.W. From Irby to Firsby station is about one and a half miles, and thence by train back to Skegness. The vicars of the respective churches will doubtless readily give permission to photo the interiors if applied to Burgh church is, I think, always open. Croft vicarage is quite close to the church.

There are several photographers at Skegness, and no doubt plates and chemicals, also the use of a dark-room could be easily obtained.

The light in this part of the country seems very actinic, so care should be taken not to over-expose, and the tripod used should be firm and steady, as there is generally plenty of wind at Skegness.

**A Charming Worcestershire Nook.**—Messrs. S. H. Brookes, of Cheltenham, send us a little pamphlet, "Picturesque Broadway," a place to spend a quiet holiday. A perusal of this little book (price threepence) satisfies us that the camera would be a fit companion in such a place.

## Reviews.

*Painting on Glass for the Magic Lantern.* London: Messrs. J. Barnard and Co., 19, Berners Street, London, W. 1s.

This is a very useful and practical little handbook upon painting on glass, a subject which the average run of workers in lantern slides knows nothing about; he cannot therefore do better than qualify himself by perusal of the manual, which treats of—painting on glass in water colours, painting on glass in oil colours, phantasmagoria slides in oil or water colours, concluding with a few useful hints upon “The magic lantern, and how to use it.”

*A Class Book on Light.* By R. E. STEEL, M.A., F.C.S. London: Methven and Co., 18, Bury Street, W.

A book on light is always acceptable to the student in photography, and the one before us is of an educational character, to give, as the author says in the preface, “the student clear and accurate conceptions of the elementary principles of optics.” He apologises for the *few calculations* “which those who do not know something of trigonometry may be unable to follow;” but the author adds, “such students may accept the results obtained without seriously interfering with their progress in the subject.” The book is divided into eleven chapters, viz.: Nature, source, intensity and velocity of light—Reflexion from plane surfaces—Reflexion from curved surfaces—Single refraction at plane surfaces—Refraction at curved surfaces, lenses—Dispersion—Optical instruments—The eye—Interference—Diffraction—Double refraction and polarization—Interference of polarized light. This will be sufficient to show that the subject, “light,” is very fully covered. The diagrams illustrating the writer’s remarks upon the lantern and the photographic camera are incorrect. In the former the arrangement of lenses is not such as is in practical use, and in the latter it is difficult to find where Mr. Steel has found the combination which he illustrates. The book is not, of course, written as a photographic handbook, but we cannot help thinking that the author will do well when issuing another edition to pay more attention to photographic optics, and bring his examples of the lantern objective and the photographic lens up to date. Questions are set at the end of each chapter, and a very large amount of useful knowledge upon light and optics will be acquired if the reader carefully sets himself to answer the questions. The book is one of “Methven’s Science Series” (2s. 6d.); several have been published, and others are in the press.

## Quarterly Examinations in Photography.

**Question 23.**—What is the cause of (a) want of vigour (b) mealy prints, (c) white marbly marks, (d) black marbly marks, (e) black specks in albumen prints.

**ANSWER.**—The most probable cause of all or any of these is defective negatives, but assuming the negatives perfect—

(a) Want of vigour may be due to a want of silver in the sensitizing bath, to under-printing, or too prolonged fixing and washing.

(b) Meakiness is caused by the absence of sufficient absorbent to take up all the chlorine set free by the action of light. This free chlorine attacks those particles of darkened silver-salt next it, bleaching them and bringing them back to their original state. Fuming with ammonia provides the necessary absorbent.

(c) White marbly marks are caused by a very weak bath, the water dissolving the albumen before the nitrate of silver has time to coagulate it. They may also occur through imperfect albumenising.

(d) Black marbly marks. A scum of oxide of silver formed on the top of the bath when left exposed to the air probably causes these; it ought to be removed with a strip of blotting paper before commencing work.

(e) Black specks. These are probably defects in the paper, but may be due to dust settling on the albumen before it is dry, or the print may have toned face up. S. N.

**Question 24.**—How would you set to work to reproduce an oil painting, the colours of which have to be as far as possible correctly rendered? What light would you employ—sunlight, diffused light, or lamplight?

**ANSWER.**—Lamplight, owing to its comparative weakness in blue rays, is to be preferred, using several lights (to equalize illumination), assisted by large orange-coloured reflectors.

First measure the picture and find the amount of reduction

necessary, then (the focus of the lens, which must be a rectilinear being known) calculate the conjugate foci, and place the camera and picture in their respective positions with the ground glass of the former exactly parallel with the latter. Insert the stop (a small one), and adjust any difference of focus (to do this exactly it may be necessary to remove the picture and focus on a light which must be held in the same plane as the surface of picture will occupy), and expose, using a slow plate rendered orthochromatic by erythrosine if there is much green in the picture, or by cyanine if strong in reds.

Develop with a developer weak in pyro so as to keep down the contrasts.

The conjugate foci are found by multiplying the equivalent focus by the number of times plus 1 which give the greater distance, while the answer divided by the number of times gives the second distance; for example, using a 10 in. lens to reduce three times—

Multiply 10 by (3 + 1) = 40 in., the distance from the picture to the stop.

Divide 40 by 3 = 13½ in., the distance from the stop to ground glass. S. N.

## Societies' Meetings.

**Brighton.**—The Brighton Photographic Society made an excursion to Lindfield on the 30th ult. Only a few members participated in the trip, but those who went were favoured with beautiful weather, and had a very enjoyable day. After taking several views they had tea together at the Railway Hotel, Hayward’s Heath.

**Brixton and Clapham.**—On the 23rd ult. nineteen members of the Club travelled down to Bexley, by invitation of the President, Mr. A. R. Dresser. After several shots at the church, farmyard, etc., the whole of the cameras belonging to the party were levelled at some sixty or seventy cows, which had gone down to water at the river. This over, a photograph of the party was taken. The members then roamed about, some in the farm, others by the river, until six o’clock, when all sat down to a substantial tea, which had been provided by the President, and after a long afternoon was thoroughly appreciated. The weather, a contrast to last year, was beautiful, and a total of 170 plates were exposed.

**Dukinfield.**—An ordinary meeting was held on the 26th ult., the President, Mr. J. T. Lees, in the chair. The Hon. Sec. exhibited a sample of waterproof focussing cloth. The President made a few remarks on the arrangements for weekly demonstrations and outdoor meetings, and urged on the members the advantages to be gained by attending the same. Mr. Shirley explained his apparatus for enlarging, etc. The President explained, with the aid of diagrams on the screen, methods of enlarging by daylight and also by artificial light. Enlargements were then made on plates by the President, and on paper by Mr. Shirley, which were very successful. A vote of thanks to the demonstrators brought a very interesting meeting to a close.

**Faversham.**—The outdoor excursions of this Society were inaugurated for the season on the 26th ult., by a journey to Chilham. Through the kindness of Colonel Hardy the members were admitted to the fine grounds surrounding the castle, where many objects worthy of attention were met with. A number of plates were exposed in the village and neighbourhood, and being favoured by the weather it proved to be the most successful and enjoyable excursion the members have had.

**Glenalmond.**—The fortnightly meeting was held on the 30th ult., the President in the chair. After some business had been discussed and settled, the President remarked that the club had to decide upon the subject for a photograph for which a prize would be given by one of the masters of the college. After some discussion it was settled that the prize should be given for the best set of three photographs of river or burn scenery within walking distance. It was left to the Committee to bring up further details about it by the next meeting. The meeting then became general to inspect some photographs shown by Messrs. Maxwell, and some instantaneous ones by the President. The meeting then adjourned till Saturday, June 13th.

**Hackney.**—The ordinary meeting was held on the 28th ult. Mr. Beckett presided. The new system recently brought into operation worked well, as there was plenty of discussion, the work of Messrs. Sodean (microscopical work), Grant (Fry’s naturalistic paper), S. H. Barton (toned ditto), Gregg (hand-camera work), causing much comment thereon. The following excursions were arranged for the next two months:—June 13th, to Dorking; 27th, Waltham Cross; July 11th, up the Thames; and 25th, to Hampton Court. Mr. Beckett then gave an excellent paper on “Elementary Work,” and gave as his preference a quarter-plate camera, single lens, one and a half or twice length of the plate, half-plate tripod for quarter-plate camera to ensure greater rapidity, and the slowest plate that could be obtained. For development he preferred pyro, and gave as an excellent formula—(A) 1 oz. pyro, 3 oz. sulphite soda, 16 grs. citric

acid, water to 16 ozs. (B) saturated solution carb. soda, with sal ammonia, or roughly for saturation, 6 ozs. sulphite to 1 sal ammonia. For use—A, 10 minims; B, 1 drachm; water, 1 oz. He had found a mixture of eikonogen and hydroquinone work well, and very nearly equal pyro. For exposure the best method was by making notes of those plates which had been exposed, and comparing. Dr. Roland Smith said he had found a good way of bringing out under-exposed plates was by first using pyro and then following with quinol. A lengthy discussion then ensued, in which Messrs. Grant, Gosling, Dean, Gregg, Barton, and others took part.

**Holborn.**—Anybody strolling into the Holborn Camera Club room on the 29th ult. would have been taken aback to see the large number of hand-cameras pointing at him as he entered the room. But the "dreaded click" did not take place, and, gaining confidence again, he doubtless would go in and examine the instruments. Owing to the bad weather on Friday, the show, however, was not so good as had been expected. Many manufacturers did not show their hand-cameras. The novelty of the evening was, however, a stereoscopic hand-camera, shown by Mr. Raphael, which, by a sliding arrangement of the front, could be used as a quarter-plate as well as a stereoscopic hand-camera. Mr. Arthur R. Gowing was elected a member of the Club.

**Kendal.**—The monthly meeting was held on the 27th ult., Mr. Frank Wilson in the chair. After the transaction of business matters, the chairman read a paper on "Photographic Work for the Arts and Crafts Exhibition." The paper dealt with the prizes offered in this subject, but more especially with those confined to amateurs. Mr. Wilson had coloured a map showing the Kendal six miles radius and the confines of the exhibition area. Much information regarding "bits" of landscape and river scenery was given, whilst the old buildings of Kendal were described. The question of rules was again deferred. Field meetings for both Thursdays and Saturdays were arranged.

**Liverpool.**—The fourth ordinary meeting of the twenty-eighth session was held on the 28th ult. Mr. Paul Lange presided, and there was a numerous attendance. The following gentlemen were unanimously elected members of the association, viz., Messrs. Thomas Rome, Anthony Dod, John Wells, and F. E. Patchett. Mr. Paul Lange reported on the excursion to Chirk, which took place on Saturday, 9th May. Twenty-one members turned up, and although the day was dull some good photographs were taken, and a very enjoyable time was spent in the castle and neighbourhood. The Hon. Secretary exhibited the London Rubber Co.'s new waterproof focussing cloth. Mr. B. Boothroyd, Chadwick's new hand-camera, fitted with Swift's special lens working at  $f/4$  ( $4\frac{1}{2}$  inch focus). Dr. Manton, president of the Sheffield and District Optical Lantern Society, then proceeded to give a most interesting paper and demonstration on the "Carbon Process," and on the motion of Mr. B. Boothroyd, a hearty vote of thanks was accorded to that gentleman for his lecture, and the proceedings terminated.

**Lowestoft.**—A meeting was held on the 29th ult. Mr. W. Stringfield, the chairman, presided. Negatives, prints, and slides were exhibited by Mrs. J. Lee Barber, Messrs. Escourt, J. Rose, A. M. Smith, W. R. Smith, and others, and discussions thereon followed.—The stereoscopic "snap shots" of different parts of London, taken from the top of an omnibus by Mr. Escourt, were highly appreciated, the lantern slides of Old Lowestoft taken from negatives made forty years ago, exhibited by Mr. James Rose, were the feature of the evening, and Mr. A. M. Smith's slides of the neighbourhood, principally Oulton, are works of great merit. Mr. W. R. Simson also exhibited a few nice photo. micro. slides.

**Richmond.**—At the meeting on the 29th ult., Mr. Ford presided. The subject for discussion was "Finishing and Mounting Prints," which was pretty thoroughly thrashed out.

**Sheffield Camera Club.**—A general meeting of the above club was held on Wednesday, May 27th, when an exhibition of about 180 prize slides, kindly lent by the Editor of the "AMATEUR PHOTOGRAPHER," took place. There was a good attendance of members, who highly appreciated the great variety of views put on the screen.

**Sydenham.**—An ordinary meeting was held on the 26th ult., the President in the chair. Mr. T. W. Rumble reported that he and Mr. Gray had attended the meeting of delegates at the rooms of the Photographic Society of Great Britain, to discuss the Federation Scheme, and that it had been decided that nothing should be done until the Parent Society had brought forward its scheme of affiliation or had abandoned it altogether. Mr. Reynolds read a paper on "The Dark-room and its Appliances." It was a most carefully prepared and studied paper, with a number of diagrams showing the best means of ventilation, lighting, and the arranging of the dark-room. These were handed round for examination. He was of the opinion that electric light was the best light for the dark-room, through at present that was out of the question for most amateurs. It was announced that the first summer outing would take place on June 6th, and members were requested to inform the Secretary of their intention of joining.

**The Phot. Soc.**—The monthly technical meeting was held on the

26th ult., Capt. W. de W. Abney, C.B., R.E., F.R.S., in the chair. The Chairman read a communication from Mons. Paul Nadar on a magnesium lamp that could be used either to give a flash-light or to give a steady magnesium flame. He also read a note upon Halation, by Mons. Nadar, and exhibited some specimen prints from negatives taken with this light. Mr. Addenbrooke opened the discussion on the "Influence of Development on Gradation."

**Tunbridge Wells.**—The members of the above association held their first excursion of the season on the 30th ult., when, by the kind permission of Mr. Edward Hussey, they were enabled to pay a visit to Scotney Castle. The old castle was a castellated mansion of considerable extent, surrounded by a moat, and appears to have been occupied by a family of some consequence, Walter de Scotney, Steward of the Earl of Gloucester, holding it in 1258, and his descendants continuing in possession of it until the time of Edward III. In the middle of the fifteenth century it was in the possession of the Darell family, whose ancestor was one of the followers of William the Conqueror, with whom it remained till the year 1774. It was a square building, having a round machicolated tower at each corner, with intermediate buildings; one of these only remains, that at the south entrance. The lantern on the top is evidently of modern date as compared with the original building. A portion of the gate-house is still remaining, and also part of an ancient mansion, the latter of which was designed by Inigo Jones. The entrance to the principal rooms appears to have been in the first court; the stone steps leading to it and the door are yet standing. In the inner wall at the end of the kitchen, nearly at the top of it, is a small aperture which is thought to have been a private entrance to a closed or secret place in the lower part of the building. It is said this was one of the seats of Archbishop Chicheley, and from the spacious moat it is easy to imagine that Scotney must in the olden time have been a right lordly dwelling. Coins have been found, and in cleaning out the moat some broken glass bottles were found at the bottom of it with all the hues of the rainbow upon them, evidently produced by the qualities of the water. The modern mansion stands on high ground overlooking the old ruins and only a short distance from them. The architect was Mr. Anthony Calvin, who was celebrated for his designs in the Tudor style of architecture. Over the principal entrance in the west front are the family arms richly carved in stone with the motto "Vix eii nostri voco," and underneath, in old English characters, is the following appropriate couplet:—

Health and happiness attends  
The coming and the parting Friends.

In the gable, over the kitchen window, also in old English, is the following:—

Upon ye settled Rooke thy building surest standes;  
Away it quickly weares, that resteth on ye sandes.  
Dame Virtue is ye Rooke that yeldes assured stay.  
Dame Fortune is ye sande that skowreth soone away.

The owner hospitably invited the members to tea. The party returned through Frant, highly delighted with their excursion as to weather, drive, and unexpected scenery, and their cordial reception.

**Compound Sulphokinone Developer.**—The Fry Manufacturing Company, 5, Chandos Street, W.C., and Kingston-on-Thames, have sent us samples of their "Sulphokinone Developer," which is made upon a thoroughly reliable formula, and in our hands has given first-class results. The developer is in two solutions, which, when the plate has been correctly exposed, should be used in equal parts. When over-exposed, the proportion of the A solution is increased, and when under-exposed, the proportion of B solution is increased. The best results are obtained with a correctly exposed plate, and when using the developer in equal parts. The developer may be used several times until the developing power is exhausted. The tourist will find Messrs. Fry's developer very handy; it is packed securely, and can be sent by post safely.

**The Universal Camera.**—Mr. A. Brooker, the very energetic secretary of the Hastings and St. Leonards Photographic Society, has sent us a description of his Universal camera, which appears to have many advantages, viz.: Outside measurement,  $8\frac{1}{2}$  by  $6\frac{1}{2}$  by  $5\frac{1}{2}$ : weight with three dark slides,  $3\frac{1}{2}$  lbs.; only one projection; the milled head for focussing made to take any lens from  $3\frac{1}{2}$  to 8 ins. equivalent focus. Has a shutter always ready, behind the lens, which can be used or not as required; all the movements of the ordinary camera, including focussing screen, rising and falling front for architectural or street views, and dark chamber doing away with the use of a focussing cloth. A roller slide can be adjusted. The dark slides pack inside the camera, and the whole locks up. There are many other advantages, and our readers will do well to send to Mr. Brooker, 52a, Robertson Road, Hastings, for his prospectus. Visitors to Hastings will find at Mr. Brooker's an excellent selection of photographic materials and many specialities.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

**4727. Mounting Solution.**—How can Marion's mounting solution be diluted for use when it becomes too thick? Will the addition of methylated spirit do, or if not, what else?—**C. R. F.**

**4728. Wide-Angle Lens.**—Would you kindly tell me the best wide-angle lens to cover a  $\frac{3}{4}$  by 5 plate for photographing in confined places? Is a portable Euryscope wide enough?—**PRIM.**

**4729. Eastman's Films.**—Will someone please tell me their formula for developing Eastman's films (extra rapid), as what I use is so very slow?—**H. I. C.**

**4730. Mounts.**—Can any one tell me the address of a house in London where I can get a variety of mounts to suit photographs all shapes and sizes?—**H. I. C.**

**4731. Retouching.**—Will some one kindly tell me how to darken hair which prints too light a colour? I have tried the effect of scratching the film on the negative, but that is not successful.—**H. I. C.**

**4732. Dark Room, Earl's Court.**—Could any one tell me where it is possible to develop plates whenever desired in the neighbourhood of Earl's Court, as where I am staying there is no accommodation? Is there any society in that part; if so, which? I would wish to have access to the dark-room any time.—**N. M. H.**

**4733. Intensifying.**—Could any of the readers of the **AMATEUR PHOTOGRAPHER** inform me the safest solution for intensifying negatives? I have been informed that sal ammoniac  $\frac{1}{2}$  oz., bichloride of mercury  $\frac{1}{2}$  oz., and water 5 oz. make a very good solution for intensifying negatives, but I have heard that it is not fit to be in any amateur photographer's hands, unless he or she knows well what they are using and how to use it, as it is a most dangerous solution. I have been to chemists for bichloride of mercury (for the above solution) who I know quite well, and when I informed them that I wanted  $\frac{1}{2}$  oz. they said the least drop would kill a person. They asked me a number of questions, etc., for information, when they refused to sell me any; they said they would not sell any to any person unless they had ample information. I do not want any solution with quite such dangerous chemicals in, but one which when I have used I can be more sure of being alive the next day than I could if I used the above described solution (provided what I was informed is correct). A hint will oblige.—**W. H. ELLIS.**

**4734. Films, Exposure for in Norway.**—A lady who is going to Norway wishes to know if it is advisable to take films, if so, what kind, and an average exposure with R. R. lens, Kouch's French?—**INSTOW.**

**4735. Photographical Society, York.**—Will the Secretary of the York Amateur Photographic Society communicate with "ALPERUM" (address with Editor)?

**4736. Exposures.**—Can any one tell me what is the minimum and maximum speed of the Automatique shutter? It is not in the list in the "Annual." I should also like to know what is considered to be the shortest possible time exposure with the pneumatic ball. It seems rather under a quarter of a second. Is any shutter to be had that works after a few minutes, so that the photographer might have time to introduce himself into the picture, where other figures cannot be got?—**J. C. OLIPHANT.**

**4737. Quick Printing.**—In reply to a question on

this subject, I see in "Amateur Photographer's Annual" that ferri-cyanide paper is recommended from Mr. Gutz, Buckingham Street, Strand. But on enquiring about this paper I find it is only to be had in a roll of 20 yards long and 204 metres wide! Rather a large order for an amateur. Can any of your readers tell me whether this same paper can be bought in cut sizes? The paper is No. 15, and the print would be sepia on a duck-egg green ground.—**X.**

**4738. Dark Room.**—Will some one please report on the dark-room manufactured by Davenport and Co., of Camberwell, price 30s., as advertised in **AMATEUR PHOTOGRAPHER**? Is it thoroughly well made and reliable in every respect? The chief thing is, is it perfectly light tight? Also is it easily put together?—**DEEMSTER.**

**4739. Gold Chloride.**—Can any reader kindly inform me through the medium of the **AMATEUR PHOTOGRAPHER**, in how much water I ought to dissolve a 15 gr. chloride of gold tube, and also how long the solution will keep?—**DEEMSTER.**

**4740. Camera on Bicycle.**—I wish to know whether I could carry a half-plate camera on the ordinary fixed luggage carrier of a safety bicycle, or if it would be apt to get damaged by the vibration. I have a spring carrier also, but when touring I intended to carry plates and the double dark slides on it, the camera to go on the fixed carrier. I shall be obliged if some brother-cyclo-photographer would kindly help me in this matter.—**A. M.**

**4741. Matt-Surface Paper.**—Can any reader suggest a printing-out paper that will give various tones (say from brown or purple to black), matt-surface preferred? I have been using bromide for some time, but find that many of the smaller details are quite lost and there is difficulty in printing in clouds, etc. There are many papers, I know, advertised, but I have not sufficient time to experiment, and thought some kind friend would be able to say from experience. I want a paper to answer for all purposes so that I can get warm or cold tones at will. Please give toning formulae.—**MERCUR.**

**4742. Copying.**—I have had occasion lately to copy some photographs, and have done so in daylight, but find on development of negative that the grain of paper shows so distinctly as to give the subsequent print a mottled appearance. Can this be obviated by copying by lamplight, or any other way?—**MERCUR.**

**4743. Good Half-Plate Lens.**—Can any fellow reader tell me where I can purchase a good half-plate lens (second-hand would do) for groups, views, portraits, and outdoor work, so that I can pay for it by instalments?—**BEGINNER.**

**4744. Wiesbaden.**—I am going to spend a few months at the above and intend taking my camera, and would be very much obliged if any of your readers could give me any information as to whether I shall have any difficulty with the customs or in photographing in the neighbourhood, and where will I be able to get English plates?—**UTTER STRANGER.**

**4745. Bromide Printing.**—Will some bromide worker kindly say why my prints turn a slaty grey instead of a rich black (Eastman's slow paper)?—**COPTIC.**

**4746. Beige Lamp.**—Will any brother amateur kindly tell me where I can obtain one, or if a No. 5 Bray's gas burner would do, and oblige.—**ENLARGER.**

**4747. Photographs Wanted.**—Where can I get photographs of the following?—(1) The recess in the wall formerly used as the Easter sepulchre in Heekington (Lincoln) and Patington (Yorks); (2) the altar tombs of the Black Prince at Canterbury, and the Earl of Portland at Winchester; (3) the oak altar tombs at Boxted, Gayton (Suffolk), and Little Horkeley (Essex); (4) the altar tomb of Henry, Lord Marney, at Layer Marney, Essex, showing the small altar attached. And of any curious old altars, wood or stone.—**C. F. YONGE** (address with Editor).

**4748. Dark Room.**—A lady amateur requires the use of a dark-room near the Marble Arch, and will be glad to hear from an amateur or professional photographer or dealer who could let her have the use of a dark-room. Address with Editor.—**WYNDHAM.**

**4749. Scotland.**—For a person who has travelling facilities on whole of Caledonian Railway, but who is a stranger to Scotland, what places thereon would be most central and desirable for a fortnight's holiday in July, from which daily photographic excursions could be taken? Moderate tariff a necessity.—**CALEDONIAN.**

**4750. Bellows, Cracking of.**—Is there a way to prevent camera bellows from cracking, that have been coated with shellac varnish?—**W. BECK.**

**4751. Paris.**—Will someone kindly state a good time for visiting Paris, as regards fêtes, etc., this year, a good hotel, or can Cook's be recommended, the principal views to photograph, and their times, as well as where permission is to be obtained when required? Is permission wanted for street views? How is the light for rapidity, and any other information useful for a ten days' stay?—**RED ROSE.**

## QUERIES UNANSWERED.

May 29.—No. 4709, 4711, 4712, 4713, 4717, 4523, 4726.

## ANSWERS.

**4617. Tripod Stands.**—Lancaster's tripods are as cheap and as good as any stands in the market. The decision as to the best entirely depends upon what class you want—three, four, or two fold. This can only be decided by inspection.—**OSIRIS.**

**4647. Tripod Stands.**—In reply to "Piper's" query, it is rather difficult to say which of Lancaster's stands are the best; they are all as good and as cheap as any person could wish for, but there are other makes quite as good and cheap. Get a friend to advise you.—**W. H. ELLIS.**

**4618. Hare's Camera.**—It is possible to obtain not only equal results with a Taylor's lens stopped down as with a Dallmeyer or Ross, but the definition is quite as fine, aperture for aperture.—**OSIRIS.**

**4653. Slowest Exposure, Kershaw Shutter.**—About one-fifth second.—**OSIRIS.**

**4654. Increase of Speed, Kershaw Shutter.**—As the speed of this shutter varies with almost everyone, it is impossible to say, but if the slowest speed is  $\frac{1}{100}$  and the highest  $\frac{1}{10}$ , you might be able to calculate out roughly the speed obtained with each turn.—**OSIRIS.**

**4355. Potash Developer.**—Add, as required, a few drops of:

Caustic potash ... .. 60 gr.  
Distilled water, to make, ... 3 fluid drms.

By adding this as required for each plate the speed of the developer is practically unlimited.—**E. J. WALL.**

**4659. Reproduction.**—The following list is fairly complete:—Silver processes: plain salted, matt-surface, albumen, collodio chloride, gelatino-chloride, and resin paper. Processes without silver: Ober-netter's copper, cyanotype, Pallet's, ink process, chromate paper, Hunt's chromotype, Willis's aniline process, the powder process, Sobach's anthrako-type, Itterheim's negro-graphic process, platinotype hot and cold and printing-out, sepia-type, kallotype, carbon. Of photomechanical processes we have, photolithography, photogravure, photozincography, papyrotint, collotype, and all the little variations introduced by commercial firms. Autotype is the same as carbon.—**OSIRIS.**

**4675. Photogravure.**—A great deal depends upon how many copies you want. Your best plan would be to write to Mr. W. T. Wilkinson, 14, Duke Street, Adelphi, W., who has helped me.—**PHOTO-LITRO.**

**4676. Negative for Process Work.**—I have not been able to copy such a subject yet successfully. I generally give a fairly short exposure, develop for short time only, fix, wash, and obtain density by continued intensification.—**PHOTO-LITRO.**

**4679. Elko and Hydro.**—Try the formula recommended in the Editorial column of **AMATEUR PHOTOGRAPHER** of March 13th, which gives excellent results.—**BOB.**

**4693. Cutting Paper.**—Any manufacturer who stamps paper in this way should have his paper refused, and it is only usual to stamp one edge of the paper. I fold my paper as follows: I first cut a strip off one end of the paper, which strip measures 3 by 17½ in.; this divided into four pieces gives me four 3 by 4½ pieces, which do for cartes; I then fold the remainder of the sheet down the middle and get two pieces 8½ by 19½; each piece is now folded in half again and I get four pieces 4½ by 19½; each piece is again folded into three, so I get twelve pieces 4½ by 6½, some of which have, of course, the maker's name on, but this I can generally trim off without any loss in artistic result. If you trim off  $\frac{1}{2}$  in., I fail to see how you can anyhow get more than nine pieces out, measuring fully 6½ by 4½. Can you not allow rather less, considering the rebate of negative, which is nearly always about  $\frac{1}{4}$  in.?—**OSIRIS.**

**4695. Instantaneous Shutter.**—Newman's new shutter, 40s.; or his old one, 30s.; Lancaster's Chronolux.—**OSIRIS.**

**4392. Optimus Magazine Camera.**—A good deep orange glass, as obtained from most dealers, can be used with safety. Haes' Perfection candle lamp is perfectly safe, or Parkens would supply you with an orange lamp. When plates habitually stick in consequence of being on glass of irregular thickness, the best plan is to try another plate. I have used Paget's or Thomas's "Cyclist" for some time and never had one too thick yet.—**BOB BOLT.**

**4694. Stained Negative.**—There are seven or eight different methods of intensification; which was used? Probably the negative was not free from hypo, but no help can be given till the method of intensification is known.—**OSIRIS.**

**4694. Stained Negative.**—In answer to "W. R. P.'s" query, I should think he had the intensifying solution too strong, or he kept the negative in it for too long a time. Either of these will help to stain the negative.—**W. H. ELLIS.**

**4698. Barnet Plate, Rapidity of.**—About 22 on Warnerke's sensitizer, or about double as quick as Ilford ordinary.—**OSIRIS.**

**4698. Barnet Plate, Rapidity of.**—I have tried both the Barnet and Ilford plates of each rapidity, viz., ordinary, rapid, special rapid, and I think as far as my experience goes that there is very little difference, if any, between the Barnet and Ilford ordinary plates, but I have always found that the Barnet plates give much better negatives in every line of photography, and I should ask you to buy

dozen and try. I can recommend you Lockyer's hydroquinone developer, which costs, viz., half-pint, 1s. 3d.; one pint, 2s. It can only be got at Lockyer's, the manufacturers, 88, Evelyn Street, Deptford, S.E., and of two special agents, viz., W. Edwards and Son, 157, Queen Victoria Street, E.C.; and J. Fallowfield, Lower Marsh, Lambeth, S.E. You will find it will be a very good and cheap developer, and it will give the details in every case (provided the picture taken was focussed clear), and it will suit any rapidity of plates. Patience is of course required. Regretting you should have waited so long for this reply.—W. H. ELLIS.

4699. **Carbutt's Orthochromatic Films.**—Carbutt's films are, if anything, superior to Edwards' plates in giving colour values. They are more sensitive to orange than Edwards', and certainly give less halation and are quite as thickly coated. I have used them for some time with satisfaction, and tried them last winter abroad on Alpine snow scenes with much finer results than with Edwards' plates.—E. UNUM.

4708. **Hand-Camera.**—The Talmer perfected hand-camera, either with single or rectilinear lens, would suit you well; independently of its optical qualities, which are really excellent, its mechanical arrangement and construction offer advantages which place it far away ahead of anything else I have yet seen. I have exposed many dozens of plates with one of these instruments, and can recommend the camera strongly. If you write to me direct I could let you see some results.—SECRETARY (address with Editor).

4710. **Focussing Screen.**—I have seen Mr. Fitch's, of Angel Road, Brixton, S.W., advertisements for supplying celluloid in the place of glass for focussing screens, and no doubt he will furnish all information by writing to him.—F. W. WALTER.

4713. **Stickphast.**—I have used this for mounting a good many prints, and, as far as I can see, it has not injured them. On a print on Obernetter matt-surface paper a yellow stain appeared after mounting, but as others have remained unaltered, I think it can't have been the paste.—T. WIRRMUR.

4713. **Stickphast.**—This is very unsuitable for mounting photographs, as it contains acetic acid, which causes quick fading. The best mountant I have ever used is that mentioned by Mr. Wall in his "Dictionary." Soak 200 gr. of soft gelatine in 6 oz. of distilled water for an hour. Dissolve by the aid of a water bath, and add, in small quantities at a time, methylated spirit  $\frac{1}{2}$  oz., stirring constantly; allow it to set. Should any spirit separate out, it should be re-melted, and a little more water added. The product should be a pure milk-white firm jelly. A little carbolic acid may be added if desired. When required for use, melt by the aid of hot water or a water bath.—P. R. S.

4713. **Stickphast.**—For an all-round mountant I can thoroughly recommend one made from Mr. W. E. Henry's formula, given in this year's "British Journal of Photography Almanac," page 648:—

Bermuda arrowroot (best) ...	3½ oz.
Gelatine (finest) ...	160 gr.
Methylated spirits ...	2 oz.
Carbolic acid (pure) ...	12 minims.
Water (cold) ...	30 oz.

Mix arrowroot into stiff cream with about 10 oz. of the water (Mr. Henry says 2 oz., but it is easier work with 10), while the gelatine is soaking in remainder. When the gelatine is softened and the arrowroot well mixed, pour all together into an iron saucepan and bring to boiling point; keep at this heat for about five minutes, being particularly careful to stir continually, from the moment the mixture is placed on the fire. When sufficiently cooked, pour into a basin to cool; when cool, add the carbolic acid and spirit, mixed, in a thin stream with constant stirring, being careful to work this into the mixture gradually, as it will assimilate much more easily and quickly than if put in all at once; then bottle and keep well corked. A 2 lb. jam jar or pickle pot will take this quantity well, and is easy to work with. This looks like a deal of trouble, but it amply repays in effectiveness, cleanliness, and good keeping qualities.—THE O'KELLY.

4715. **Optical Contact.**—If you mean to strip the print from the glass again, polish one side of glass with French chalk, squeegee print on whilst wet, and, when dry, strip off. This method, of course, is not suitable for albumenised papers.—PEN.

4715. **Optical Contact.**—By which, I suppose, the querist means the method of mounting prints as *opales* is achieved by soaking the print in a warm solution of gelatine made by dissolving about 2 oz. (soaked over-night till soft) in about 20 oz. of hot water, and then placing it face downwards on the glass, which must be scrupulously clean, and squeegeeing firmly down. When dry, it will be in optical contact with the glass, and quite hard. There are more details than this, which the querist can get if he likes by writing to Messrs. Percy Lund and Co., St. John's Street, Bradford, Yorks.—R. A. B. BENNETT.

4718. **Hire-Purchase.**—Cameras can be had on the hire system by writing to Messrs. Goy, Ltd., Leadenhall Street, E.C., for their forms.—F. W. WALTER.

4718. **Hire-Purchase.**—"Joan" can obtain Underwood's or Lancaster's cameras from Messrs. Riley Brothers, 5, Cheapside, Bradford, Yorks. If "Joan" requires further particulars as to terms, etc., I will

answer, as I have purchased my camera from them, and have just sent last payment.—ALPERUM (address with Editor).

4719. **Rough Surface on Negative.**—Probably due to lime in washing water, especially if you use ferrous oxalate developer. Rub negative before drying with a tuft of cotton wool under the tap. If that fails, soak for a few minutes in a one per cent. mixture of hydrochloric acid.—PEN.

4720. **Hand-Camera.**—Messrs. Sharp and Hitchmough, of Liverpool, will adapt any ordinary camera to a case, so as to be used as a detective camera, after P. Lange's pattern. Lancaster's Instantograph lens is only suitable for sea and sky studies.—PEN.

4720. **Hand-Camera.**—Yes; why not? You have only to set the shutter at its quickest speed and hold the camera in your hand. If you make a neat box with a handle, to contain the camera, you will make a more elegant affair of it. Of course, you will want a hole in front for lens to look through and a hole at side or bottom, through which a wire passes, which, when pulled, lets off the shutter. The front ought to let down on hinges for convenience in setting shutter. If you can get to see the last volume of "Amateur Work" you will find in that full instructions for making a case for this very camera.—R. A. B. BENNETT.

4721. **Instantograph Lens.**—It will not cover when rising front is used to full extent, nor (in my case) when taking views upright way of plate.—PEN.

4721. **Instantograph Lens.**—In answer to "Swiss" query as to whether the lens of Lancaster's quarter-plate Instantograph covers the whole of the plate when the front is raised, I think "Swiss" must have raised the front to such an extent that light got through the camera, and, of course, the lens was not full on the plate. The lens covers the whole of the plate so long as the front is not raised so as light gets through the camera. There ought to be a screw, so as to prevent the front from raising too high.—W. H. ELLIS.

4722. **Toning Bath.**—In reply to "Swiss" query, I should think he either had the toning bath too warm, or he did not wash the prints enough in the water before putting them in the toning bath, with the result that there was a quantity of silver on each print, which prevented the toning solution from performing properly on the prints; or he tried to tone too many prints at a time; or he did not let the toning solution, after he had made it, stand for about twelve hours; or he did not measure the chemicals, when preparing the toning bath, correctly. Any of the above are bound to make a certain amount of difference to the prints when toning, especially the last. Never put more than six prints into the toning bath at a time, never put your prints into a toning bath in the summer warm and only lukewarm in the winter, always tone your prints as soon as possible after printing, always put your prints into cold water before toning, and keep them on the move, and do not let any stick together, and every few minutes change the water, and keep on doing so for about twenty minutes, then the prints will be ready to be toned. I give you a formula for a toning bath which I have used myself for some time, and have always had very good results, viz.: (A) Chloride of gold, 15 gr. (one tube); (B) Acetate of soda, 1 oz.; (C) Bicarbonate of soda, 1 dr.; (D) Water (distilled), 15 oz. A costs 2s., B 2d., C 3d.—2s. 5d. This solution must be kept for about twelve hours, after it has been made, before using. When using, take 1 oz. of this solution to 8 oz. of water; this will tone twenty quarter-plate prints and ten half-plate. They will take from fifteen to twenty minutes to tone. Then put the prints in a fixing solution made of hyposulphite of soda 5 oz. (3d. per lb.), and water 20 oz. Keep the prints in this for fifteen minutes, and then put them into cold water for four hours, and then they can be dried and mounted. Re "untuned prints faded," trim your prints before toning.—W. H. ELLIS.

4724. **Metal Slides.**—Some I used last summer were not light-tight, and though the purchaser returned them to the makers, they were never really satisfactory.—PEN.

4724. **Metal Slides.**—I have used Tylar's metal slides for over two years, and consider them perfect and in all respects satisfactory. I left a dry plate in one, not exposed for over twelve months, lying in my kitchen; I then exposed it, with capital results, taking a photograph of a horse.—A. B.

4724. **Metal Slides.**—I should think "E. H. K." would do well in purchasing a few of Tylar's metal dark-slides. I have always found them perfectly light-tight, and stand more handling than the mahogany slides, and in every way most reliable and satisfactory.—W. H. ELLIS.

4725. **Bromide Paper.**—Get a good powerful oil lamp, and expose to that in your dark-room, or use your developing lamp. Exposure must be longer than with gas.—PEN.

4725. **Bromide Paper.**—If A. Groves will communicate his address with me through Editor, I will give him particulars he requires, as they are too long for these columns.—ALPERUM (address with Editor).

4725. **Bromide Paper.**—Waste of trouble. Light a match in front of the frame, and keep it burning close to it for the required number of seconds; or

have a ruby lamp and take off the shade, leaving the flame exposed in front of the negative for the required time, which experience will soon teach you. Gas is by no means essential.—R. A. B. BENNETT.

4725. **Bromide Paper.**—In reply to A. Groves, I do not think his query is at all clear to understand. As far as I know, there is only one way of exposing bromide paper, and this he has done. I have always had good results by exposing my bromide paper exactly the same way as he states in his query, but he does not say what results he has had, whether good or bad. A little clearer query might be better understood. What is his complaint?—W. H. ELLIS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PRO:

J. B.—1. Neither your friend nor you yourself would be able to detect the slightest difference between the working action of the two lenses, unless you had an optical bench and examined them for the secondary spectrum, therefore, we say that, considering the increase in price, which is counter-balanced in our opinion by a larger aperture, you had better stick to our first recommendation. 2. We cannot possibly see what use a wide angle landscape lens will be, wide angle lenses are instruments which should only be used in situations where a longer focus lens is out of the question; the nearer the focus of a lens approaches the normal distance at which a picture is examined, which may be taken as about eighteen inches, the truer the perspective and the more pleasing the results, artistically, when so examined. We therefore say, do not get a wide angle landscape lens; if necessary, you can easily use your short focus rectilinear. 3. Yes, practically the 12in. single lens would be the one of the greatest use, or at least the one we should use in nine cases out of ten. We shall be pleased to see you if you can give us a call some Monday when in town.

INSTANS.—Either the Thornton-Pickard or Underwood's blind shutter may be relied on.

ALPERUM.—The plates were all right. We hope to send you back the box and negatives shortly. They were correctly exposed, but rather poor in artistic qualities.

1891.—You can use either lens, and the focal length will be doubled and the exposure quadrupled.

E. W. MALE.—1. The time required for carbon printing is of course dependent upon the character of the negative and the actinic power of the light; as a safe limit, we may say from one half to one third of the time required for ordinary albumen paper under similar conditions. 2. The standard tints are obtained by making a pigment agree in colour and tint with a piece of albumen paper exposed for a certain time, which is found by experiment to be sufficient for a thin negative. 3. If exposed prints are kept in a dry place, there is no "continuing action" of light. You would be quite safe to develop in the evening prints which had been exposed in the day. 4. The Autotype Company, New Oxford-street, W.C., or the Woodburytype Company, 157, Great Portland-street, London, W.; see our advertisements, page iii. 5. We are sorry, but we can give you no formula for this—it would be preferable for you to buy the tissue ready made—we will, however, if you like, hunt out a formula, if you let us know.

F. G. H.—The plates are quite suitable, but personally we should prefer a more rapid plate like the Paget xxxxx, which will give excellent results with almost any developer, though for instantaneous we prefer the combined ikonogen and hydrokinone, given in this column March 13.

G. R.—Provided both lenses are of the same focus, there is not a pin to choose between them; we have used both with excellent results. There are no better lenses in the market than the two you name.

MISS F. TAPP.—We shall use your kind contribution, for which many thanks.

W. H. HAYLES.—Your letter on Cambridge is published in our correspondence columns.

L. S. D.—The suggestion in your letter, if it were practicable for it to be carried out, would result in much greater difficulty in selecting a hand-camera than at present. Because one man can make his own camera, we fear it does not follow that everyone else could, even with the aid of an "illustrated descriptive article." Hand-cameras can now be purchased from ten shillings up to ten guineas, and beyond all, capable of doing excellent work, far better than any that are likely to be turned out at home, except under very exceptional circumstances.

ISIS.—The intensifier is to be bought, we believe, of Messrs. Horne, Thornthwaite, and Wood, Strand, or E. G. Wood, Cheapside. It is not poisonous. We could not accept the prints, as they would not conform to our conditions. We admit it is quite possible that "it is a pity that one cannot send in

jointly executed work after the style of novelists, dramatic authors, etc.," but we see no reason to alter our rules.

**DROP SHUTTER.**—Although, as we said, "Photography at Home" is a go-as-you-please competition it is manifest that photographs should come within the subjects as enumerated in the prospectus which, if you have not, we shall have pleasure in sending.

**J. L. LUDINGTON.**—The hand-camera you mean has many good points, and is cheap for the money, but we have not had an opportunity of subjecting it to a practical trial. You would find 5 by 4 a good size, as it admits of getting a good quarter-plate print from the negative without any loss of definition at the edges. We have written to you.

**ARTHUR B. CARRE.**—Thank you very much; we have registered your name and address, and may be glad to avail ourselves of your help.

**F. W. REYNOLDS.**—We have at different times subjected the lenses you name to practical tests, and found them to give good results. You will, we feel sure, be satisfied, should you decide to purchase.

**MISS C. E. YONGE.**—The query is inserted. If nothing comes of it we will insert query No. 2 next week.

**G. L. BARBER.**—The *Photographic Reporter* (Hazell, Watson, and Viney, Ltd., 1, Creed Lane, E.C.), monthly, 1s., contains a directory of photographic societies, with the Secretaries' names and addresses. This would probably help you. The North London Phot. Soc. Secretary, G. J. Clarke, 52, Queen's Road, Brownswood Park, N.; or the North Middlesex Phot. Soc. Secretary, J. McIntosh, 14, Lowman Road, Finsbury Park, London, N., would most likely suit. The Secretaries in both cases would give you all particulars.

**JOHN A. GORDON.**—The "closure" has been removed, and we shall gladly advise you or any of our subscribers in these columns upon any question appertaining to photography. The camera you first named is a thoroughly well made article, the inventor is the actual maker and a most intelligent workman. We think you will be quite satisfied with it. Of course, you should have no hand-camera of less than  $\frac{1}{4}$  plate size. If you decide to have a camera from the maker named, he will make you an article that will stand rough usage and will stand an African climate. Many thanks about the dark-room. We will send our form if you will kindly send us name and address.

**B. P. JACKSON.**—Many thanks. We shall use the matter shortly, and will make a block to illustrate the same.

**J. H. PICKARD.**—We will set up the article for *Reporter*. Strange to say, it had been determined to do as you suggest in your postscript, on the day we received your letter. In a few days you will receive a communication from our publishers.

**NEMO.**—The hand-camera you have bought is one which we have found to do excellent work, and cannot understand how it is you do not succeed. If you write more explicitly and tell us in what way you cannot succeed, we can doubtless help you.

**B. DILLON.**—The prints were sent off the day before your letter came to hand.

**H. HOLT.**—Very shortly.

**H. A. G. JEWITT.**—The old negative bath is hardly suitable for sensitising paper. Your best plan will be to dissolve some pure carbonate of soda in water, about 1 oz. in 4 oz., add this gradually to the old bath, shaking between each addition till no further precipitate is caused; collect the precipitate on a filter paper, wash well with distilled water. Mix 1 part of pure nitric acid with 3 parts of water, pour this little by little on to the precipitate in the filter paper till the whole of the carbonate of silver is dissolved. You have then a solution of nitrate of silver probably in a slight excess of acid. You now require to find out the strength of your solution, which can be done as follows: Dissolve 15 $\frac{1}{2}$  gr. of pure chloride of ammonium in 12 oz. of distilled water; measure out very accurately 1 dr. of the bath to be tested, and place in a stoppered bottle, rinse the measure out with a drachm of distilled water, and add to the bottle. Now add the chloride solution gradually, allowing 1 dr. for every possible 4 gr. of nitrate of silver. For instance, suppose we guess that there is 100 gr. to the ounce, the drachm will contain 12 $\frac{1}{2}$  gr., therefore we shall require about 3 dr. of chloride solution. We take as a precautionary measure 2 $\frac{1}{2}$  dr. of chloride solution and add to the silver solution in the bottle, and shake. When the chloride of silver has settled, we add 15 minims of chloride solution, and if a precipitate is still caused, we add a drop or two of a solution of bichromate of potash and shake. Deep red chromate of silver will be formed. We now keep on adding the chloride solution in 15 minim doses and shaking till the chromate of silver is all decomposed and the supernatant water is yellow in colour, which will not be the case till all the silver is precipitated as chloride. We then reckon how much chloride solution we have used, and find, say, 4 dr. 15 minims. We may then multiply this by 4,  $4\frac{1}{4} \times 4 = 17$  gr. per drachm.  $17 \times 8 = 136$  gr. per ounce. As we want our silver bath only 60 to the ounce, we have only to dilute with distilled water and make distinctly alkaline by adding a trace of carbonate of soda and the bath is ready for use. We shall be pleased to help you further if required.

**H. R. LEVINSON.**—The formula is:

Pyrogallol ... .. 1 oz.  
Sodium sulphite ... .. 4 "  
Sulphurous acid ... .. 1 dr.  
Distilled water ... .. 9 oz.

Dissolve the sulphite in the water, add the acid, and pour on the pyro.

**R. GORDON.**—We have no personal knowledge of the camera under the name you mention. The firm brought out a camera last year, which had a large sale and was capable of doing very excellent work. We have seen none of their this season's goods and are, therefore, unable to speak from personal knowledge of their merits. If you will tell us what money you are prepared to pay for a quarter-plate hand camera, we shall have no difficulty in recommending you a suitable and reliable instrument.

**NENNI.**—Yes, certainly you can eliminate the hypo now. Place the negatives in water and allow to soak for ten minutes, pour off the water, and replace by fresh; repeat this operation every ten minutes; in one hour the negatives would be thoroughly washed. Any good commercial washer, such as Wood's or Lancaster's, would help you considerably.

**A. G. PATERSON.**—The plates marked No. 19 are one-third more sensitive than those marked 18, and the former are superior in quality and price.

**DUBLIN.**—Although you give no name and address, we will answer your question by stating that we are not in the habit of criticising photo-mechanical prints which appear in the columns of contemporaries.

**J. H. J.**—The prints are far away, better than the average work of professional photographers and what little retouching has been done shows great care. We have not replied to you by letter, as although we must acknowledge to admiring your work, we do not give certificates of merit or testimonials to professional photographers. Why not send to a photographic exhibition? Your work will surely be noted, if not medalled. Specimens are returned. We should much like a copy of the girl with guitar.

**B. B. WAIN.**—We will try and get you some pulls. How many will you want?

**A. R. QUINTON.**—We cannot publish your letter, but should recommend you to address your complaint to the Photographic Dealers and Manufacturers' Association, 7, Southampton Row, W.C.

**TE WIRIMU.**—Certainly the picture would be eligible. Thanks for the correction; very pleased to be put straight upon such matters at all times.

**JAS. ANDREWS.**—Received with thanks, proof of article on "Composition" sent you this week.

**A. J. LEESON.**—Very shortly, when the prints will be returned.

**GRACE ROWE.**—We should be so much obliged if you would write us a short article upon the interesting places near Camborne.

**W. T. BARTON.**—There are few prints will stand twelve hours' washing without deterioration; six soakings in fresh waters during one hour are better than twelve hours' washing as you now work. Chloride of gold should always be neutralised. Binding cases can be had from our publishers.

**S. GLAZIER.**—If you are using your shutter at anything smaller than one-tenth of a second, use full aperture; also full aperture for inland work with shutter.

**A. JAMES.**—We write you by post.

**F. BENTZ.**—Letter by post.

**LENS.**—We think that you had better try Ross' new extra rapid symmetrical; though high in price, it is a very fine instrument. Taylor's is a first-class lens, and you would probably be able to get one on trial from the maker; or Wray's special detective would suit you.

**T. HALL.**—(1) Negative wants intensifying. (2) Not printed deep enough. (3) Practically untuned. (4) Ditto. You have got some impurities in your stock bath, and consequently the gold has precipitated. Add fresh gold, allow the bath to stand twenty-four hours, and then tone. The bath will give excellent purplish tones when properly made and used.

**LUX.**—The special number, we hope, will be out very shortly. Can you reduce every quantity to 4 oz.? Try the following:—

(I.)  
Eikonogen ... .. 80 gr.  
Sodium sulphite ... .. 160 "  
Water ... .. 4 oz.

(II.)  
Caustic potash ... .. 80 gr.  
Water ... .. 4 oz.

Mix in equal parts.

**COUNTRY COUSIN.**—We do not understand what you mean by "dirty;" are the glasses dull, or the mount, or what? Unscrew the glasses and wipe with a soft silk handkerchief. If you like to send us lens and pay carriage back, we will see to it for you.

**S. ARMSTRONG.**—(1) These lenses we believe to be of French make, and are not superior, in some cases inferior, to English lenses. (2) Wray's rapid rectilinear would satisfy all your requirements.

**T. H. BISHOP.**—Letter by post. You did not keep your negatives in developer long enough.

**ALPHA.**—Scratching on one corner of the film with

a sharp stylus is what we always use. You might obtain for a few shillings a diamond point, and write on the glass on the back of the plate in one corner.

**PYRO.**—Letter by post.

**W. T. TUCKER.**—Thanks for your note, but "there is nothing new under the sun." Your idea is merely utilising the action set up by the acid in the paper on the hypo to obtain sulphur toning, the earliest of all methods and by no means permanent results. Your prints are charming little studies, and might stand a chance in one of our competitions.

**W. DAVIES.**—(1) An inch off foreground would be an improvement, and the camerist should be wanting; you have a chance of making a picture out of this. (2) With cows, half an inch off foreground and deeper printing of clouds will improve. (3) Snow scene; print under-exposed, snow is white paper. (4) Snow again white paper, wrongly developed. (5) Under-exposed, snow too white; why didn't you make your figures snowball each other? (6) Good, we should have preferred the other way of plate. (7) The straight lines of fence spoil an otherwise excellent snowscape. (8) A little too flat and contains no leading object. (9) A capital evening effect; try again, as you suggest, with a boat and give a little longer exposure so as to obtain a little more detail in the right-hand corner. Your technical work is good, though your bromides are a little too hard; you ought to try your luck in our competitions, and certainly your work is above the average of some we have.

**MRS. J. F. RICHARDSON.**—Letter by post.

**G. H. M.—(1)** Very fair, light a little too low. (2) Good. (3) You were a great deal too far off to make anything of this view, otherwise it is pretty fair. The foreground contains nothing of any interest.

**ART STUDENT.**—You should get a quarter-plate portrait lens, which would just suit your purpose, being quick enough for children. Just the lens for enlarging when stopped down slightly.

## Monthly Competition.

### XXV.—VILLAGE LIFE, FARMING, ETC.

Title of Photograph.	By whom sent.

Supper Time ... ..	H. Selby

## Quarterly Examinations in Photography.

### QUESTIONS.

- Forward a lantern slide produced by reduction from the negative in your possession (Question 16), using a chloride plate or chloro-bromide, so as to obtain a red image.
- What are the advantages and disadvantages of dry collodion plates, as compared with gelatine dry plates? Give an outline of the dry collodion process.
- Give a brief resumé of the leading iron printing process.

(Latest Day for Answers—June 15th.)

### RULES.

- Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT,"  
AMATEUR PHOTOGRAPHER,  
1, CREED LANE,  
LONDON, E.C.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. **Halfpenny stamps preferred.** A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.**

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

**Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.**

## THE MOST PERFECT HAND CAMERAS

## THE KINEMATIC

PATENT APPLIED FOR.

Has one simple movement only, and not two or three complicated ones; size 9 x 9 x 3½; weight only 4½ lbs., with 12 quarter plates; fitted with rapid achromatic lens and view finder, a shutter ever set for instantaneous or time; and neatly finished in leather.

The "KINEMATIC" is fitted with a patent central opening and closing automatic self-registering exposure shutter which cannot possibly be accidentally opened or shut by vibration or any other cause. This shutter is unique, and is the only one that registers the number of exposures taken, and can be used for either instantaneous or time exposures.

Price £3 3s.

Fuller details, if required, from

S. T. MATTHEWS & CO., 8a, John Bright Street, BIRMINGHAM.

## THE ITAKIT

PATENT APPLIED FOR.

Carries 24 3¼ x 3¼ plates; weighs only 3½ lbs., with plates; fitted with rapid achromatic lens and shutter for instantaneous or time exposure; a marvel of cheapness.

Price 12/6.

Ditto, with view finder and focussing screen, full size of plate, 20/-

Cases for ditto, if desired, 8/6 extra.

Extra magazines for either, 3/6 each. These contain carriers for holding an additional 24 plates.

Specimen Photographs of Itakit, 3 stamps.

The Dates given below are those upon which the Competitors' work must actually be received.

JUNE	17	...	Public Schools	...	...	...	...	...	Entry form on application.
"	30	...	* Photography at Home	...	...	...	...	...	Entry form on application.
JULY	1	...	Monthly Photographic	...	...	...	...	...	OUT-OF-DOOR FIGURE SUBJECTS, GROUPS, ETC.

All prizes will be in the form of Medals from the "AMATEUR PHOTOGRAPHER'S" several dies. No prize winner will be allowed to compete again for a Medal of the same value as that awarded him. The "AMATEUR PHOTOGRAPHER" Monthly Competitions are for the encouragement of beginners and those who have never entered a competition or exhibited their work. In the competitions marked with an asterisk, special or "progressive" Medals will be offered for competition by past prize winners.

Further Particulars, Entry Forms, etc., will be sent on receipt of stamped envelope.

Address: THE EDITOR, "AMATEUR PHOTOGRAPHER,"  
1, CREED LANE, LONDON, E.C.

NOTE.—ALL APPLICATIONS TO BE ENDORSED, "COMPETITIONS."

## BOOKS PUBLISHED AT THE OFFICE OF THE "AMATEUR PHOTOGRAPHER."

**DICTIONARY OF PHOTOGRAPHY.** By E. J. WALL. New and revised edition, 2s. 6d.  
It contains more information on Photography than any book published.

**BOOK OF THE LANTERN.** By T. C. HEPWORTH, F.C.S. Third edition, 3s. 6d.  
The only book published that gives complete instructions as to how to make lantern slides, purchase and work the optical lantern.

**ART PHOTOGRAPHY.** By H. P. ROBINSON. 1s.; cloth, 1s. 3d.  
In this book Mr. Robinson deals with Art in a manner which the student can understand and appreciate. No amateur should be without it.

**ART OF RETOUCHING.** By J. HUBERT. 1s.; cloth, 1s. 3d.  
The cheapest manual on "Re-touching," written by one who knows, for those who wish to learn.

**PLATINUM TONING.** By LYONEL CLARK. 1s.; cloth, 1s. 3d.  
This book has revolutionised printing processes. The instructions given by Mr. Clark permit of obtaining the most delightful range of tones. Every one should buy a copy, and learn how to do it.

**EVENING WORK.** By T. C. HEPWORTH, F.C.S. Just Published, cloth, 2s. 6d.  
This is a most delightful book, from which any number of good things may be learnt. The Chapters on the application of the ELECTRIC LIGHT to photography are most interesting and instructive.

**PICTURE MAKING BY PHOTOGRAPHY.** By H. P. ROBINSON. Cloth, 2s. 6d.  
Is a book for the art student to study carefully. The examples given will help him materially to make pictures.

**EXPERIMENTAL PHOTOGRAPHY.** By CLEMENT LEAPER, F.C.S. 1s.; cloth, 1s. 3d.  
This book is a guide for the beginner, and traces the whole course of work for any one taking up photography. It should be the constant companion of the Amateur Photographer.

**CAMERAS, LENSES, AND SHUTTERS.** By Sundry Writers. 1s.; cloth, 1s. 3d.  
This book contains many valuable articles upon apparatus, contributed to the *Amateur Photographer* competitive papers, and which were awarded prizes.

**DEVELOPMENT.** By LYONEL CLARK. 1s.; cloth, 1s. 3d.  
A very handy book on developing, which should be read by all; it also contains an article upon the use of Eikonogen. Mr. Clark's successful photographic work should induce many to acquire a knowledge of how it's done.

**A TOURIST'S EQUIPMENT.** By Rev. PRECENTOR MANN, M.A. 6d.  
A very useful little pamphlet, giving the most complete instructions as to what kit to take, how to use it, and other useful "tips" for the touring photographer.

**PRIZE PICTURES: THREE WEEKS IN NORWAY.** By PAUL LANGE. 2s. 6d.; cloth, 3s. 6d.  
This book contains several most beautiful views of Norwegian scenery from negatives by the author, also a brightly written account of the trip. The illustrations are allowed to be some of the finest ever produced.

NOTE.—Any Photographic Publication can be supplied by Messrs. HAZELL, WATSON, & VINEY, LD., and a full list of books upon Photography will be sent upon application

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, E.C.

London: Hazell, Watson, and Viney, LD., 1, Creed Lane, E.C.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.*

OUR VIEWS.—Mr. Alf. Maskell and Mr. Burchett's replies to Mr. Pennell at the Camera Club; The Library at the Camera Club; more members wanted—AMATEUR PHOTOGRAPHER Competition No. 25, "Village Life, Farming," etc.—Mr. Bhedwar's Portraits of H. R. H. the Duke of Edinburgh—The Birkenhead Society—A Society for Great Grimsby—Exhibition at Amsterdam—The Fire at Mr. Lafayette's Establishment in Dublin—The Fourth Annual Exhibition at New York—A Society at Frome, President the Rev. H. B. Hare—The Convention to be invited to Edinburgh next year—The Convention Arrangements at Bath—*The Lady* on "Photography as a Recreation for Ladies"—"Notes on Perspective Drawing and Vision," by Dr. P. H. Emerson and T. F. Goodall.

LEADER.—Home Portraiture.

COMMUNICATED ARTICLES.—The Construction and Use of Photographic Lenses (Leaper)—Instantaneous Photography (Harrison).

NOTES.—Our Contemporaries—Edinburgh Centre—Thursday Evenings at the Camera Club.

REVIEWS.—"Photography Annual"—"Elementary Systematic Chemistry."

EXHIBITIONS.—Egypt in London—Photographs at Sutton.

DARK-ROOMS.

SOCIETIES' MEETINGS.—Ashton-under-Lyne—Cardiff—Croydon Micro—Holborn—Lewisham—Lowestoft—North London—North Middlesex—Putney—Richmond—Rotherham—Sheffield—Southport (Social)—Wolverhampton.

APPARATUS.—Shenstone's Focussing Cloth Clip—Automatic Sucker Handle.

QUARTERLY EXAMINATIONS.

HOLIDAY RESORTS AND PHOTOGRAPHIC HAUNTS.—Stirling (Scotland).

and all those who saw the crowded state of the large room and withal the quite-at-home look of all present on Thursday, must be proud of the Club and its work. How much more must those feel who have worked early and late to build up the Club and secure for it a home which is unsurpassed either on the Continent or in America. The library, which has been built up through the energies of Mr. Lyonel Clark, is a most valuable section of the Club. Mr. Clark has got together many hundreds of volumes, many of them most valuable, for which he is indebted to individual members of the Club; still, the work of forming such a library has been a big task, one which Mr. Clark has brought to a successful issue, and it will remain for all time a testimony and monument of his untiring zeal for the well-being of the Camera Club.

There are probably still many of our readers who might, with advantage to themselves and benefit to the Club, become members. For their information we would say that the Committee are still prepared to receive a few more members at the reduced rate of subscriptions, viz., town members, £4 4s.; country, £2 2s.; and foreign members, £1 1s. In addition to the Club being the largest photographic club in the world, it has the distinct advantage of being a social club of the very first class—an additional inducement, no doubt, to many men interested in photography but who possibly are not members of other clubs. Mr. George Davison, the courteous Hon. Secretary, will gladly forward proposal forms and list of members to those who may write him at the Club-house, Charing Cross Road, London, W.C.

We are much disappointed with the photographs contributed to the AMATEUR PHOTOGRAPHER competition, No. 25, "Village Life, Farming, etc." There is really no picture up to first-prize standard; we shall therefore award no silver medal this month.

*Second Prize (Bronze Medal).*

MR. C. A. IRVINE .. .. Twickenham.

This competitor sends us "Life's Evening," a well-selected picture—an old lady sitting at her cottage door; the rendering of the subject is extremely simple, and that is the charm of the picture. Other photographs calling for note are "A Welcome Rest," Mr. A. James (Barry); "Sheep Washing on Skomer Island," Miss Claire Vaughan Davis (Skomer); "A Village Smith," Mr. Martin S. Davis (Fleetwood); "Practising for the Harvest Home," Mr. G.

MUCH interest was evinced by members and those who were invited to attend the "Thursday Evening" at the Camera Club last week, when Mr. Alfred Maskell and Mr. Arthur Burchett read carefully prepared papers answering Mr. Pennell's paper, read at the Camera Club Conference, on "Photography as a Hindrance and a Help to Art." The matter is dealt with in another column, and we only draw attention to the subject here to note how strongly the readers of the papers and the several speakers who took part in the discussion persisted that photography had established a claim to be considered a "help to art." Mr. Pennell's reply was long and tiresome. He did not strengthen his claim that "photography was a hindrance to art," and his utter want of knowledge of even elementary principles of photography provoked much laughter. Argument he had none, and resorted to the time-honoured or dishonoured practice of "abuse the plaintiff." It is, we think, to be regretted that the Camera Club should have given Mr. Pennell another opportunity of letting the world know how little he knew either whether "photography was a help or a hindrance to art."

THE Camera Club in its new home is an immense success,

A. Carruthers (Liscard); "Ploughing, Pau," by Mrs. Annesley (Pau); and "The Sage, the Swain, and the Sweetheart," Rev. R. C. Macleod.

All the pictures sent in will be commented upon in the *Photographic Reporter*.

Mr. SHAPOOR N. BHEDWAR has kindly given us an opportunity of inspecting the portraits of H.R.H. the Duke of Edinburgh, who, as we noted last week, honoured him with a sitting. We have seen three of a series of six taken, and can only say they are admirable, both as portraits and examples of photographic technique. They have not been retouched, and were all taken during a very short sitting. The Duke has expressed himself most delighted with the portraits, and it is more than likely that Mr. Bhedwar will receive a command to photograph the Queen. This will be indeed greatly appreciated by Mr. Bhedwar, who, as most of our readers know, is a Parsee, and who in this country has for the last two years practised as an amateur, but now he is returning to Bombay to commence business. The mere fact of one of the Royal Dukes having sat to him will help to secure him patronage, but to have photographed the Empress of India will indeed prove to his brothers in the East how highly his talent for photography has been appreciated in this country. Mr. Bhedwar has won the hearts of many whilst in England, due to his modest, simple, and withal courtly bearing. We can only hope that the honours, medals, and distinctions which he has gained will enable him to elevate photography as an art in Bombay. Of this we are sure, he will never rest satisfied to turn out from his *atelier* any but the very best work.

THE programme of arrangements on Thursday evening for the members of the Birkenhead Photographic Association included a paper by the President, Mr. G. E. Thompson, entitled "Experientia Docet," which was to be followed by a lecture by Mr. Charles Sharp on "Authors and Artists at Play." This association has a very extensive membership, and much good work is done by them.

EVERY week new societies. Last week we told of a photographic society being started at Macclesfield; this week a letter reaches us from Great Grimsby, from which we gather that the amateur photographers are to have a club at last. They have for some time been contemplating the formation of a club or society, but now it seems that the Grimsby Cyclists' Club intend to establish a photographic section. This club numbers more than 300 members, and have a club-house in which a commodious dark-room is being fitted up, and every effort will be made to have a first-class photographic section. We shall be able to give more particulars at an early date.

THE exhibition at Amsterdam, to which we have already called attention, will be held in September. It will be divided into three sections—professionals, amateurs, and apparatus. In each of the former sections there will be six classes, and in the latter two classes only. All photographs must reach Amsterdam on or before the 1st of September. In the professional classes medals and diplomas will be given, but in the classes restricted to the work of amateur photographers, medals only will be given. Full particulars may be obtained of Mr. C. J. Schuwer, 72, Hoofstraat, Amsterdam.

WE learn from a correspondent that the recent fire at Mr. Lafayette's establishment in Dublin was not at all so destruc-

tive to property—although two firemen, unfortunately, lost their lives—as was at first believed. The valuable stock of negatives of Royalty and others, was uninjured, being stored at the printing works a little way out of town.

A CORRESPONDENT has kindly sent us a few lines upon the Fourth Annual Exhibition held in New York, under the auspices of the Society of Amateur Photographers of that city, which was opened on the 24th of May. He says—

"The Exhibition is way ahead of anything ever shown in New York before, the great success being due chiefly to the untiring energy of the Secretary, Mr. Beach.

"The English exhibitors are: Mr. and Mrs. Anckorn, John E. Austin, George Bethune, F. P. Cembrano, Mr. S. F. Clarke, Mrs. S. F. Clarke, C. Court-Cole, Adam Diston, A. R. Dresser, Jos. Elliot, J. P. Gibson, Martin J. Harding, J. H. Harvey, Hedges and Sons, R. Keene, Nelson King, Edgar G. Lee, Louis Meldon, Thos. Mansell, D. Pym, H. P. Robinson, L. Sawyer, F. M. Sutcliffe, H. Symmonds, Tagliaferro, Harry Tolley, Werner and Son, Wilson and Sons, etc.

"The awards are—For Photographs: F. Sutcliffe, Gibson, Robinson, Court-Cole, Diston, Keene, Cembrano, Harding, Redfield (Philadelphia), A. Clements (Philadelphia), Jackson (Denver), Alfred Steiglitz (New York), C. Berg (New York), James Breese (New York), E. Lincoln (Massachusetts), Tarbell (New York), G. Nelson (Lowell). For Slides: Dr. Mitchell (Philadelphia), Miss Barnes (New York), and Wilson and Sons (England)."

THE veteran amateur photographer, the Rev. H. B. Hare, writes us that a photographic society has been formed at Frome. We are pleased to note from a local paper that Mr. Hare has been unanimously elected the first President of the society, which has already a considerable number of members. Dr. A. W. Dalby has consented to act as Hon. Secretary; the society is open to both ladies and gentlemen, professional photographers are admitted at a reduced rate of subscription. The society will have one great advantage in the help and aid of their enthusiastic President, a gentleman who has practised photography for many years, and under whose guidance we feel sure the society will be a marked success.

EVERY one will be delighted to hear that the Edinburgh Photographic Society are going to invite the Photographic Convention of the United Kingdom to visit Auld Reekie next year.

THE Exhibition Sub-Committee of the Convention are very anxious to get together a thoroughly representative exhibition of apparatus, etc., at Bath. They ask for such articles as hand-cameras; apparatus for taking photographs in rapid succession; photo-micrographic apparatus; balloon and military photography; flashlight apparatus; apparatus designed for special work, as medical, underground, etc.; optical lanterns and fittings; photometrical apparatus and the like; apparatus for, and specimens of, astronomical and meteorological photography. The committee is small, though a strong one—Messrs. G. Davison, Friese Greene, Andrew Pringle, and Henry Sturmeay. Their appeal will not, we are sure, be in vain, and we do hope that there will be a first-class show of photographic impedimenta and specimens of work done. No attempt is made to have a show of pictures, we believe. All exhibits must reach the Guildhall, Bath, not later than the 4th of July, addressed to the Convention.

WHEN a society paper begins to write on matters photographic, we expect some curious statements; but when a paper publishes a series of articles on this subject, one supposes them to have been written by someone not absolutely ignorant of the first principles. In last week's issue of *The Lady*, we note the conclusion of an article on "Photography as a Recreation for Ladies," by "Sol," which tells the readers

how to print. The author states that hyposulphate of soda is one of the necessary articles, and then goes on to inform us that "we next open the back and place the negative with the prepared surface uppermost at the bottom of the frame. A piece of sensitised paper, cut to the size, should then be laid flat on the glass, remembering *that the sensitised surface is in contact with the glass.*" We were always under the impression that the sensitive surface should be in contact with the film. Probably, however, ladies do not work this way. The formula for the borax bath is given as follows:—

Borax pulv.	..	..	..	..	1 oz.
Water (boiling)	..	..	..	..	20 "
Gold	..	..	..	..	2 dr.

and the unfortunate tyro is told to let it get quite cold before use. Probably the author has discovered that gold is soluble in an aqueous solution of borax. We were under the impression that *aqua regia* was the best solvent. The last straw, however, is the formula for the fixing bath, which is as follows:—

"Hyposulphate of soda	..	..	..	5 oz.
Liquor ammonia	..	..	..	2 dr.
Water	..	..	..	3 oz.

When the soda has quite dissolved, pour this solution into another dish." Poor, unfortunate tyro! Five ounces of hypo, and only 3 oz. of water to dissolve it in! We can do a good deal, but even this is beyond us, and the poor print, in what condition would it be after fifteen minutes' immersion? The author concludes by saying, "To excel in photography is only achieved by constant practice, and, as I have already said, dogged perseverance." Quite so!

At the moment of going to press we have received a pamphlet, the joint work of Dr. P. H. Emerson and T. F. Goodall, "Notes on Perspective Drawing and Vision."\* At the present time the subject is one of peculiar interest, and many will doubtless wish to make themselves acquainted with the opinions set forth. We have not space this week to publish the text which Dr. Emerson has courteously placed at our disposal, but we cannot help quoting the concluding paragraph:—

"*Final.*—Having shown how we see forms, it only remains to say that a mathematical perspective drawing, or the drawing of an aplastic photographic lens, does not give forms as we see them. They are altogether false to the visual impression of the proportion of things, and therefore give a wrong idea of the original scene. On the other hand, a perspective drawing, or correct photograph, gives the *actual facts* scientifically, *i.e.*, the pillars of the temple as leaning, the paper in experiment as *square*. All such drawings are, therefore, purely scientific diagrams, and artists, who wish to render what they see, must not rely upon them."

From this it will be seen that Mr. Pennell has a champion, and the question of perspective and photography finds yet one more exponent.

### HOME PORTRAITURE.

We have now reached the last stage of our hints on photography at home, and include a few hints on the faking of negatives and choice of printing processes. A rough proof should be taken from the negative as soon as perfectly dry, and the proof toned and fixed; we are now in a position to find faults and defects. If the shadow side of the face is too dark it will be found advisable to coat the back of the negative with pale yellow matt varnish, or even to work on the film side with a little retouching medium and powdered graphite, manipulating with a stump.

Pinholes may be easily stopped out and, if necessary, a little black speck on the film, which gives a white spot on the print, can be easily eradicated by carefully manipulating a needle inserted in a penholder. Of actual retouching, we do not intend to speak, further than to strongly recommend any one desirous of entering this by no means difficult branch of practical work to study No. 5 of the "AMATEUR PHOTOGRAPHER Handbooks," and then practice what is there taught. It has been said that a successful retoucher must be an artist and an anatomist. Possibly this is true, but anyone with a little practice can learn sufficient retouching to be able to soften down glaring freckles and other defects, natural or appertaining to the process.

Negatives should be varnished before proceeding to actual printing, and although this is too frequently a bugbear to the amateur, it is, like everything else, merely a question of practice. We hope during the next few weeks to be able to give some practical hints on varnishing, so must defer any longer notice for the present.

The choice of printing process is always a difficult one. Many sitters who are ignorant of photography prefer the ordinary albumen print, merely because they have never seen any other process. For small work such as cartes-de-visite, gelatino-chloride paper, Obernetter or Celerotype, white, will give good results, but for larger work, such as cabinets, whole-plates, etc., a matt-surface paper is far superior. To this category belong matt-surface Obernetter or Celerotype, rough bromide paper, printing-out platinotype, the ordinary platinotype, and kallitype. In choosing a process we must look at the character of the negative. Thus for a flat, thin negative a gelatino-chloride paper should be used, as this tends to increase of contrast; for a plucky negative with decided contrasts this paper should be avoided, and a rapid bromide paper, platinotype, or kallitype used. Vignetting is by no means difficult, and, in some cases, of advantage for cutting off unnecessary details in the backgrounds, etc., but it should be well done to be effective. Then again, the character of the vignette should be chosen in accordance with the style and character of the picture. Thus, a sitter in a white dress against a dark background should be vignettied, not with the margins white, which would detract from the high lights of the picture, but the edges should shade off darker, which is obviously done by shading the centre from the action of light and allowing the edges to blacken and bronze in the sun. A sitter in a dark dress against a light background may be vignettied in the usual way.

There are in the market some shapes, such as pots, fans, artists' palettes, etc., which are recommended for portraits. Our advice with regard to these is to have nothing to do with them; they certainly are not artistic, and the results are in some cases positively ludicrous.

For large work, such as whole-plate or enlargements from small negatives, we strongly recommend bromide paper, and have obtained exquisite results on Fry naturalistic bromide paper, whilst for a smoother surface, carbon gives some very fine results, and affords a good range of colours from the Bartolozzi red to black.

We have thus briefly run through our series of hints on Home Portraiture, and we must leave our readers to modify them by experience and practice. We have tried to point out certain pitfalls and faults into which we are all liable to fall, and we trust to see an improvement in technique in the prints sent in to our competition, "Photography at Home," which closes on the 30th of this month, and we should strongly recommend any and all of our readers to enter for this competition, as prints sent in will be criticised and suggestions for improvement made.

\* London: Warren Hall and Lovitt. Price 6d. (Messrs. Hazell, Watson, and Viney, Ltd., will forward copies on receipt of stamps.)

## The Construction and Use of Photographic Lenses.

BY CLEMENT J. LEAPER, F.C.S.,

*Instructor in Photography, City of Dublin Technical Schools.*

### CHAPTER V.—(Continued.)

#### ON TESTING PHOTOGRAPHIC LENSES.

##### (1) Focal Length, and Position of Nodal Points.

HERETOFORE we have assumed that all rays passing through a lens cross at the optical centre, but it must be evident that this can be true only when the lens is exceedingly thin. With photographic lenses as commonly made, there exist two fixed points, situated on the principal axis, and called nodal points of admission and emission, such that the rays coming from the object cross at the nodal point of admission, and having reached the nodal point of emission, again cross and emerge to form the image.

In fact, in the formula  $F = \frac{1}{f} + \frac{1}{f'}$ , so useful for many purposes, all distances are to be reckoned from these nodal points and not from the optical centre of the lens or from either of its surfaces.

It might at first sight seem from this that a non-symmetrical lens possessed two principal foci, but as a matter of fact the distance between the point at which parallel rays meet, and the nodal point of emission, using the lens in its usual position, is identical with the corresponding distance when the lens is reversed.

Since all rays forming the image of an object pass through the nodal point of emission, it follows that if a lens is rotated over this point as an axis, the image yielded by it cannot suffer displacement, and this fact affords a direct means of ascertaining the position of the node of emission when the lens is used in its ordinary position, and of that of admission when the lens is reversed. The position of the nodes with reference to any convenient fixed point on the lens having been thus ascertained, the distance between that point and the principal focus can be easily found, and the sum of these distances gives at once the focal length.

To carry out the process, a fine human hair is stretched over the back flange of the lens so as to lie across its diameter, and secured in position with a rubber band slipped over the flange.

The lens is then placed on its support on the optical bench, carefully centered with respect to the magnifier, and pointed towards some prominent object situated at a considerable and known distance from it, this object being then accurately focussed. If now the lens board is rotated through an angle of about 10 deg., and back again, the image will be displaced if the axis of rotation does not coincide with the nodal point of emission. Presuming that the image is displaced, the lens support is moved backwards and forwards until the image remains stationary, when the lens is rotated. When this occurs, the axis of rotation is over the node, and the distance from back flange to axis of rotation gives the position of the nodal point.

The position of the magnifier board on the scale having been read off, it is pushed forward until the hair stretched over the flange is in focus, when the difference between these two distances gives the distance of the principal focus from the hair or flange, and this distance taken from or added to as the case may be, the distance from the flange to the nodal point of emission gives the principal focus of the lens.

As a check, the lens is reversed, and the entire series of

operations repeated, when a result identical with the former one should be obtained.

It is useful after determining the focal length to find the angle of the field of visibility. This is readily done by tilting the lens until the image completely disappears, when twice the angle through which it has been moved gives the required measurement.

The following results obtained with a single landscape lens and a portrait lens of the Petzval type are appended as examples, both lenses being constructed to cover quarter-plate size:—

##### *Single Lens (Direct Position).*

Distance of nodal point of emission behind* back flange	16 inch.
Position of magnifier on scale with distant object in focus	29.84 inches.
Position of magnifier on scale with hair (or flange) in focus	24.32
Distance of principal focus from hair or flange	5.52 inches.
Distance of principal focus from nodal point of emission	5.52 - 16 = 5.36 ins.

##### *Single Lens (Reverse Position).*

Distance of nodal point of admission in front of back flange	16 inch.
Position of magnifier on scale with distant object in focus	29.52 inches.
Position of magnifier on scale with hair (or flange) in focus	24.30
Distance of principal focus from hair or flange	5.22 inches
Distance of principal focus from nodal point of admission	5.22 + 16 = 5.38 ins

It is evident, therefore, that the two nodes coincide, and that the P. F. is 5.37 inches if the object is at infinity. A correction must, however, be made for the distance of the object. This being 4,000 inches, we get  $\frac{5.37^2}{4,000} = .007$ , or, say, .01 inch, so that the true focal length is 5.36 inches.

##### *Portrait Lens (Direct Position).*

Distance of node of emission in front of back flange	2.08 inches.
Position of magnifier on scale with distance object in focus	26.64 inches.
Position of magnifier on scale with hair (or back flange) in focus	21.92
Distance of P. F. from hair or flange	4.72 inches.
Distance of P. F. from nodal point of emission	4.72 + 2.08 = 6.8 ins.

##### *Portrait Lens (Reverse Position).*

Distance of node of admission in front of front flange	1.76 inches.
Position of magnifier on scale with distance object in focus	27.36 inches.
Position of magnifier on scale with hair (or front flange) in focus	22.44
Distance of P. F. from hair or front flange	4.92 inches.
Distance of P. F. from nodal point of admission	4.92 + 1.76 = 6.68 ins.

Mean focal length, 6.74 inches, which less correction equals 6.73 inches. Since the measured distance between the two flanges, viz., 3.48 inches, is less than the sum of the distance of the two nodes from each flange, viz., 3.84,

\* The word "behind" refers to the *object*, i.e., the nodal point of emission is further behind the object than the back flange.

it is evident that these are crossed *i.e.*, that the node of admission is behind that of emission.

(2) *Extent, Depth, and Illumination of Field of Definition.*

Theoretically, it is impossible to obtain simultaneously an absolutely sharp image of objects situated at different distances from the front nodal point, but, practically, we content ourselves with calling an image sharp if the circles of confusion do not exceed a certain maximum. In other words, the lens may be moved to and fro or tilted through a certain angle without impairing the sharpness of the images formed by it. The angle through which the lens can be so tilted measures the angle of the field of definition, and the extent to which it can be moved to and fro measures its depth.

To measure the angle and depth of the field a small cap slides over the magnifier, open at one end, and carrying at the other a very thin glass plate, ruled with a diamond with two lines, one-fourth of an inch apart, at each side of which are two others  $\frac{1}{100}$  inch apart. This is moved to and fro until the lines are seen distinctly in the magnifier. Then, taking  $\frac{1}{100}$  inch as the limit of our circle of confusion, it is clear that an object is in focus which at twelve inches from the ruled lines fills, in the magnifier, either the pair of lines  $\frac{1}{100}$  inch, or those  $\frac{105}{400}$  (*i.e.*,  $\frac{1}{4} + \frac{1}{100}$ ) inch apart.

To measure the angle and depth of the field, the board shown in fig. 29 is placed on the bench and the lens arranged on its support, so that its node of emission is exactly over the axis of rotation, and twelve inches from the ruled glass in the

FIG. 29.

magnifier placed in the second support shown. The support carrying the movable slit is now moved backwards and (the axis of the two boards coinciding) forwards until the image of the slit is seen in sharp focus in the magnifier, and this done, the distance between the jaws of the slit is altered until the rectangle of light just fills the space between the lines  $\frac{1}{100}$  inch apart. The lens is then gradually rotated through angles of 5 degs. at a time, and the position of the image sought by moving the magnifier in the opposite direction. This is repeated until the image just fills the larger distance, *i.e.*,  $\frac{105}{400}$  inch between the ruled lines, when evidently twice the angle through which the lens has been tilted gives the angle of the field of definition, and the distance of the magnifier from its starting point gives the diagonal of the plate which the lens will cover with sharpness with the stop that is being used.

To measure the depth of the field, the lens and magnifier are brought back to their original positions, and the magnifier board is then moved backwards and forwards until the image filling a quarter of an inch in one position fills  $\frac{105}{400}$  inch in the other positions. Then evidently the entire distance through which the lens has been moved (*i.e.*, from its furthest to its nearest position) gives the depth of the field.

We may, in fact, look upon this field of definition as a

spherical shell subtending a certain angle, having a certain depth, and of a volume measured by

$$\frac{4}{3} \pi (r_1^3 - r_2^3) \sin^2 \frac{1}{4} A,$$

in which  $\pi = 3.1416$ ,  $r_1$  and  $r_2$ , the extreme limits through which the magnifier has been moved, and  $A$  the angle of the field. Since, however, both the angle and depth of definition vary with the stop and the focus, the volume of the field does not give us a comparative measure of the values of two lenses unless we take into account the actual illumination of the field.

Knowing, however, the focal length of the lens and the diameter of the stop employed when measuring the volume of the field, we get the illumination by squaring the ratio of focus to aperture expressed in the usual way, at all events if the lens is free from scratches, etc.

If the lens is a single one, the measured diameter of the stop gives its available aperture; if the lens is of the doublet form, the available aperture  $A$  is given by the equation

$A = \frac{p a}{p - d}$ , in which  $p$  equals the principal focus of the front lens of the combination,  $a$  the actual diameter of the aperture, and  $d$  the distance between stop and nodal point of emission of front lens.

Having obtained the volume of the field and its illumination, the product of these two quantities gives what we may call the photographic value of the field.

(3) *Spherical Aberration.*

To determine the presence of this and its amount, the lens is mounted as previously described and focussed with full aperture on fine cross wires placed at about ten times its focal distance. The smallest stop is then inserted, which, if spherical aberration is absent, will cause no alteration in sharpness.

If, however, spherical aberration is present, it will be found that the cross wires in good focus with full aperture will now be out of focus, and to restore the sharpness the magnifier will have to be moved further back. Calling the first position of the magnifier  $d_1$  and its second position  $d_2$ , and the focal length of the lens  $F$ , the amount of longitudinal spherical aberration,  $S$ , is given by the equation

$$S = \frac{F [(d - F) - (d_1 - F)]}{(d - F) d_1 - F}$$

To be comparative, the test must be made upon lenses stopped down to the same extent, say from  $f/10$  to  $f/40$ , and invariably placed at a definite multiple of their focal length from the cross wires. If the lens is a simple one, the diameters of the stops would be one-tenth and one-fortieth of the focal length; but if the lens is a doublet, the diameter of the larger stop is given by  $\frac{p-d}{10p}$ , and that of the smaller by  $\frac{p-d}{40p}$ , in which  $p$  equals focal length of front combination, and  $d$  distance between stop and nodal point of emission of front lens.

(4) *Distortion and Chromatic Aberration.*

To prove the presence of distortion, mount the lens on the optical bench, so that the axis of rotation coincides with its nodal point of emission, and laterally displace it through an arc of 10 degs. whilst examining in the magnifier the image of two parallel lines about six inches apart placed in front of the lens at a distance equal to ten times its focal length. If the two images are seen to diverge at the top, pin-cushion-shaped distortion is present; if they converge at the top, the lens gives barrel-shaped distortion.

To test for chromatic aberration, the lens is arranged in

front of a slit,  $2 \times .04$  inches, made in a piece of blackened tin plate, and provided with two very fine cross wires. The slit itself facing the clear sky, the image of the cross wires is focussed in the usual way, and this done the magnifier is replaced by a small direct vision spectroscope so arranged that the image formed at the focus of the magnifier is also at the focus of the spectroscope. If the lens is not achromatic, only one portion of the spectrum will be in focus; if it is achromatic, two portions, viz., the blue and the violet, will be seen distinctly at one and the same time.

## Instantaneous Photography.

By W. JEROME HARRISON, F.G.S.

### CHAPTER XVI.—Continued.

#### BEST FOCAL LENGTHS OF LENSES FOR INSTANTANEOUS WORK.

EXPERIENCE teaches us that the lens which is most serviceable for instantaneous work should have a focal length not less than the longer side of the plate employed, nor greater than one and a half times that side. Thus, for a quarter-plate, the best focus lens lies between  $4\frac{1}{2}$  inches and  $6\frac{5}{8}$  inches. Almost exactly half-way between these measures lies the lens of  $5\frac{1}{2}$  inches focal length; and that is the lens which we prefer to use upon a quarter plate.

Table of focal lengths of lenses recommended for instantaneous work upon plates of different sizes:

Quarter plate	.....	= $5\frac{1}{2}$ inches.
5 by 4	"	$6\frac{1}{4}$ "
Half	"	8 "
Whole	"	11 "
10 by 8	"	$12\frac{1}{2}$ "
12 by 10	"	15 "
15 by 12	"	19 "
24 by 20	"	30 "

But in each case—and especially for the smallest size—we must confess to a liking for a lens which will cover a size larger than the plate which is employed. We are in the habit of using a lens of  $5\frac{1}{2}$  inches focus (a lens which covers a plate 5 by 4 inches) upon a quarter-plate, and this gives us complete satisfaction.

**Fixed Focus Lenses.**—There is no such thing as a "fixed focus" lens. Several makers of hand cameras advertise them as fitted with a "fixed focus lens," by which they mean (or their customers understand) a lens which is in focus for all objects, no matter what their distance from the camera, or at least in focus for objects which are not nearer the camera than a certain specified distance, usually about 12 or 15 feet.

But the mathematician and the optician tell us—and our common sense agrees with them—that a "fixed focus" lens is an impossibility. Every point in an object which is "in focus" is reproduced by a point in the image.

Let us set up a number of large printed letters—say the twenty-six letters of the alphabet—one behind the other, and at a distance of (say) three inches apart. Let each letter be raised a little above the one in front of it, so that all can be seen at the same time upon the focussing glass. With open aperture (*i.e.* the largest stop which the lens permits of) carefully focus the middle letter (say M), and expose a plate. We will suppose the lens to be one of the highest quality, and that the distance of the camera—a quarter-plate—is about twelve feet from the letter focussed.

When the plate is developed and carefully examined through a magnifying glass, the letter focussed upon (M), and that letter only, will be strictly sharp and well defined.

Both L (nearer the camera) and N (farther away) will be slightly blurred; and the outlines of the other letters will be more and more diffused and hazy as their distance from M increases.

It is only possible to have one plane of the picture in perfect focus. In the case just described, there are twenty-six planes, separated from one another by the distance of three inches. Now, twenty-five of these planes *must* be more or less "out of focus."

But perhaps the reader will say, "Oh, but by inserting a small stop I can get *several* of the letters—say two or three on each side of M—in focus." We will admit that they may be obtained in *better* focus—more clearly defined than when the largest stop was used—but to have them in the same *perfect* focus as M, is impossible; and examination with a microscope will prove this. Of course, there are plenty of inferior lenses which will not focus even *any* one plane perfectly: with these, no doubt several planes will appear in "equally good focus." The fact is, such lenses have *no focus at all*; for there is only one focus for a perfect lens and a given object. We have not space here to treat of the laws of optics; but reference to any text-book will prove our statement to be correct.

**Practical Sharpness.—Discs of Confusion.**—When the image produced by a lens is "perfectly sharp," every point in the object is represented by a point in the image. Now our eyes are not microscopes, and it is found, in practice, that if any point in the object be represented in the image by a dot or circle, whose diameter is not greater than the two-hundred-and-fiftieth part of an inch, it cannot be distinguished from a point. Moreover, it is found that if the diameter of the circle or dot be as much as the one-hundredth part of an inch, the image yet appears reasonably "sharp," distinct, and "in fair focus."

But when the circles or discs, which in the image represent points in the object, begin to exceed the hundredth part of an inch in diameter, then they markedly overlap and interfere with one another, and the image appears blurred and confused. Hence these circles (representing points) are called *discs of confusion*.

It is for this reason—that the discs of confusion do not exceed the hundredth part of an inch in diameter—that we are able to obtain photographs which, to our eyes, appear "sharp all over" and "in focus in every plane." The fact is, that only one plane can be in *perfect focus*; but the blurring of objects in the other planes is so slight that our eyes do not detect it.

**Testing Lenses.**—There are only about eight firms in England who are actual makers of photographic lenses. By purchasing from one of these firms you have the practical security of getting a satisfactory article; and further, should you at any time wish to dispose of your lens, you will not have much difficulty in getting a fair price—say about two-thirds of the amount which you gave for it. Great numbers of cheap lenses are imported from France; and while these are generally good value for the money, it is impossible that they can be of the same uniform excellence and reliability as the productions of an English house of good standing.

Yet it is a rather surprising fact that the lenses of even our best makers are not always to be relied upon in the figures as to focal length, ratio of stops, etc. Thus the focus of a whole-plate lens is given in the maker's catalogue as eleven inches, whereas careful measurement shows it to be really  $10\frac{5}{8}$  inches. This of course affects the relationship of all the stops; but when the stops come to be measured, it is found that they agree with neither the one nor the other focal length; the stop marked  $f/8$  is really  $f/9$ , and so on. Such errors may be thought small and unimportant, but

they introduce an element of inexactness which affects every exposure and every application of the lens.

At the Camera Club Conferences of 1888 and 1889 I proposed that Kew Observatory should undertake the testing of photographic lenses, just as for many years it had tested barometers, thermometers, and other scientific instruments. The matter has been taken up by Mr. G. M. Whipple, the able Superintendent of the Observatory, and plans have now been completed by which any lens can be tested, and an official certificate or warranty given with respect to its performance. For a fee of half-a-guinea the following information with respect to a lens is given:— (1) Equivalent focus (= focal length of lens); (2) ratio of diameter of each stop to the focal length (these are the "f" numbers); (3) angle of field of view, and size of plate effectively illuminated; (4) number of external reflecting surfaces; (5) coincidence of visual and chemical foci; (6) presence of flare-spot; (7) workmanship of surfaces, structure and degree of transparency of glass; (8) centring in mount; (9) defining power; (10) relative quality of illumination in different parts of field; (11) amount of astigmatism or optical distortion.

For a fee of half-a-crown a certificate is given, stating:— (1) The equivalent focus (= focal length); (2) size of effective aperture of lens with largest stop; (3) angle of field of view; (4) size of plate effectively illuminated; (5) coincidence of visual and chemical foci.

Applications for forms of entry are to be made to the Superintendent, Kew Observatory, Old Deer Park, Richmond, Surrey (endorsed "Test Department").

It is earnestly to be hoped that purchasers of high-class lenses will insist on having a "Kew certificate" with each lens. At the Camera Club Conference of 1888, to which we have already alluded, Mr. Dallmeyer said that "as an optician he would be quite willing to have his lenses tested by the Government, as proposed by Mr. Harrison. He was quite as anxious to turn out first-class work as the public was to buy it;" and we believe this to be the attitude of all our bona-fide lens-making firms on the question.

(To be continued.)

## Our Contemporaries.

The *New York Times* says:—"From a letter of inquiry received at the Treasury Department it is inferred that some persons think the copyrighting here of a photographic reproduction of a foreign painting or other work of art bars any later coming from the privilege of photographing the same thing and copyrighting his works. Librarian of Congress, Mr. Spofford, who issues all copyrights, said that this was a decided mistake. Any person who chooses to secure a copyright of a photograph of the work of a foreign artist can do so by making application and paying the fee. That will prevent any other person from reproducing the copyrighted photograph, but it does not hinder anybody from taking an exactly similar photograph of the same painting and getting his photograph copyrighted. Mr. Spofford said that his duty in issuing copyrights was purely ministerial, and he has nothing to do with the question of infringements. But he is of course, thoroughly familiar with copyright law. Mr. Spofford pointed out that the uniform decisions of the courts have been that infringement of copyright is the appropriation of the work of the person protected by copyright. The copyrighting of a city directory, for example, prohibits any other publisher from taking the names from the directory and publishing them, but it does not prevent him from collecting the same names, publishing them in the same alphabetical order, and obtain a copyright for his work. So the person seeking to copyright a photograph must not, by reproducing some other person's photograph, appropriate that person's work. He must take the photograph himself. The new copyright law makes no change in this respect."

*Wilson's Photographic Magazine*, speaking of "the permanency

of collodio-chloride photographs," says:—"There seems to be a misapprehension abroad, that because the body of the image is all close to the surface, that therefore there is not enough of it to stand the ravages of light and air. This mistake has arisen from the evident fact that in some of the porcelain prints there was not enough silver and gold to make a permanent picture; this was the mistake of the photographer. In albumen printing, if he did not give a sufficient body of chloride of silver to make a strong picture, he was confronted with unbearable measles, and when he took hold of the porcelain work he found he could produce a print of infinite delicacy without a trace of measles, and so ran to the other extremity, and forgot that there was enough deleterious matter in the air to speedily destroy the homœopathic attenuation of silver and gold which gave him this delicacy. This swing of the pendulum has brought so much discredit on porcelains that it is doubtful if they will ever become popular in this country, while in England, I am informed on reliable authority, that neither porcelains nor collodio-chlorides on paper fade, except in cases of careless manipulation, and these cases have not been so frequent as to bring that class of pictures into disrepute, but, on the contrary, they are held in the highest esteem by that most critical of all classes—the British aristocracy. It certainly is possible to make very nice looking collodio-chloride prints on paper with such a very slight reduction of the halogen salt that the fixed print will fade rapidly, but it is not necessary, nor even easy. The delicacies of the values is due not to the thinness of the silver deposit but to the fact that it is concentrated on or very near to the smooth surface."

*Invention* says: "A platinum mirror which has the peculiar property of both transmitting and reflecting light is noticed in *La Nature*. Behind the mirror is placed a movable panel or shutter, and between this panel and the glass a picture or photograph. When the panel is opened the reflection disappears, and the picture or photograph appears. These platinum mirrors may be used for other purposes. Placed in the panels of doors, they will light up a corridor or a gloomy room, and on the other side they form mirrors, so that, standing on the reverse side—that is, the platinised side—one can see through the glass without being seen. *La Nature* gives the formula for the preparation of platinum solution."

*Anthony's Photographic Bulletin* says: "The following method is recommended for obtaining a glacé finish on albumen prints without the aid of gelatine. A glass plate is coated with a mixture of ox gall and alcohol in equal parts, which has first been allowed to stand for several days with repeated shakings, and finally filtered. The washed albumen print is then placed in contact and squeezed down, and after drying for about an hour will come off with a beautiful glazed surface. If the print is to be mounted and the gloss retained, it should be covered as soon as transferred to the glass, with a sheet of parchment paper somewhat larger than the print, previously coated with starch paste, and then treated on the back with a good coat of gum or dextrine. It may then, when dry and removed from the glass, be placed in contact with a moistened cardboard, and subjected to pressure."

*Engineering*, speaking of "Photographic Surveying," says:—"From a recent paper by Lieutenant Reed, of the United States Artillery, we learn that photography has been largely used for surveying in Canada under the direction of Mr. E. Deville, the Surveyor-General. The Dominion survey made in the ordinary way proved very expensive and slow when the Rocky Mountains were reached, and photography was accordingly resorted to. The camera used was a carefully made mahogany, brass bound, rectangular box, half plate size; and, in use, was placed on a tripod furnished with levelling screws, and levelled by means of two ordinary tube levels attached at right angles to each other and which could be placed on that face of the camera which happened to be uppermost. The means for determining the horizon and principal lines were the images of four fine combs, one midway on each side, attached to the camera immediately in front of the plate—the use of small stops making these images clear. The lens used was a Dallmeyer wide angle, No. 1 A, of  $5\frac{1}{2}$  in. focus, affording a horizontal angle of 60 deg. when the plate was disposed with its longer edge horizontal. Six double plateholders were employed. But one adjustment of this camera is required, viz., to insure the verticality of the plate when the tube levels indicate that the camera is level. The best way to effect this is to substitute for the plate a good plane mirror, face to the rear; then

set up a transit in the vicinity; the axis of the telescope being horizontal, observe a distant point intersected by the cross wires, also its image in the mirror; if the latter is also intersected, the mirror is vertical; if not, then the tube levels need adjustment. This box camera being rigid, and the focus therefore "permanent" and suited to distant views, and the lines on the faces indicating the field of view, no ground glass or cloth is needed. Care is taken to make the plateholders exactly alike, a condition which, so far as distance from lens to plate is concerned, is ascertained by measurement. Orthochromatic gelatine plates give the best results. Dr. Deville considers that a survey made this way is as accurate as a plan plotted with a very good protractor or made with a plane table. A good deal of attention has been devoted to the subject in France by Dr. Gustave le Bon, who has shown how to obtain all the survey details from a single photograph, and one compass observation, provided any one distance contained in the photograph is known."

## Notes from the Edinburgh Centre.

(From Our Own Correspondent.)

CONTRARY to custom and to expectation also, there was a good attendance at the closing meeting for the season of the Edinburgh Photographic Society, on 3rd inst. Mr. H. J. Blanc, the President, was in the chair, and according to the recently adopted rule, he at once called upon Mr. J. M. Turnbull to introduce the subject of "Printing Out Platinum Papers." Mr. Turnbull said it was long the reproach of photography that the silver was the only process of printing, and that the results were not permanent. There was no doubt that, with all its beauty, silver printing was not permanent. The carbon process was for a long time looked upon as a process of printing which gave permanent results, and which no doubt it did, but it had not held the field. The metal platinum, it was thought, would give permanency, and after a good deal of effort, Willis, in 1874, patented his platinum process, and the Platinotype Company's products came into the market. They gave most beautiful results, but were somewhat difficult to work, because of their tendency to succumb to the least trace of damp. He had with him a number of specimens in printing-out platinum papers, which were worked by a process a good deal different from that of the Platinotype Company. This paper contained, as it were, the developer within itself, being charged with a ferric salt. After it got the light, a little moisture and heat accelerated it. When the image came out a little more than was wanted, it was cleared by a little hydrochloric acid and water. That was all that was required. The process was so simple, that one who knew almost nothing of photographic printing could do it without difficulty. The first paper brought out by Pizzighelli was not very good, but it had now been very much improved. He showed specimens of printing upon various papers, including Dr. Jacoby's, and Hardcastle's, of Brighton, with, by contrast, to show the fine results got upon printing-out platinum papers, several of the same subjects upon silver paper.

Mr. J. M'Glashan said he had used these printing-out papers. When he began he did not get very good results, he supposed because he followed the instructions on the paper. He found that if he printed the paper as dry as possible, he got by far the best results.

Mr. J. R. Roddick, in giving his experience, said he always found that on a very bright day the blacks were richer and purer than on a dull day.

Mr. Turnbull, in closing the discussion, referred to remarks which had been made regarding the unreliability of some of the printing-out papers, and said that on account of its not being floated, but having the solution painted upon it with a brush, inequalities were apt to arise, but that seemed to have been overcome by coating the paper several times and allowing it to dry between. Printing the paper dry had this drawback, that they could not tell what depth the image would assume when moistened, and they might spoil a few prints. The moisture which he spoke of as necessary was very slight, and not so much as would make the paper adhere to the negative.

The Chairman thought the process a very simple and valuable one, and it was certainly an advantage to them to have the experience of Mr. Turnbull and Mr. M'Glashan on the subject.

Mr. W. Dundas Todd was then called upon to introduce the sub-

ject of "Exposure Tables and Meters." He had, he said, set himself to become possessed of everything relating to his subject that was advertised, and he found that only one of them gave complete instructions as to the use of the meter; the others were all blank. He found also that two of the tables gave different times for the same plates, and therefore, if the one was right, the other must be wrong. One of the meters he described as about the most awkward thing he ever handled in his life, and therefore he could not recommend it. Another, which worked by a strip of sensitised paper, and had a card along with it, from which the exposure could be found, would work fairly well. Another meter, working by a strip of sensitised paper also, and giving all the calculations upon itself, he found to be absolutely reliable. "If," said Mr. Todd, "you want a really reliable instrument, one that you can use any time of the day, or night almost, go in for —s." (I think it would be unfair to other manufacturers to give a free advertisement here to one maker.)

The Chairman thought the meters did no more than could be equalled by the practical instincts of any decent workman. At their recent outdoor meeting at Inverkeithing he made what he thought was a blunder in giving three seconds exposure, and he exposed another plate, giving it only one and a half seconds. He produced the two negatives at the meeting that night, and said they could scarcely tell which had the longer and which the shorter exposure. The conditions of light were the same in each, and the developer was the same (hydroquinone). A meter he looked upon as an encumbrance.

Mr. Turnbull could scarcely agree with the Chairman about the two negatives he showed. It was quite easy for the practised eye to tell which had the longer exposure. He warned the members against using the same developer more than once. Every time it was used weakened it. It was just as if a man who had run a mile were asked immediately to run another; he was not so able to do it. They would find it very poor economy to save developer at the expense of plates. He thought that the photographer who was always taking views could do without a meter, but one who only went out occasionally could not be aware of the quality of the light, and for him a meter might be useful.

After several questions had been put and answered, Mr. Todd, in replying, said he once doubted the efficacy of meters, but he did not any longer. He was prepared to go out with anyone and expose half a dozen plates, by meter, against theirs without meter, and he would put them all into the same developer, and he knew what the result would be.

In reply to this, the Chairman said he had recently exposed about 230 plates, and had only about fifteen failures, and he was quite prepared to take his own experience rather than indulge in a meter.

The Chairman then intimated that their next outdoor ramble would be on Saturday, the 6th. He asked that the members attending these meetings should contribute a copy of whatever they took, to be placed in a society album. Such an album would be found very interesting as years went on. They might establish a series of albums which could be exchanged with other societies. He understood an appeal had been made by a society in Australia for an exchange of photographs with them, and he was sure such an exchange would be very interesting. This very sensible announcement was received with much gratification, and doubtless the members will do their best to oblige the President in this matter.

The Chairman then introduced the proposal to invite the Photographic Convention of Great Britain to meet in Edinburgh in 1892, and moved that the Society vote £10 towards a guarantee fund. He did not hesitate to say, he said, that it would be a very desirable thing to have next year's meeting of the Convention in Edinburgh.

The Secretary reported that he had inquired in Glasgow as to the arrangements which were made there for the Convention meeting some years ago, and he stated shortly what these were, after which the Chairman's motion was agreed to.

On the motion of Mr. W. Brown, seconded by Mr. J. M. Turnbull, it was resolved to extend the proposed invitation to the Convention, and the Council of the Society were empowered to appoint one or two of their number to attend this year's Convention and convey the invitation. The proceedings were most cordial.

Since the advent of photography, astronomy, which was one of the exact sciences before, has been made more exact still. It

was my good fortune on Saturday last to be an eye-witness of the movements of Mr. Wm. Peck, the City Astronomer of Edinburgh, and his assistants, in their observation of the eclipse of the sun. The observations were almost exclusively confined to photographing the eclipsed sun at intervals of a few minutes, by means of a 13 in. equatorial telescope, which was driven by clock-work so as to keep the sun always in the field. As many as twenty exposures were made upon ordinary half-plates. The sky was clear, and the light being if anything, too strong, very slow plates were used. The photographs are, of course, intended for purposes of measurement. Mr. Peck is—as every astronomer must now perforce be—an adept amateur photographer, and has produced some charming views of the moon.

On the same afternoon the members of the Edinburgh Photographic Society were holding their second outdoor ramble. I am afraid there is not an astronomer on the council of the Society, else an afternoon upon which there was to be an eclipse would not have been selected for the ramble, but as it was the light was excellent, only a fourth of the sun's surface being obscured, and the conditions were consequently very favourable for doing good work.

## Thursday Evenings at the Camera Club.

BY ONE OF OUR STAFF.

CAPTAIN Abney occupied the chair on the 4th, as it was right he should do, as Mr. Maskell was to read a paper in reply to that of Mr. Joseph Pennell at the Conference, when the Captain also presided. Mr. Maskell selected, for the title of his paper, "The Claims of Photography to Recognition as Art;" it was somewhat long, but extremely interesting, and though it did not profess to go so exhaustively into the subject as to fully prove its case, what was presented gave a broad hint of the still greater weight of evidence which could be brought forward on a future occasion. The reader pointed out that the extent of ground to be covered in an argument which had for its object the establishment of a claim on the part of photography to artistic recognition was so great that the temptation to wander into side issues was almost irresistible. He should endeavour to confine himself, therefore, to a few of the principal considerations which he ventured to submit to Mr. Pennell's criticism, in the hope that they might at least achieve something towards abating in his mind, and in the minds of those who think with him, their attitude of uncompromising hostility. If the paper read at the Conference were taken, they would find that the strictures on photography as an art were not very numerous, and they might be summarised as follows:—1st. Photography is not a fine art, and never can be. 2nd. The photographer uses an unintelligent machine. 3rd. The nearer a machine-made photograph seeks to approach artistically-produced art, the more glaring are its defects and the more evident its shortcomings. 4th. Photography never does, and never can make selection. 5th. Photographic perspective is wrong—from the artistic standpoint. 6th. The painter's tools are everything to him, and the photographer tries to make a machine equal them, and does not succeed. 7th. Photography is incapable of correctly rendering tones or values. 8th. It is a mechanical method, and therefore not art. 9th. It is incapable of individual expression, and consequently cannot produce a work of art. These were the principal heads of his accusation, and, of them all, the most important was the last one which he had stated, viz., that photography was incapable of individuality. It was upon the refutation of this assumption that he would rest his case, for it was upon this point that photography as an art must stand or fall. The reader dealt with these points seriatim. He said that it was charged that poetry was mechanical. "Mechanical—to a certain extent, yes, but it is mechanism under control, and the advantage is that Nature herself, by the agency of light, in a mechanical manner forms the groundwork of the picture, and, if properly controlled, will effect this in such a way, with such delicate and true gradations of light and shade as would require the hand of the greatest master of the brush to rival. It is, therefore, no slur upon photography to say that it is mechanical, so long as the mechanism can be controlled by intelligence; on the contrary, it is a glory that by its means we can convert nature into a docile and obedient servant. The extent to which we can

control her measures our claim to be considered artists. I have before now attracted a certain amount of derision because I have asserted that a photographic picture is a better and more artistic production the less it bears resemblance to a photograph. Of course, such a statement must be intelligently understood; but it is true nevertheless. The art of being artistic in photography consists, in great measure, in concealing the method by which the effect is produced. It is the old story over again—'*Ars est celare artem*,' or, if I quote Mr. Whistler aright, a picture is finished when all trace of the method of making it has been lost. So with us, provided we have used the legitimate tools of our craft, it is a merit if the result does not show on the face of it—boldly, broadly, brazen-like asserting itself—the means employed. Let those sneer who will; it is a legitimate pleasure to hear it said that one's work in photography is not photographic. We are told that the photographer uses an unintelligent machine. Well—the brush and the palette, are they intelligent? Of course, in both cases, the intelligence is, or should be, in the user. I will not say I am prepared to accept Mr. Pennell's challenge on the subject of tones or values. I will not assert that I am acquainted with any photograph in which fault cannot be found in respect of these. Neither in photography nor in painting can we reproduce the highest lights of nature as they are in reality, and in photography especially our inability to prevent the shadows from being too dark is an admitted grave restriction. But, in the same way as in painting, a compromise being accepted, it is often the fault of the artist himself, rather than of the method, if relative values are not as well expressed as they might be. I would ask Mr. Pennell and others who know the powers given to us by photography to concede the possibilities of success, and to assist us by their counsel rather than to depress our efforts by hasty and wholesale depreciation. If he asks me what grounds I have for such hopes, I will answer that I ground them on the fact that men of undoubted artistic perception now endeavour to reduce the mechanism of photography to its simplest expression, to treat its mechanical triumphs as of scientific interest only, and to make individuality and character the chief aim to be attained. They know well the disabilities, and they look forward to a greater perfection of the method. The most important question at issue is whether the faults are inherent to the system, or whether they are due to the worker—artist, if I may be allowed to call him so. If to the former the case would be hopeless, but if to the latter there is more than ground for hope, there is certainty of success; and although we may have an uphill battle to fight, although we cannot anticipate that we shall succeed in silencing all opposition at once, yet it is our duty to make ourselves heard, to press our claims, to break down prejudice, to enlighten ignorance, and to trust with confidence that the work we produce will eventually more fully succeed in establishing the claim which I have endeavoured, however incompetently, to advocate."

The paper was loudly applauded, it being evident that the members of the Club were delighted to see that somebody was taking up the cudgels in defence of photography which had been so severely attacked by Mr. Pennell.

Mr. Humphrey read a paper by Mr. A. Burchett on the same subject. The paper was short, but the writer pointed out that if Mr. Pennell's contention that photography was not a fine art were true all photographs ought to be alike, but they were not, for every one who looked at photographs with knowledge would see individuality in the work of the various men. It was absurd to compare photography with painting, in which the painter painted and left out just what he chose. Photography should stand independently as a fine art, having the two qualifications that it showed individuality, and was under the control of the mind. The artistic photographer must fully understand the capabilities of his lens, and use it more for expressing his idea of nature.

The Rev. F. C. Lambert, who had come fully prepared with notes, took up the parable, and said that Mr. Pennell's remarks might be divided into two parts: the dogmatic and the prophetic. On the latter point he would say nothing, as a man was not of much account as a prophet in his own club. A painter could alter the place of or omit a mountain, or change the direction of a river bank, but he (the speaker) would call that creation and destruction, and not selection. The photographer, though he could select his point of view, could not perform those giant feats. That painters carried their power to excess was

matter of ancient history, and he had seen landscapes which if placed beside photographs of the same spot would have awakened new feelings in the painter. Modern painters would find in photography as much power of selection as was good for them, by a proper choice of lenses and proper after-treatment of the plate and prints, but he must be content to put up with nature as she is and not as he thinks she ought to be. He quite differed from Mr. Pennell's six camera proposition for one photographer would be able to get six quite different negatives without moving his tripod legs; in fact, the difficulty was to get two negatives alike. If the photographer received different impressions of a view, and asserted that his productions recorded that impression, was he to be condemned by those whose impressions differed from his own, who were not likely in the course of nature to see with his eyes? It seemed to him a case of "orthodoxy is my doxy, and heterodoxy is any other fellow's doxy." This view seemed to be generally acceptable to the members of the Club.

Mr. F. E. Barber rather took Mr. Pennell's view, being neither a successful artist nor a successful photographer, and felt that the camera was a weapon which photographic artists—and he admitted that there were such men—fought against rather than with.

Mr. Andrew Pringle said on reading Mr. Pennell's paper he found it contained statements which it was not easy to believe came from a practical photographer. He himself had always held that photography could not aspire to be highest art because it could not give idealism, but yet there must be some quality of art in photography. As to the six cameras, he would remind them of a picture which he would call "The Somnolent Valley," which was admitted to be an artistic photograph, and though other photographers had gone to the same spot they had not secured such a picture as did "Mr. Wind." There was also a photograph by Mr. Sutcliffe of the hinder end of some boys who were looking over a wall; that was considered to be a picture, though it would not be a promising subject for many of them. There was something which caused one picture to have a certain amount of artistic effect and another to want it, and that something must be art. He believed that photography would never be capable of rivaling art, and he hoped it would be so. Photography was an art, but it was not a rival of sculpture or painting.

Major Nott agreed thoroughly with Mr. Pringle as to the position of photography; it was an art in itself, and quite distinct from any other. It was a new art. He did not agree that it should be used as by Mr. Maskell and others, for by that process its beauty was destroyed. He would draw a parallel. History was literature and so was fiction. Painting was, so to speak, the fiction of art, and photography the history. Photography was an art, and when it had reached absolute perfection it would be an art with which no painter ever could or ever would compete.

Mr. Davison read a paper for Mr. Hinton, who said it was a fact that painters whose position was assured did use photographs. It was unfair to compare painting with photography—one was centuries old while the other was in its infancy. The real question was whether past photography had not sufficient in it to justify the conclusion that with increased knowledge of its capabilities it would give the intelligent worker such results as would leave no doubt of its artistic merits in the mind of competent judges.

The Rev. — Whatton said it seemed to him that photography had been trying to show that it was intended to do the same thing as painting, though not so well. He did not think it should do that. Photography, in his mind, held a position, in relation to painting, which was similar to the relative positions of violin and organ. Neither instrument would do the same work as the other, and yet both were perfect in their own spheres; the violin was the mother of melody, and the organ of harmony.

Mr. G. Davison said they might admit that there was in most photographs an absence of poetry, and want of sentiment possibly, but there still remained in connection with the best photographs the fact that there was a naturalness about them which in the long run would have some effect on the mind of the public. Mr. Davison also joined issue with Mr. Pennell on the question of photographic perspective, which he held was absolutely correct, while that of the artist was falsified.

Dr. Patterson thought it unfair to compare the work of amateur photographers who only gave their spare time to it, with that of professional painters who devoted their whole life to

their work. In his view photographic perspective had been greatly blurred in the artistic mind by the way hand-cameras were used by the best artists of the day.

The Rev. F. C. Lambert pointed out that photography was practically limited to the possible, while artists were practically not limited. They made a great mistake in trying to measure one art by the canons of another.

Mr. Pennell made a long and rambling reply, in the course of which he had to be constantly corrected as to the remarks of previous speakers, having apparently made no notes whatever. He said that in the six-camera proposition he spoke of them being placed before a flat object such as a painting, and he still held that the six photographs would be the same; whereas six artists would give six different views of it. Mr. Maskell admitted that to a certain extent photography was mechanical, but claimed that photographers could control nature. He had never heard of anyone doing that except Moses. If photographers could do it, artists would be content to give up painting and go in for photography. He was asked whether photography could ever be admitted among the fine arts; he had no more idea than Mr. Maskell what it would become, but at present he did not see how it could. The most important thing now in art was the rendering of tones, and he thought painters could do it more truly than any machine. An artist instinctively selected his point of view and arrangement, and the man who could give them the greatest amount of genius, ability, and truth was a great man. Photographers said they were impressionists and gave their impressions; he did not see how they did so. They focussed the picture, but the impression produced was that of the film or plate, and not their own at all. The impression was a mechanical one, and that was the great point of the whole thing. Art was not representing nature as she was; art was adjusting nature, and the man who could leave out in the best manner was the greatest artist; they did not bother about topographical details. If a photographer put a figure in the foreground with his hand two inches in front of him, the hand would be twice the size it should be (No, no); all artists had tried it and found it so. He could not explain why it was, but if they tried to change a photograph into a drawing it was all wrong. If an artist were drawing a cathedral he would erect his perspective from one point, and then move a little one side or the other, and put in other points to give a comprehensive idea of the building. If they could only convince artists that photographic perspective was right, they would be only too glad to use it.

Mr. Maskell found it hardly necessary to make a reply to Mr. Pennell's comments on his paper, but he very justly pointed out that it was a pity Mr. Pennell had not taken the trouble to consider the arguments put forward in the paper, a copy of which he had some days before the meeting. Mr. Pennell's arguments were, to his mind, scarcely worth replying to; if it were worth that gentleman's time to contend the question at all, it was surely worth his while to contend it in a more careful manner. As it was so late, he would not take up their time further on the matter, though he had very much to say.

The Chairman, as a scientific man, thought both sides were wrong, and that Major Nott had very fairly represented the claims of photography. Mr. Pennell's original paper seemed to him an admission that artists were not able to draw correctly what they saw before them. The case of the cathedral was one in point; and after examining a great deal of artistic perspective he could say it was false, whereas photographic perspective was mathematically correct. He was quite sure the six cameras would not give six similar negatives, and if the six artists gave six different copies, five out of the six must be wrong. With regard to artists putting into the picture what was not in the view, photography could do that also. There was a picture by Mr. Robinson in the library showing a room with an old lady and an old man in it, and yet those two people never saw each other in their lives. Certainly that was a work of art. It was true that the photographer had no control during the exposure, but when he took the plate into the dark-room a man of education was so able to manipulate it as to get the best results. A photographer was compelled to sacrifice something, but so must an artist. Mr. Pennell had received a good pounding, but he had given back as good as he got, and neither side seemed depressed. He hoped Mr. Pennell would again favour them with his company and his esteemed comments on photography. He would them to pass a hearty vote of thanks to Mr. Pennell and those gentlemen who had contributed papers.

## Reviews.

*Photography Annual*, 1891. Edited by Henry Sturmer. London: Liffé and Co., 3, St. Bride Street, E.C. 2s.

This book has in it little that is original, much that is true, and much more that is not new. Its proportions are gigantic, and the editor can claim to having exhausted the contents of all the catalogues of makers and dealers in photographic apparatus and materials, and further to have produced a book which may help editors of the photographic press, but one which we venture to think will not be popular with our constituency, the amateur photographers.

The illustrations are for the most part fair specimens of commercial photo-mechanical processes, but have no claim to illustrate photography as an art, and exemplify no new features whatever, nor have they any connection with the text.

Section I., "Useful Tables of Reference for Practical Photographers," contains practically nothing but what has been published over and over again.

Section II., "Tips for Tyros, being useful hints on Photographic Procedure for the use of Beginners," is a colourable imitation of the "Amateur Photographer's Annual," but devoid of any order of procedure whatever.

Section III., "The Annals of Photography, being a record of Progress during the year 1890," divided into parts. The author of the first part, Mr. C. H. Bothamley, F.I.C., F.C.S., is a gentleman capable of doing justice to "Photographic Chemistry," but of course he is quite unable to do so within the limits of some forty pages. The value of the "record" is greatly discounted by the fact that in scores of instances only a reference is given to one or other of the photographic journals published in this country, or to those published on the Continent. To get the full value of Mr. Bothamley's record, it is therefore necessary to have access to the files of no less than forty-six photographic publications. In the next part Mr. Albert Taylor, F.R.A.S., writes upon "Astronomical Photography," and fills twenty pages with matter of interest only to astronomers, of whom we take it there will be few among the readers of "Photography Annual." Other articles in the "Record" are contributed by Captain Abney, Messrs. G. M. Whipple, Andrew Pringle, H. Chapman Jones, T. Bolas, and Rev. F. C. Lambert.

Section IV. is devoted to "Selected Articles on Practical Subjects by Practical Men," in which there is "much that is true, and but little that is new." These sections occupy in all some 200 odd pages.

The rest of this huge book of 820 pages is mere compilation of but little practical use, except as a catalogue of photographic apparatus and material.

The work of compilation and indexing is admirably done, and the book must have entailed an enormous amount of work upon the editor and his colleagues, but we cannot help expressing our opinion that in introducing so largely the catalogue element a great mistake has been made.

*Elementary Systematic Chemistry.* By William Ramsay, Ph.D., F.R.S. London: Messrs. J. and A. Churchill, 11, New Burlington Street.

This book is written for the use of schools and colleges. It is made exceedingly interesting by the method of grouping and classification, so as to render the apparently disconnected facts less perplexing to the student. The first part deals with Chemical Physics—Energy—Heat—Solids—Liquids—and Electricity. Part II., Inorganic Chemistry—The Elements—Compounds—Typical Compounds—The Halides—The Oxides and Sulphides, etc. Part III., Chemistry of the Carbon Compounds—Paraffins—Alcohols—Acids—The Olefines—Benzene and its Homologues, etc.

The chapters are divided into lessons. Many will find the book of great value. A knowledge of chemistry is very helpful in photography, and many might, with advantage, study this book by Dr. Ramsay, who is an admirable teacher, and has given to the student a well compiled and arranged hand-book on elementary chemistry.

**Croydon Camera Club.**—The Secretary of the club, Mr. G. R. White, has kindly supplied us with a list of excursions so far as they have been arranged:—June 6th, Merstham to Godstone; June 13th, Leatherhead; June 20th, Kingston to Hampton; June 27th, Betchworth to Dorking; July 4th, Oxted to Godstone.

## Exhibitions.

### EGYPT IN LONDON.

(By "LOITERER.")

THERE are fifty-six extremely interesting pictures by A. N. Roussoff now being exhibited by the Fine Art Society. A striking contrast is presented in "Past and Present" (10), where some natives are contemplating the tombs of the caliphs. "The Sphinx" (14) is finely painted, and "Water Carriers in the Desert" (18) gives a vivid view of the sandy desert. The characteristic effect of "Sunset after a Strong Hamzin" (19) will be appreciated by travellers up the Nile. M. Roussoff has adroitly painted "Sunlight and Shadow" (23), while its neighbour, "Hastening Home," is striking. The busy life of the bazaar, with saleswomen as importunate if not as elegant as those who preside at English imitations of this Egyptian scene, is capitably painted (25). The most ambitious picture in the exhibition is "The Citadel, Cairo" (26), which deserves great praise for its fidelity and skill. The atmospheric effect shown in "The Pyramids of Cheops and Chephren" (45) is very truthful. Even Scrooge could not refrain from smiling at the good-tempered face in "Welcome" (47). In the sketch entitled "Late Evening on the Nile" (55), one recognises the peculiar yellow tint of Egyptian scenery. The "Fruit Shop, Cairo" (56), is a delightful finale to an interesting series of pictures, upon which M. Roussoff deserves congratulations.

### EXHIBITION AT SUTTON.

The interior of the Public Hall, Sutton, presented a very pleasing picture on Tuesday last, on the occasion of the opening by H.R.H. the Duchess of Albany, of the bazaar in aid of the Christ Church building fund. The stalls were draped with striped materials to represent tents, and the stallholders were attired in dresses of the time of the Field of the Cloth of Gold, which the arrangement of the hall was intended to represent. Many of the dresses were extremely artistic, and the general arrangement of colours was harmonious and delightful. Having formally declared the bazaar open, Her Royal Highness descended from the platform and made a tour round the stalls, making numerous purchases, including a professional view of the church, and a view of the Cornish coast by the vicar, the Rev. J. B. C. Gale.

In connection with the bazaar was a photographic competition open to all comers, the judges being Messrs. A. R. Dresser, Chivers, E. Frampton, and Captain Scott. The entries were fairly numerous, and the awards well deserved. The gold medal went to a professional, Mr. Gibson, of Hexham, for a landscape with figure, "When the Day Burns Low," which was a charming sepia platinotype. Mr. J. E. Austin took the silver medal for a snow scene, "Winter." The bronze medal was secured by Mr. Murchison, Sutton, for a fine platinotype view of the interior of the Archbishop's Chapel, Lambeth Palace. Certificates were awarded to Mr. C. James, of Louth, for "You Dunce!" one of the dog series which he sent to the Crystal Palace Exhibition; to Mr. J. E. Austin, for "Chaff," also a Palace picture; and to Mr. Gibson, for a view, "On the Tyne."

Among the other pictures deserving of notice were four quarter-plate platinotype views by A. W. Bawtree; a platinotype print of "The Hall, Worden Grange," by H. W. Reeves, of Willesden; another of "The Reredos of Salisbury Cathedral," by W. H. Bois; "Friar's Cray, Derwentwater," by A. W. Bawtree; "Cottages at Harrow," and "The Garden, Hull Place, Tonbridge," by H. W. Reeves.

**Received.**—Messrs. Taylor, Taylor, and Hobson's new catalogue. A full description of the goods manufactured and sold by this firm was given in a recent issue of the AMATEUR PHOTOGRAPHER.

**Developing Trays.**—Light trays are much appreciated by all workers in photography. The Xylonite Company, Homerton, E., have sent us samples of their developing trays, which are very light, very strong, beautifully made, and admirably adapted for the purpose. It has been stated that they must not be used for "methylated spirit baths." It is very rarely that developing trays would be put to such a use, but we at once subjected the "Xylonite" trays to the tests, and found that methylated spirits had no injurious effect whatever upon them. They are made in different colours, and, of course, in all sizes; we strongly recommend their use; they are practically unbreakable, and very clean.

# **"Amateur Photographer" Dark-Rooms, 1891.**

THE "DARK-ROOMS" kindly placed at our service for the use of amateur photographers are classed as follows:—

*a* Amateur      *d* Dealer or professional.  
*h* Hotel      *s* Photographic society.

NOTE.—At the time of going to press we have not received signed authority for the use of "Dark-rooms" marked\*; but they were all placed at our disposal last year, and are doubtless available.—ED. AM: PHOT:

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and *plainly* endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

## Holiday Resorts and Photographic Haunts.

### STIRLING.

THE town itself, with its narrow, steep streets (or "wynds"), afford plenty of scope, while the views of the Castle from different points, of the High Church and of the old bridge, are only too well known. A good general view, however, can be obtained from the footpath by the river north of the railway station (early morning), or from the other side from the rifle-butt on the Dumbarton Road about an hour later, showing the Castle on its high cliffs, with the beautifully wooded "Backwalk" (overtopped by the spires, etc.) leading up to it. The immediately surrounding country supplies (especially the neighbourhood of the famous Gillieshill) ever-changing scenes of rocks and woods and streams. But it is especially as a centre that Stirling is pre-eminent, as the following may show:—

Alloa (7 miles rail, 3rd return 8d.), an old town with a tower connected with the Bruce, as is also Clackmannan Tower, about 3 miles distant.

Alva (8 miles rail, 1s. 4d.), a pretty glen with three falls, at the foot of the Ochils.

Dollar (13 miles rail, carriage 2s. 6d.), another glen (wilder) with an old stronghold, Castle Campbell; permission necessary.

Bridge of Allan (3 miles, both tram and rail, 3d.) Near this are the grounds of Keir, Kippendare, and Airthrie (permission necessary for all), as well as the Wallace Monument on the Abbey Craig.

Dunblane (6 miles rail). Here there is an old cathedral with a fine triple window, and some nice river views on the Allan.

Doune, with its ruined Castle Callander, the entrance to the fairy-land of the Trossachs and the Pass of Leny, as described in the "Lady of the Lake" and "Montrose;" Aberfoyle, connected with "Rob Roy;" near it the Lake and Castle of Menteith. To the south are Campsie, another beautiful glen, and to the east Falkirk, with the great Canon Irons Work near it.

Truly a

"Land of brown heath and shaggy wood,  
Land of the mountain and the flood."

## Quarterly Examinations in Photography.

**Question 25.**—Define the terms *apochromatic*, *secondary*, and *tertiary spectrum*, and explain the two latter terms thoroughly.

ANSWER.—Apochromatic means the same as achromatic, and is the term used for lenses made from the new "Jena" glass, which, owing to the different refractive angles, or power, is capable of more perfect colour correction, and gives images almost free from secondary (or, as more correctly called, "residual") spectrum. The term is usually applied to microscopic objectives, which owing to the magnification need this point attended to more carefully.

A single lens acts as a prism, and white light passing through it is refracted, the blue rays being brought to a focus nearer to the lens than the yellow and red ones, *i.e.*, the chemical focus is shorter than the visual one. This might be overcome by placing another equal and opposite lens of the same glass in contact with the first, but then the two lenses would act as a piece of plain glass, and the light would pass out the same as it entered, and we should have no focus at all; but by using a glass of a different refractive power we can (whilst lengthening the focus) bring some of the rays to coincide with others, the remainder which do not coincide forming the residual spectrum.

For photography the rays about the line D are made to coincide with those about G, these two points being taken as the visual and actinic focus.

**Question 26.**—Explain the action of coloured glass in printing-out on silver paper?

ANSWER.—If we place the different salts of silver, in conditions similar to what they are in the paper, in the rays of a spectrum, we shall find that the first to darken is the chloride under the violet rays, and that by the time that it has darkened under the green rays (nearly twenty times as long) the other salts have also appeared; secondly, if we place these darkened salts in hypo (strong) we find that while the darkened chloride is largely dissolved, the others are only slightly affected.

It should have been noted that the violet rays do not affect the other salts of silver so rapidly as some of the rays nearer the red end of the spectrum, say between the blue and the green. Now, if we interpose a piece of glass cutting off the violet rays, we shall have the image formed of albuminate, etc., of silver, as well as of chloride.

It is possible also that, owing to the slower action of light, the chlorine is given off more regularly, and absorbed by the absorbent present, hence helping to form a stronger image. S. N.

**Question 27.**—Explain the mechanical principles involved in the construction of a tripod, and the laws to be observed to obtain the greatest steadiness, etc.

ANSWER.—There are three strains to be taken into consideration, looking upon a tripod as a table with three legs supporting the camera—

(1) Compression. This for the ordinary size of cameras is not a serious one, the weight of the camera being so little that the fibres of any wood or metal are quite equal to it.

(2) Bending. If we place a heavy weight on the top of the tripod we find that each leg will bend and form a slight arc. This is compensated by making the square section of each leg of such a size in proportion to the length as to prevent this bending. This bending will always take place if the weight is sufficiently heavy.

(3) Twisting. Owing to lateral and wind pressure there is a third strain which may be overcome by dividing the leg so as to make it with the head form a triangle. The resisting power increases with the length of the base of the triangle, *i.e.*, the length of the side of the tripod head. S. N.

### QUESTIONS.

31.—Write a brief note on the influence of development on gradation (350 words).

32.—How would you restore a yellow albumen print?

33.—Is there any difference in the resulting tint of a bromide print when the paper is exposed at 2 ft. or 6 ft. from the source of light? How would you calculate the exposures required at the latter distance, that at the former being known?

(Latest day for Answers, June 22nd.)

#### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

NOTE.—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT," AMATEUR PHOTOGRAPHER,  
1, CREED LANE, LONDON, E.C.

## Societies' Meetings.

**Ashton-under-Lyne.**—The monthly meeting of this Society was held on the 4th inst. Dr. A. Hamilton, President, occupied the chair, and there was a large number of members present. The Secretary then gave a report of the ramble to Strines, and Mr. W. Chadwick followed with a description of the outing to the Goyt Valley. After hearing reports, etc., a number of hand-cameras were put before the meeting, the owners explaining the various characteristics of each; amongst them were the Scott, exhibited by Dr. Hamilton; Chadwick's, Mr. W. Kenworthy; the Facile, Mr. Geo. Candlitt; Griffiths, Mr. Jenkinson; two, own made, Mr. Chadwick; and one by Mr. Secker. Considerable interest was shown, and opinions expressed as to their merits or otherwise.

**Brixton and Clapham.**—At an ordinary meeting of the Club held on the 4th inst., Dr. Reynolds, Vice-President, in the chair, Mr. W. H. Powell gave a most interesting paper on "Hand-camera Work," and this being a favourite subject with the members, was listened to

with great attention. The lecturer explained the use of several hand-cameras, amongst others Messrs. Marion's "The Radial," and Mr. Cusworth's "Repeater," which had been kindly lent by their respective makers. Mr. J. A. Butler, one of the members, also exhibited an excellent camera made by himself, which attracted considerable attention.

**Cardiff.**—Saturday's excursion (6th inst.) brought out a big contingent for Cowbridge. The journey was performed by road, and a short stay was made *en route* at the ruins of Beaufort Castle. Notwithstanding the uncertain weather, some good work was done for the survey. The party dined at the "Bear Hotel," and arrived back at Cardiff about 9 o'clock.

**Croydon Micro.**—An ordinary meeting was held on the 5th inst., Mr. J. A. Carter, M.A., in the chair. No paper being down for this evening, the results of the past excursion were shown by the members. Mr. Weir-Brown exhibited some bromide enlargements toned by uranium; he also mentioned with reference to mounting prints toned in this way, that care must be taken not to damp the face of the print when mounting, as a stain is left when the print has dried and if by chance the face of the print did get damp, he used a damp (wrung out) sponge, and then the face of the print made equally damp all over. Mr. Carter asked if it was necessary to always damp the prints. Mr. Weir-Brown said a sizing of starch at the back of the prints would prevent moisture, when mounting, from appearing on the print. Mr. Carter brought forward a proposition made by Mr. Weir-Brown some time back, that members should introduce subjects that would promote discussions.

**Holborn.**—At last Friday's meeting, Mr. E. H. Bayston in the chair, Mr. Herbert Thompson read a paper on the "Hand Camera," offering suggestions which the writer thought would be an improvement on some of the hand-cameras at present in the market, especially with regard to the finder, the lens, and the shutter. An interesting discussion followed, chiefly on the use of hand cameras, in which Messrs. Bayston, Golding, Luxton, Benest, and Raphael took part. Mr. J. Bush was elected a member of the club.

**Lewisham.**—At the meeting on the 5th inst., Mr. A. H. Miles, Vice-President, in the chair, Mr. M. Stodart gave his paper entitled "The Necessity of Care in all Photographic Operations," which, though mainly intended for beginners, proved most interesting and instructive to the more advanced workers, especially as it was practically illustrated. During the evening the prize (which consisted of two dark slides) for the developing competition, was presented to Mr. Hamerston. Next meeting, June 19th—"Chinese Artists," by Mr. Thos. Child.

**Lowestoft.**—At the meeting on the 5th, Mr. W. Springfield presiding, the Rev. A. Wells exhibited some very interesting slides, illustrating his travels in Constantinople, Florence, and elsewhere. Mr. Estcourt gave a further instalment of his stereoscopic views of Burnham Beeches, the tone and quality of which were excellent. Mr. A. M. Smith also produced some half dozen slides, evincing careful work with due appreciation of the artistic.

**North London.**—At a meeting on the 2nd inst., Mr. A. Mackie in the chair, Mr. J. Traill Taylor, President of the Association, gave his second lecture on "Stereoscopic Photography." The lecturer entered very fully into the history and construction of the various forms of the stereoscope from the earliest times, and exhibited several specimens of the instrument, both of foreign and English make, pointing out what he considered the advantages of each particular form. He described very minutely several stereoscopes which were now obsolete, one or two of which he said were so unique that he only knew of one specimen of the kind ever being made. The lecturer also brought with him a large collection of stereoscopic slides, each slide being illustrative of some principle or some defect which he wished to bring before the members. He also exhibited a new hand-camera of French make, which is being brought out, and which can be used for single views, and by a very ingenious sliding arrangement can be quickly altered so as to take stereoscopic pictures. Mr. Taylor entered very fully into the optical arrangements of the stereoscope, the mounting of the stereoscopic pictures, and the methods of taking such pictures both in a single lens camera, and also by means of two lenses. Mr. Coventon had brought with him a Latimer Clark's Stereoscopic Camera, and the construction and method of working this camera were fully explained by the lecturer. The lecture was highly appreciated by the members present, and a hearty vote of thanks was duly accorded to Mr. Taylor. Tuesday evening, June 16th, is a technical evening, when Mr. J. G. Hudson will most probably exhibit his new patent time exposure magnesium lamp.

**North Middlesex.**—On the 6th inst. a few of the members took part in the field-day to West Hampstead and district. On Monday the 8th inst., Mr. H. Walker in the chair, Mr. J. Traill Taylor addressed the Society on "Faults in the Composition of Photographs." Mr. Taylor dwelt upon the faults to which the photographer is most prone, showing numerous prints illustrating his points, and showing how by reducing the expanse of uninteresting foreground many

an unsatisfactory view might be transformed into a picture. He pointed out that repeated straight lines and geometrical arrangements were wearisome to the eye. Touching upon portraiture, the lecturer dealt with the arrangement of single figures and groups, advising his hearers not to yield to the pressure of their lady friends to make the details of the dresses the principal attraction, but to throw central interest upon the face. Three members were elected and two nominated. On Monday, the 22nd inst., Mr. F. L. Pither will read a paper on "Art in Landscape;" visitors welcome.

**Putney.**—The first monthly summer meeting for the election of new members, and discussion of subjects of interest was held on the 3rd inst., the Rev. L. Macdonald in the chair. The following were elected as members:—Messrs. Brothers, Handcock, Searle, Trenchgrouse, and Miss Parsons. Dr. Sheppard was elected to fill the vacancy on the Council caused by the unavoidable resignation of Mr. Manifold. Next excursion, Saturday, 13th inst., Burnham Beeches. Saturday, June 27th, excursion to Chislehurst.

**Richmond.**—At the meeting on the 5th inst. Mr. Cembrano presided. A demonstration of toning Celerotype paper was given by Mr. Blackie, of the Blackfriars Sensitising Company, who also showed some very fine finished prints, and distributed samples of the paper amongst the members present. The Chairman showed some beautiful transparencies of the Alcazar of Seville and the Alhambra.

**Rotherham.**—At the usual monthly meeting held on the 2nd inst., Dr. Baldwin (President) in the chair, an interesting discussion on "Dry Plate Development" took place, and from the opinions expressed it was apparent that pyrogallol acid was the most generally preferred for ordinary work. On a recent occasion five members exposed plates (all from one packet) under precisely similar conditions as to subject, aperture of lens, light, and time, and these had been developed by means of (1) pyro and ammonia, (2) pyro and carb. soda, (3) hydroquinone, (4) eikonogen, and (5) ferrous oxalate. The day selected proved most unfavourable, but the experience gained was very instructive. Mr. W. H. Smith resigned his position as Hon. Secretary, in consequence of his contemplated removal to another town. He was warmly thanked for his past efforts to further the interests of the Society, which now has a membership of thirty-four. Mr. H. C. Hemmingway, of 6, Stanley Street, Rotherham, kindly undertook to fill the office *pro tem*.

**Sheffield.**—The ordinary meeting was held on the 2nd inst., Mr. B. J. Taylor in the chair. Arrangements were made for an excursion to Lincoln for June 18th. The President gave a practical demonstration on "Toning and Fixing Gelatine Chloride Emulsion Paper." Mr. T. G. Hibbert demonstrated with the ordinary albumenised paper, which was very instructive to the large number of young members present. Mr. Hibbert brought before the meeting an interior printed on Obernetter paper, which was very much admired.

**Southport Social.**—The first exhibition of pictures in connection with the above was held on the 3rd inst. Mr. Kay, of 211, Lord St., very kindly acted as judge. The prize for instantaneous work was awarded to Miss Wall, with a neat little "Kodak" street scene in Cairo. Miss Dunmore obtained the prize for the best decorative window transparency, and also the prize for the best exhibit with a nicely selected view taken at the Botanic Gardens. There was a large number of pictures and transparencies for competition, and the members are to be complimented on their work. Mr. Cross exhibited some very effective portraits showing the great taste he has acquired for posing. Mr. Dunmore also exhibited a large carbon print of Salisbury Cathedral, which is considered to be one of the most successful ever taken of this fine specimen of architecture. Mr. Cave and Mr. Franks had on view some first-class requisites in the photographic line, including some of the latest novelties. The whole affair passed off in a very satisfactory manner. Another exhibit on a larger scale is arranged to take place in October.

**Wolverhampton.**—At the monthly meeting of this Society, held on the 2nd inst., Mr. Middleton, of the Birmingham Society, delivered a most instructive and interesting lecture on "Photo-Mechanical Printing Processes." In his opening remarks, he stated that being a large subject, and the method complicated and full of details, there would be some difficulty in making the various processes sufficiently clear to a novice in the art, and that the better way would be to give a general idea of the work, rather than a detailed description. The key to photo-mechanical processes was the action of light upon bichromate of potash, and by this means Fox Talbot patented his photogravure process in 1853, although closely followed by Woodbury, who obtained the same results in a different way. Woodbury-type, photo-litho, photogravure, Meisenbach, colotype, electrotpe, etc., were most clearly explained, and various questions arising from the different subjects were ably answered by the lecturer. The tables were well filled with specimens of plates, blocks, and finished work illustrating the whole of the processes described. These were examined with much interest by the unusually large number of members and friends present. Mr. Gibson had on view a fine collection of lenses by Taylor, Taylor, and Hobson, of Leicester; also a sample of the Blair camera.

## Apparatus.

### SHENSTONE'S FOCUSING CLOTH CLIP.

MESSRS. HOUGHTON AND SON, of 89, High Holborn, have sent us a specimen of this clip, which is intended to be placed within a hem at the edge of the focussing cloth, and so holds the front tightly to the camera. The clip is hinged so that it folds up into small space. The clip is ingenious, and the price is 3s. 6d.

### AUTOMATIC SUCKER HANDLE.

Mr. Tylar, of 57, High Street, Aston, Birmingham, has sent us another of his ingenious novelties, which is intended to take the place of the more pretentious pneumatic holders for the cutting shape. As will be seen from the cut, it consists of a wooden handle at the end of which is an indiarubber cup, which is wetted and then pressed to the centre of the cutting shape, which it holds securely. The price is only ninepence, and it will be found a boon by those who have suffered from the slipping of the glass.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

**4752. North Wales Tour.**—Contemplate doing North Wales end of July for fortnight, taking in Chester, Rhyl, Vales of Llangollen and Clwyd, Llandudno, Bangor, Carnarvon, Bedd Gelert, Bettws-y-Coed, Aberglaslyn, through down to Abergystwyth. Would feel obliged by any information about the best views at these places, also as to suitable hotels, as well as any other information which would be useful. Would like to hear from brother amateur, who could join me in the tour.—**GARSTON.**

**4753. Green Colour on Negatives.**—Can any reader tell me the cause of the green colour at the back of some negatives after fixing?—**H. M. D.**

**4754. Spots and Faded Prints.**—Will carbolic acid and methylated spirit in mountant spot or fade prints?—**H. M. D.**

**4755. Early Morning Photography.**—Could any fellow-reader tell me if Lancaster's quarter-plate Instantograph lens gives good results for views between 6 and 7 a.m. in London; if so, what stop and exposure is best? Also any particular plate?—**W. F.**

**4756. Bettws-y-Coed.**—I propose spending a fortnight in North Wales shortly, and should be glad to learn through the **AMATEUR PHOTOGRAPHER** any places of interest round Bettws-y-Coed, and any assistance as to light. I have one of Ross' rapid symmetrical lenses. What exposure should I give with Ilford's ordinary and Fry's Kingston Special 60 times? I shall bring home to develop. Could I have better dry plates than these?—**D. G. H.**

**4758. Printing.**—Where can I get printing from my negatives done at a moderate price? Most photographers ask a ridiculously high rate.—**H. G. S.**

**4757. Developer.**—I have hitherto used Ilford plates, and confined myself to the formula given with each box of plates. Can I do better? There

are formulae sold similar, but ready mixed; this would save much trouble if they answer as well. I suppose this formula would not suit other makes of plates so well?—**D. G. H.**

**4753. Half Plate Camera.**—I wish to buy a half-plate camera with three dark-slides and drop shutter, stand, etc. Will someone advise me? I am willing to go to the extent of £10 or £12.—**H. G. S.**

**4760. Distilled Water.**—Will someone kindly give a good substitute for distilled water? Would rain water, boiled and strained through muslin, answer? Any information on this subject I shall esteem a great favour.—**COUNTRY COUSEN.**

**4761. Hintokinone.**—Can any of your readers give me advice as to the use of hintokinone as a developer?—**C. E. F.**

**4762. Alum, Before or After Fixing.**—Could any readers of the **AMATEUR PHOTOGRAPHER** inform me if it would improve my negatives, which are developed with Lockyer's hydroquinone developer, by using a clearing solution or alum bath before or after fixing the negatives? A reply will oblige.—**W. H. ELLIS.**

**4763. Masks and Discs.**—Can any reader kindly inform me how a bust is vignetted on a cabinet size without any background? I mean head and shoulders only.—**J. O. M.**

**4764. Toning.**—Having two lots of sensitised paper by two London makers, I wish to know whether Mr. Ellis's toning bath, in the reply 4722, will answer for any papers? I should be glad to know the cause of my films coming off after developing. I always use the alum bath.—**JOHN BOUGHREY.**

**4765. Rochester and Chatham.**—I shall be spending a few days in this neighbourhood shortly, and shall be obliged to anyone who will be good enough to mention places of photographic interest.—**ANON.**

**4766. Blacking Slides.**—I want to re-blacken my metal dark-slides, as the japan black scales off. Will anyone, therefore, please give me a formula for chemically blacking tin plate and sheet iron? Nitrate of copper, as used for brasswork, will not do.—**A. D. F.**

**4767. Orthochromatic Colour Screens.**—Will any reader please tell me where I can obtain a small quantity of aurantia, or give me the name of some orange or yellow dye, easily obtainable, and equally suitable for staining collodion colour screens for orthochromatic work? The dye must be soluble in alcohol and ether.—**A. D. F.**

**4768. Eikonogen Formula.**—Wanted, an eikonogen formula for Ilford alpha and bromide papers.—**A. D. F.**

**4769. Reproduction.**—Is there any easy and cheap process by which I can reproduce photographs (either reduced or enlarged) so as to print or copy them on ordinary paper, after the style of photo-zinc half-tone blocks? If there is, can any reader oblige me with the process?—**SELRAHC.**

**4770. Enlarging.**—I have a capital quarter-plate French camera with R.R. lens. Can I make daylight enlargements with this on bromide paper? If so, will some brother amateur kindly tell me how to go about it?—**SELRAHC.**

**4771. Lantern Slides.**—I have lately made some very fair slides on Thomas's lantern plates, but find, after fixing, a faint green film on the back of plate (except the transparent portions, such as sky, etc., which are perfectly clear). Can someone kindly tell me how to avoid this in future, and whether I can remove it from plates already made?—**SELRAHC.**

**4772. Blisters.**—Can any reader tell me how to prevent my prints from blistering? I use the borax bath for toning, and make the hypo slightly alkaline with ammonium hydrate, both baths being of the usual strength. The blisters appear as soon as

**Wood's Washer.**—Mr. James Wood writes us that he has disposed of his rights in his washer, which has deservedly gained such success, to Wood's Washer Company, 25, Cumberland Street, Liverpool. We understand that the sales have increased 100 per cent. this season.

**Dark-Room for Amateur Photographers in London.**—Messrs. Parker and Co., of 288, High Holborn, have fitted up a large dark-room for the sole use of amateurs, which has no connection with their business; a very moderate charge is made for the use of it, and many will, we feel sure, find a dark-room in such a central position very useful.

**Swinden and Earp's Camera.**—We have just heard from Messrs. Swinden and Earp, 21, Islington, Liverpool, that they have arranged to supply sheaths for their cameras, and that the operator can, at will, either put his plates in sheaths or use them backed. The charge for a set of sheaths is 2s. 6d.

**Correction.**—Mr. W. H. Ellis writes:—"I should be much obliged if you could correct the error in last week's **AMATEUR PHOTOGRAPHER** (5th June, 1891), in my answer to Query No. 4722, Toning Bath, p. 416, middle column. The end of the answer should read, 'N.B. Untoned prints fade,' instead of 'Re Untoned Prints Fad,' as it appears."

I commence to wash the prints after fixing. I use tap water, which contains the carbonates of calcium and magnesium.—**SCRIBO.**

**4773. Instantaneous Work.**—I wish to take views of ships with the Instantograph half-plate, using its shutter, but am in doubt as to the best plate to use. I should be glad if some reader would kindly give me some help. I use the Ilford plates for ordinary work.—**SCRIBO.**

**4774. Exposure.**—Is there any reliable table of exposures extant which will help a beginner? I have Burton's, Wheeler's, and Vie's, but each one is different. For example—Vie tells me that, using f/32 stop, 30 times plate, diffused light, for open landscape with strong foreground, as trees, or light buildings, I must, in April or August, at 3 p.m., give an exposure of 2½ secs. Wheeler says 1½ ms that under precisely the same circumstances and conditions I must give 6 secs. Burton says 4 secs. Which is correct? Advice will be gratefully welcomed by—**A PUZZLED NOVICE.**

## QUERIES UNANSWERED.

May 29.—Nos. 4711, 4723.

June 6.—Nos. 4727, 4729, 4732, 4733, 4737, 4738, 4740, 4746, 4749, 4750, 4751.

## ANSWERS.

**4709. Central Africa.**—I believe Carbutt's films keep well in hot climates, and as fluid developers and also chemicals, might deteriorate in so hot a climate, I should say pellet developers in bottles would be the best. Cyanotype paper would be most convenient, but it does not keep, so perhaps Pizzighelli platinum paper would suit, only needing a wash in dilute hydrochloric acid.—**PONTO.**

**4709. Central Africa.**—(1) Depends upon whether you have a roll-holder or not; if you have, then Eastman's is if you can get it; if not, Carbutt's. Eastman's sell the Kodaks, but are unable to supply a roll of the collodion film. (2) I should think Powell's developers would be the most convenient form and one of the fixed alkalis in the dry state; for instance, the dried or exsiccated carbonate of soda. (3) This will be the greatest trouble. Ordinary albumen paper in sealed tin tubes.—**E. UNUM.**

**4712. Retouching.**—Pencil will not take on the film. The usual way is to put one or two drops of the medium on the negative, and distribute with the forefinger tip, rubbing in circles till nearly dry.—**OSIRIS.**

**4715. Optical Contact.**—Take 1 oz. of gelatine and soak in cold water until soft, and add 10 oz. of boiling water. When quite dissolved, place a glass or porcelain dish in a vessel of hot water, about 100 deg. Fahr. in temperature, and filter the solution into this through a piece of muslin. Then, having previously cleaned your glass plates, immerse a print in the gelatine and leave till soaked, place it upon the glass plate, and squeeze. When dry, trim the edges with a knife. It is best to vignette a border of about ¼ in. all round. The glass plates, bevelled, with backs, may be purchased at about 2s. doz., ¼ plate size.—**PONTO.**

**4716. Reducing.**—This question can be fully answered from almost any handbook. This reduction from half plate to 3¼ is one half, therefore the distances are 2½ in. between lens and negative, and 12½ in. between lens and lantern plate.—**OSIRIS.**

**4716. Reducing.**—If you wish to include the whole of your half-plate negative on the slide and show a rectangular picture, the distance from the negative to the optical centre (roughly, the diaphragm) of the 8½ in. lens will be 25½ in., and from

the lens to the lantern plate  $12\frac{1}{2}$  in. If you want a square picture, and to include as much as possible of the negative, then the distances will be  $20\frac{1}{2}$  and  $14\frac{1}{2}$  respectively.—THE SMITH.

4717. **Switzerland.**—The following may perhaps help "I. I. S." The latitude of London is approximately 52 deg., that of Brunnen 47 deg.; the unit which expresses the chemical action of light for 50 degs. is 432 for June and 408 for July. The unit for 40 degs. for June is 469, for July 452. As there is only 5 deg. difference between Brunnen and London, the difference in exposure will not be great in this respect, but as the elevation above sea level has considerable influence on the amount of chemical rays absorbed by the air, this should also be taken into account. The difference between the chemical intensity of light at 53 deg. and 49 deg. (327 units for the former and 373 for the latter) is 46; we may therefore conclude that, taking the purer and clearer air of Brunnen into consideration, and its probable greater elevation, one quarter or one third less exposure would be sufficient. One or two trials, however, would very soon establish, and one should also take into consideration the character of the view. One or two trials with Wormald's table as units would give more information, however, than all theory.—OSIRIS.

4718. **Wide-Angle Lens.**—"Phim." A Ross portable symmetrical No. 4, about 6 in. focus, covers a  $7\frac{1}{2}$  by 5 perfectly and with marvellous definition. At very close quarters I have used it successfully with a 12 by 10 plate.—GREENWOOD.

4721. **Instantograph Lens.**—You have not pulled the bellows forward towards lens, as you must do when using rising front. Your plate is not covered because a fold of bellows has cut off a portion of the light. My lens is a Rectigraph, but I had the same difficulty till I found out the above.—F. P.

4726. **Exposure.**—Conditions are too vague. It depends upon weather, time of year and day, plate, and aperture, which "medium stop" does not describe very well. Get an exposure table; there is a good one on Thomas's plate boxes.—PONTRO.

4726. **Exposure.**—The exposure with the lens named would be exactly the same with every other lens working at the same aperture, and this would be dependent on the light, rapidity of plate, distance of group, etc.—OSIRIS.

4728. **Wide-Angle Lens.**—The Optimus W. A. Euryscope of 6 in. focus would include an angle of about 80 degs. on a  $7\frac{1}{2}$  by 5 plate, which would be wide enough and to spare if artistic results are considered. I would not recommend a shorter focus.—THE SMITH.

4728. **Wide-Angle Lens.**—Either Perken and Raymond's W. A. Euryscope or their portable symmetrical 7 by 5 would suit "Phim." The Euryscope is quicker than the other, working at  $f/9.50$ . They both give quite a wide enough angle for anything. The prices are: Euryscope, £2 14s. 6d.; W. A. symmetrical, £2 12s. 6d.—PHENIX.

4730. **Mounts.**—Edwin Osborne, 26, Red Lion Square, London, W.C., will supply what you require.—PEN.

4730. **Mounts.**—"H. I. O." had better get Fallowfield's "Annual," and there he will see all kinds of mounts, all sizes, colours, and prices. The address is Charing Cross Road, W.C.—P. R. S.

4731. **Retouching.**—Coat the back of the negative with a very pale yellow tinted varnish, and when dry, remove it with a knife from the parts that are too dense. Print in diffused light.—THE SMITH.

4733. **Intensifying.**—Your chemists must be odd people. I can get bichloride of mercury anywhere by stating that the purpose is photography and signing poisons book. I use it often and I am still alive. Keep it locked up, don't dabble your fingers in it, wash your dishes and the plates well, and you will not run the smallest risk.—F. P.

4733. **Intensifying.**—The solution you mention is quite safe unless you pour it down your throat or get it into sore places on your hands. Write to your photographic dealer for the mercury; if every one else fails, Reynolds and Branson, 14, Commercial Street, Leeds, will send an ounce without questions if you write to them. You can raise the plate out of the solution by putting a piece of string underneath.—PEN.

4733. **Intensifying.**—You are quite right about the dangerous qualities of bichloride of mercury, and as it is included in the list under the "Poisons Act," a chemist will not sell it unless you have a witness to sign in a book kept for the purpose. If you do not wish to have the chemical about you, you will simply have to take more care in development, as there is nothing else less poisonous to take its place.—THE SMITH.

4733. **Intensifying.**—Doubtless bichloride of mercury is a dangerous inward poison, but it is safe enough if made in solution and kept in a stoppered bottle. Of course, a strong solution will do harm outwardly. Make a solution as follows:

Mercuric bichloride ... ..  $\frac{1}{2}$  oz.  
Water ... .. 5 "  
and be careful.—J. C. M.

4733. **Intensifying.**—It is a poisonous solution, certainly, but not so terrible as you make out unless you are very careless. I have intensified numerous negatives with it, and am yet alive to tell the tale. I am not a great admirer of this intensifier, and as

you don't seem to want to use mercury you had better invest in a bottle of the Platinotype Company's Perfect intensifier, which works well, provided that you keep the dish rocking all the time. I should think it was practically quite harmless in ordinary use.—R. A. R. BENNETT.

4733. **Intensifying.**—My chemist always allows me to have the solution you name, but I always sign my name in a book, stating for what purpose it is intended, and I have no trouble. If I were you I would try this: Uranium nitrate, 10 gr.; water, 1 oz. Place your negative into this for about three minutes (of course the negative must be thoroughly washed beforehand). After draining the plate, but without washing, immerse in a solution of potassium ferricyanide of the same strength. It will soon change colour; it should be lifted out once or twice so that the change may be seen and not allowed to go too far. A thorough washing must follow.—P. R. S.

4733. **Intensifying.**—Most of the ordinary intensifying formulae contain mercury, either iodide or chloride. No doubt the latter is very poisonous, but that a drop of 10 per cent. solution would prove fatal is gross exaggeration. The smallest fatal dose is usually given as three grains of the solid salt, which would represent about half a drachm or more of the solution given by W. H. B. But one does not usually drink or taste one's photographic chemicals. Many others—such as pyro—are also poisonous, so that care must be used with all such, especially not keeping solutions near anything that is used to drink. There are various formulae for intensifying with silver nitrate—also a poison, by the way—but they are very difficult to use without staining the negative. As to trouble about obtaining mercuric chloride, photographic dealers are not usually so particular as the chemist mentioned in the question.—GREENWOOD.

4733. **Intensifying.**—I do not see how one drop of bichloride of mercury solution could be so deadly as to prevent Mr. Ellis from using it. Surely thousands have used this method of intensification and have still been alive the next day. Get your chemicals from a photographic dealer and you will have no bother. Mr. J. B. B. Wellington recommends the following formula:

I.  
Silver nitrate ... ..  $1\frac{1}{2}$  oz.  
Water ... .. 18 "

II.  
Ammonium sulphocyanide ... .. 3 oz.  
Sodium hyposulphite ... .. 3 "  
Water ... .. 18 "

Take equal parts of each, adding II. to I. until the precipitate is just dissolved. To each ounce of this add 3 minims of sulpho-pyrogallol and 6 minims of ammonia. Afterwards place negative in hypo and wash. Full details of this formula may be found on page 70 of "Amateur Photographers' Annual," a book which every photographer ought to possess.—PHENIX.

4734. **Films, Exposure for in Norway.**—Films are much more convenient than plates, as very little luggage can be carried in Norway. Fry's "60 times" are excellent and not so fast as the title suggests. Get them fresh from the maker. Subjects vary so much that it is difficult to give an "average" exposure, but the light is more actinic than in England. "Instow" should be prepared for much trouble in changing, and take as many slides as possible, also plenty of red paper.—K. GRIFFITH.

4739. **Gold Chloride.**—Dissolve in 15 dr. of distilled water and you have a solution of 1 gr. to 1 dr. which will keep indefinitely.—THE SMITH.

4739. **Gold Chloride.**—Dissolve 15 gr. in 15 dr. of water; you have then 1 gr. in each drachm of water. This in the dark will keep for months.—GREENWOOD.

4739. **Gold Chloride.**—I usually dissolve a tube of 15 gr. chloride of gold in 15 dr. of distilled water; put it into a blue bottle so that the light shall not get to it, and label it 1 gr. of gold to each drachm. I believe in this state; it will keep a year or even more.—H. I. C.

4739. **Gold Chloride.**—Your best plan to dissolve your tube of gold is to do it in 15 dr. of water, and then when you want a grain of gold you can take a drachm of water. This is what I always do. I have some now that I made nine months ago, and it is as good as ever. It must be kept in the dark.—P. R. S.

4739. **Gold Chloride.**—Dissolve your tube of gold in 15 dr. water. You will then have a solution of gold chloride 1 gr. in 1 dr. If the water is pure (filtered rain or distilled preferable), and you keep out the label on tube, broken glass, etc., i.e., filter, and do not expose to a strong light, the solution will keep for months.—PEN.

4739. **Gold Chloride.**—A very vague query, since it depends entirely on what you wish the strength of the resulting solution to be! Either dissolve the contents of the tube in 15 dr. of water or 15 oz. of water, according to whether you want a grain of chloride to a drachm or an ounce of water. It will keep any time if you make the bottle opaque by covering it with brown paper or painting it with black paint, for which I use a rather stiff mixture of lamp black and gold size.—R. A. R. BENNETT.

4741. **Matt-Surface Paper.**—Get Scholz's matt-surface paper print very deep, wash in only one

water, and for as short a time as possible. Use an old borax bath and do not add fresh gold if it has been lately revived. If you make up a fresh bath, let it be weak in gold— $\frac{1}{2}$  gr. to 10 oz. of water is enough. For brown tones (see p. 121 "Amateur Photographers' Annual," which every amateur ought to possess). Use the following:

Stock Solution:  
Borax ... .. 330 gr.  
Acetate of soda ... .. 180 "  
Bicarbonate of soda ... .. 90 "  
Water ... .. 20 oz.

Bath:  
Stock solution ... .. 10 dr.  
Gold ... .. 1 gr.  
Water ... .. 10 oz.

Use two hours after mixing. Fix in weak hypo bath for twenty-five minutes.—PHENIX.

4742. **Copying.**—Arrange the photograph to be copied so that an oblique light falls on it; then place a mirror so as to throw the light in the reverse direction. The shadows cast by the grain in the paper will thus neutralise each other.—GREENWOOD.

4743. **Good Half-Plate Lens.**—You could, I think, get a good half-plate rapid rectilinear lens which would suit your purpose from Mr. A. Brooker, 52A, Robertson Street, Hastings, on the terms you mention (payment by instalments).—PEN.

4744. **Wiesbaden.**—You will be at liberty to take photographs wherever you like. The scenery is exceptionally picturesque; do not miss the Nersberg and the Russian (Elizabeth) Chapel. Very likely you will be able to get English plates; should you have any difficulty about it, write to any of the best houses in Frankfurt-on-Main, which is but forty miles away. You will have no trouble with the customs if you put the usual labels on the dry plate boxes. Do not attempt to tip any official.—NOXALL.

4745. **Bromide Printing.**—Give a shorter exposure to the paper and, if you are using the iron developer, reduce the proportion of oxalate of potass.—THE SMITH.

4745. **Bromide Printing.**—I would imagine that "Coptic's" prints are over-exposed, and that the high lights begin to discolour before the shadows have had time to gain density. Are the solutions saturated, assuming he uses ferrous oxalate? and is he using enough iron?—GREENWOOD.

4745. **Bromide Printing.**—I think "Coptic" could not have gone through the process quite correctly; he either under-exposed or under-developed the print to start with, or the print was not in the water quite long enough after developing; the print was too long in the fixing bath, or he did not let the print remain in water for at least ten minutes after taking the print out of the fixing bath, or he blotted the print with blotting paper. Never blot the bromide prints with blotting paper; always let them dry themselves by laying them on something flat. Any of these faults will do something towards getting a bad coloured print when finished.—W. H. ELLIS.

4747. **Photographs Wanted.**—In answer to "O. F. Yonge's" enquiry I beg to say my garden adjoins the churchyard at Heckington, Lincs. I am only a beginner at photography, but should be glad to do my best and send a photograph of the recess in the channel, formerly used as the Easter sepulchre. Would "O. F. Y." kindly write to me direct and I will do my best to help him.—D. G. HARRIS, St. Andrew's Villa, Heckington, S. O., Lincolnshire.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

A. B.—(1) Fully exposed, and rather under-developed. (2) Over-exposed. (3) Over-exposed. (4) Correctly done. (5) Slightly under-exposed. (6) Over-exposed. (7) Slightly under-exposed. (8) Correctly exposed. (9) Under-exposed. (10) Under-exposed. Most of your negatives would stand further developing. You do not allow for the fact that the colour of the deposit is not so non-actinic as that of pyro.

H. F. FAY.—(9) Under-developed. You might cut off 2 in. of foreground, and 2 in. from right hand. (10) Under-exposed; too much top light. (11) Over-exposed and over-developed. You had better sun your river, so as to reduce its whiteness. (12) Very fair indeed. (13) Lighting very poor.

J. H. W.—(1) Good; only wants a little life in it, a few pigeons, cocks, and hens. (2) Spoilt by the figure. (3) Good. (4) The best. (5) Excellent. These last three are very good. The technical work is good. You ought to stand a chance in some of our competitions.

BEE.—Yes, part of the roof should be glazed as much as you can spare, and one side should be entirely closed in.

H. M. D.—We have sent your reply to Miss C. F. Yonge.

Mrs. CLEASBY.—The medal was sent off as advised. We have no doubt it reached Penoyre.

CHAS. FULLBROOK.—The formula will be found in the *AMATEUR PHOTOGRAPHER* of Sept. 28th, 1888.

L. R.—You will find the finders made by Taylor, Taylor, and Hobson, to be had of any dealers, the best, and they will supply you with the right size for 7½ by 5.

G. F. DIETRICH.—Send your complaint to the Photographic Dealers and Manufacturers' Association, 7, Southampton Row, W.C.

A. C. H.—We should be greatly obliged if you would send us an article, "Holiday Resort," on "The Valley of the Wye." Shall be pleased to see you when you are in town. Always "At Home" Monday afternoon.

ARTHUR JANE.—Very many thanks for article on "Bodmin and Neighbourhood," which we shall use shortly.

ASPIRANT.—(1) The formula may possibly be published in a future issue of the *Camera Club Journal*, but we are not in possession of it. (2) Many have done good work with the plates you name. If you do change, try the Paget. (3) The lens you name will do very good work, and, for the price, is an admirable instrument.

A. B. EDWARDS.—Certainly; hope you will enter both competitions. You will have received "Photography at Home" entry form.

H. F. LINGING.—Pressure of work has prevented us from testing your paper, but we hope to do so this week.

BOSTON.—All your negatives are fogged in developing, either from the light or from using too much accelerator. (1) A well chosen bit, and would have made a picture had your figures been fishing. (2) A little too much uninteresting foreground; this negative shows unequal patches in consequence of the developer not covering the plate evenly. (3) Your camera was not level, and, consequently, the weir is all on the slant; again, your figures should be doing something beside staring into the camera. If you like to expose a couple of plates we will develop them for you, to show you what a well developed negative should be.

DOCTOR.—(1) This negative is not sufficiently developed and the developer did not flow evenly over the plate; the print is flat and over-toned, the black spots on the back are due to iron or pyro. (2) Negative good; we cannot approve of the cotton-wool clouds. (3) Negative under-developed and print, consequently, flat. (4) Very poor. (5, 6, 7, 8) All these prints are under-printed and over-toned. To avoid getting the sky so dense it is advisable to commence development with about one-tenth of a grain of pyro to the ounce, then, when all detail is out, add more pyro and bromide.

YOUNGSTER.—(1) A good retouching medium may be made by dissolving:

Gum dammar	...	...	10 gr.
Canada balsam	...	...	5 "
Turpentine...	...	...	1 oz.

Drop a drop or two on to the negatives and rub in circles with the tip of the forefinger till nearly dry, then leave for half an hour to dry thoroughly. (2) You are over-exposed and have obtained reversal of the image; give a shorter exposure. (3) The exposure for the Paget xxxxx. would be practically the same; we should prefer the above-named plates. (4) Over-exposure is again the cause of your reversed images, unless you are using a drop or two of hypo as an accelerator. (5) No, you cannot intensify a silver print.

W. BRANSON.—(1) Over-exposed; at least 1½ in. off foreground would improve it. (2) Over-exposed; we should have thought about half to one-third of the exposures you gave quite sufficient. Never soak your plate in water first, and use less ammonia to start with. The larger the stop and the shorter the exposure within reasonable limits the more brilliant the picture. Try again and let us see some more results.

B. T. ROBINSON.—Negatives: (1) Frantically over-exposed. (2) Ditto; when you want to dry negatives quickly place them in methylated spirit for ten minutes and then in a good current of air; don't dry before the fire, especially negatives developed with hydroquinone. Prints: (1) Good. (2) Good. (3) Under-printed, and a little sharper focussing in the foreground would improve it.

SNOWD.—

Hydroquinone	...	...	90 gr.
Sodium sulphite	...	...	2 oz.
Carbonate of soda...	...	...	2 "
Bosin...	...	...	1 gr.
Distilled water, to make	...	...	10 oz.

Dilute with four times the quantity of water for normal and six times the quantity for over-exposure.

A. T. WEBB.—Use stop marked 18. The numbers refer to the ratio aperture of the diaphragms and relative time of exposures.

AMATEUR PROFESSIONAL.—Thank you very much for MS. (1) The method you propose for washing prints is certainly the best for freeing prints from hypo. (2) The lenses named are not English make and it's a question of luck as to getting a good one.

LLEWON.—You say you were afraid of dull weather

and yet took a slow plate with you. Had you taken the xxxxx. plate you might have got good results. If you have still some undeveloped plates send us up half a dozen.

REX.—We should be perfectly satisfied from the print you send that the lens which was used could turn out good work.

H. I. C.—We think it is due to some fault in your manipulation. Please let us know exactly how you developed it.

F. READ.—(1) Out of focus and badly developed. (2) Over-exposed and wrongly developed. (3) Out of focus, under-exposed, and badly developed. (4) Out of focus, under-exposed. (5) Under-exposed. (6) Under-exposed, badly developed, unequally toned, and print stained with pyro. You ought to do better than this. Let us know what apparatus and plates you are using and send us up a couple of exposed plates with full particulars, and we will develop, print, tone, and return you.

H. F. LINGING.—(1) Exposure about 1 sec. with the sun, 4 secs. at 5 p.m., 2 secs. on a dull day. (2) About ½ sec., 1 sec., and ½ sec. The relative exposure would be for f/22 = 1 sec and f/32 = 2 sec.

J. B.—See next week's issue.

CHAS. H. MEDLOCK.—(1) The usual method to remove iridescent stains is that suggested by Abney: soak the plate in

Ferric chloride	...	...	50 gr.
Potassium bromide	...	...	40 "
Distilled water	...	...	4 oz.

for two or three minutes, wash well and redevelop with ferrous oxalate, then refix in hypo. (2) You might try treating the ferrotype with the following:—

Mercury bichloride	...	...	10 gr.
Distilled water	...	...	1 oz.
Methylated spirits	...	...	4 "

when the image will probably show up a little more, then wash and allow to dry. We are glad you find our paper useful, and shall be pleased to help you at any time and criticise prints for you.

W. T. BARTON.—The negative is certainly fully exposed; we should strongly recommend you to try a thicker coated plate. Thirty minims of pyro ought to give you plenty of density, and good black negatives are not always the ones to give the best prints. The peculiar colour given by the developer you use is rather in your favour as giving far more harmonious results than a black and white negative.

S. ARMSTRONG.—(1) The speed necessary to take trains and race endings depends entirely upon the rate of motion of moving object, distance of same from the camera, and focus of lens. Let us know these three data, and we will help you further. (2) No, we believe there is no firm that lets out hand cameras on hire. Thank you for your offer, we may take advantage of your kindness presently.

OLINDA (Godalming).—We were unable to decipher your signature. The cause of your stained prints is probably due to not washing between toning and fixing. If you use carbonate of soda for making bath alkaline, use the same for the hypo. Provided you wash thoroughly and quickly, it is not necessary to use either salt or soda before toning, though either may be used. Salt is said to give a brown tone, soda a purple. It is not advisable to acidulate the bath, merely keep it, and use instead of water to dilute the new bath. Always pleased to help you.

R. E. J. T.—The plate was not in sharp focus; it seems to be developed all right. The print was not printed half deep enough; the hypo is about right strength, though you might add a little more ammonia without any harm. Blisters may be avoided by careful attention to the temperature of solutions, using salt to wash the prints in before and after toning, and keeping the prints face downwards in all solutions.

M. G. P.—(1) Certainly, the shutter is quite quick enough. (2) The exposure is the same as in England. (3) Powell's Tabloids would be a very convenient form, and merely require dissolving in water and the addition of a little sodium hydrate. Write to Powell direct, and ask him to send you a circular about his developers, &c.

CANTUAR.—We should prefer the B lens, because it is made of the new Jena glass and will therefore enable you to actually use a larger aperture compared with A. On the other hand, A is a first-class lens, and has the advantage, from its shorter focus, of having objects nearer to it in focus than B, but B would give more pleasing perspective. Probably some of the higher price is due to the name.

PERSEVERANCE.—We cannot criticise the photographs you have sent, if you intend entering them for the "Public Schools" competition, but by all means go in for it. Entry form is sent you.

JAMES WOOD.—Noted as requested. The man you mention was only a "make-believe editor," and must not be ranked with the noble army of martyrs.

REV. J. CHAPPEL.—We have written to you. The maker is thoroughly reliable, and the camera may be sent us for inspection before being sent on to you, should you give him an order.

L. MONSON.—Your letter is not published, as it throws no light upon the subject, "What is an Amateur?"

JAMES WOOD.—Have noticed, as requested.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the *AMATEUR PHOTOGRAPHER* will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the *AMATEUR PHOTOGRAPHER*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

"Amateur Photographer," etc.—*AMATEUR PHOTOGRAPHER*, vol. ii., bound, cloth, clean, cost 12s. 6d., free 4s. 6d.; vol. viii., unbound, clean, cost 4s. 6d., free 2s. 6d.; extra 1s. numbers taken part exchange.—Hedderwick, 41, Garsard Hill, Glasgow.

Backgrounds.—Backgrounds, canvas, on rollers, 6 ft. by 8 ft., 11s. 6d.; 7 ft. by 8 ft., 16s. 6d.; 8 ft. by 8 ft., 20s.—M. Mullen, 203, Camberwell New Road, London, S.E.

Bicycles.—Safety, bargain. Will accept £7 17s. 6d. for diamond-frame Safety, fitted with cushion tyres, ball bearings to all parts (including pedals), beautifully plated and enamelled, good make, perfect condition, new this year, no fault whatever, splendid machine; approval willingly; satisfaction certain.—T. E. W., 33, Alexandra Road, Ipswich.

Cameras, etc.—Half-plate camera, with all movements, best leather bellows, and three double-hinged dark-slides, also tripod and stand, all new, and the best of workmanship; price £5.—H. Atkinson, Boughton Heath, Chester.

Whole-plate camera, three slides, tripod stand (very strong), two fronts, in splendid order, almost new; £6 only; approval of Editor.—H. Holt, Conservative Club, Liverpool.

Lancaster's Merveilleux or Meritoire quarter-plate camera, cheap.—7, Linscott Road, Clapton.

Watson's 12 by 10 Premier camera, brass-bound, three double dark-slides, extra front, and sliding tripod, by same maker, all new a few months ago, hardly used, also a canvas background, 6 by 5; the lot for £18 4s.—P., 12, Sydney Road, Richmond.

Lancaster's quarter-plate Special camera and three double backs, brass-bound, long extension, reversing back, etc., perfect; sell for £2.—G. E. Franklin, Rickmansworth.

What offers for Lancaster's half-plate camera, with three double slides, instantaneous shutter, stand, and waterproof case? or would exchange for Safety bicycle.—Address, 90, Oxford Street, Manchester.

Lancaster's quarter-plate Instantograph, with patent adjustable diaphragms and instantaneous shutter, nearly new, with tripod stand, and two mahogany double slides; cost £3 10s.; price 30s.—No. 168, *AMATEUR PHOTOGRAPHER* office, 1, Creed Lane, London, E.C.

Cameras, Lenses, etc.—Lancaster's half-plate 1890 Instanto, four mahogany double slides, Albion rectilinear lens, waterproof bag, with lock, good as new; £6; approval; deposit.—Berry, Oxford Street, Stockton-on-Tees.

Quarter-plate Scliptoon Co.'s camera, rising and cross front, reversible swing-back, six double slides, alpenstock stand, lens, drop shutter, in solid patent leather case, cost over £6, will take £3; also new half-plate oak sliding stand, 10s. 6d.; half-plate landscape lens, 8s. 6d.—Riley, Stationer, Handsworth, Birmingham.

Whole-plate camera and lens; cost £3 three

months ago; will sell for 5 guineas.—May, 4, Rosina Street, South Hackney.

Quarter-plate box camera, with excellent portrait lens and double dark-slide, also single stereoscopic camera and lens (no dark-slide), by Stereoscopic Co.; 35s. the lot.—Barclay, Milton, Gillingham, Dorset.

Marion's enlarging apparatus, lens, special table, with sliding top and easel, quite perfect; cost over £10; best offer over £5.—Jones, Enfield House, Uffculme, Devon.

Half-plate 1891 Lancaster's Instantograph camera, dark-slide, tripod, f/8 R.R. lens; bargain, 72s.—53, Slad Road, Stroud.

Half-plate camera (Stereoscopic Co.), double extension, rising front, reversing and double swing-back, with four double backs, splendidly made, £5; Dallmeyer's triple achromatic lens, with stops, complete, in perfect condition, 40s. (list price £4 4s.); good exchange entertained.—J. T. Field, Montana, Blackheath, S.E.

Whole-plate Optimus wide-angle camera, latest improvements, new, one double slide, and sliding tripod, accept six guineas; whole-plate Taylor and Hobson's R.R. lens, Iris diaphragm, new price £3 19s.—6, Montford Place, Kennington Green.

Lancaster's 1891 special brass-bound quarter-plate Instantograph, three double backs, best lens, Iris diaphragm, See-Saw shutter in case, with lock, tripod, lamp, dishes, printing frames, plates, paper, etc., all quite new, complete outfit; £4.—Edwin Jewett, Matlock Bridge, Derbyshire.

Camera (Bilicoff), half-plate, three double cells, quarter carriers, landscape lens, and 3-fold tripod; £4 10s.; a bargain.—Roberts, jun., 37, Great Western Road, Glasgow.

7 by 5 Optimus wide-angle Euryscope lens, 72s.; half-plate brass-bound camera and one slide, long extension, and all movements, made to stand any climate, condition as new; 65s.—Amateur, 15, Bates Street, Steel Bank, Sheffield.

**Dark-Slides.**—Three half-plate walnut double dark-slides, so 10, good condition, each 6s. 6d., three 18s.; Kershaw shutter, 2 in. hood, blind, slightly damaged, 7s. 6d.—E. Winn, Uplands, Selly Hill, Birmingham.

**Hand-Cameras, etc.**—Quarter-plate Optimus mahogany brass-bound hand-camera, six double dark-slides, Taylor's detective lens, Iris diaphragm, also Optimus rapid view lens, can be used on a stand for focussing, two sunk view-finders, adjusted to focus of lens for vertical and horizontal pictures; cost £11; price £8.—Fred. Holmes, French Embassy, Albert Gate, London, S.W.

For sale, a bargain, stereoscopic hand-camera, built to special order, at a cost of considerably over £30, fitted with a pair of Dallmeyer's patent stereograph lenses, capable of working at f/4, Wollaston's patent diaphragmatic shutter, with revolving stops, facilities for using lenses as single (landscape) combinations, six double backs, with vulcanite slides, etc., etc.; price £15 cash; may be seen by appointment.—Address, E. R. Shipton, 140, Fleet Street, E.C.

No. 1 Kodak, cost £5 5s., first-class condition; price 60s., or offers requested.—Dr. Hodges, Park Road, Gloucester.

Magazine hand-camera, 12 quarter-plates, with Facile shutter and sunk finder, without lens; 16s.

or good exchange.—J. T. Field, Montana, Blackheath, S.E.

5 by 4 hand-camera, with rack and pinion, two finders, six Blair's feather-weight double backs, no lens, £3; Instantograph quarter-plate, with Ross' lens, £1 10s.—No. 169, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

**Lantern.**—Watson's £6 6s. optical lantern, as new; 80s.; approval.—Avery, 45, Park Street, Dorset Square, London.

**Lenses, etc.**—Lancaster's half-plate Instantograph lens, Iris diaphragm and shutter, folding tripod, brass top, one double back, vulcanite; cost £2 2s.; price 25s., or will sell separately.—Mark Smith, Louth, Lincolnshire.

A 9 by 7 Optimus rapid Euryscope, new and perfect; cost £6 6s.; take £4 10s.; approval; deposit.—W. B., 59, Freshney Street, Grimsby.

5 by 4 rapid rectilinear, Iris diaphragm; 23s. 6d.—G. Clough, 33, Magpie Road, Norwich.

Optimus 7 by 5 rectilinear lens and pneumatic shutter; 40s.—43, The Grove, Vauxhall.

Dallmeyer's No. 1AA wide-angle rectilinear lens; price £3 8s.; perfect condition.—J. H. Walker, 87, Union Terrace, York.

Half-plate rapid rectilinear lens, with Iris diaphragm, Hockin's Desideratum, nearly new; will take 30s.—Can be seen at the AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Splendid half-plate rapid rectilinear doublet lens, f/8, new; bargain, 21s. 6d.—John Slade, Slad Road, Stroud, Glos.

10 by 8 Optimus rectilinear lens, fitted with Newman's shutter and Waterhouse diaphragm, both nearly new; cost £7; cash £3 15s.—Reeves, 24, Harvard Road, Lewisham.

**Microscope.**—Excellent microscope, three powers, and accessories, in mahogany case; 45s.—Jones, Enfield House, Uffculme, Devon.

**Sets.**—Splendid whole-plate set, as good as new, Sands and Hunter's patent Imperial camera, extra-long focus, double patent swing reversing frame, with Ross' rapid symmetrical 10 by 8 lens, fitted with Thury and Amey's £3 10s. regulating shutter, the fastest and best shutter made, in leather case, complete with three double dark-slides; cost £27; sacrifice, bargain, £16 10s.; can be seen at address below.—Mitchell, Watson and Sons, 313, High Holborn, W.C.

**Sundries.**—Amateurs, have a good model. Send 1s. for six high-class negatives, by professional (deceased).—Richford, Wells, Norfolk.

Case, solid leather, lock and key, to hold 12 by 10 camera, 3 double dark-slides, lens, and tripod head, new, been used three times, first-class bag; 25s.—Henderson, 22, Montague Place, Russell Square.

Five pairs of pet rabbits; first reasonable cash offer gets them.—William Robinson, Castlederg, Tyrone.

**Tripod.**—Whole-plate tripod, mahogany top, very rigid; 13s. 6d.; cost 20s.—G. Clough, 33, Magpie Road, Norwich.

Alpenstock tripod, perfectly rigid, weight 1 lb., carry quarter or half plate, new; price 12s. 6d.—Hyde Parker, 77, Burton Road, Derby.

**Type,** 150 robber-faced, holder, pad, ink, etc., suitable naming negatives; approval; 7s. 6d., cheap.—Barton, Morrington, Elgin.

## WANTED.

**Cameras, etc.**—Lancaster's 1890 or 1891 pattern Instantograph quarter-plate, cheap.—H. Thompson, Brownlow House, Grantham.

**Dark-Slides.**—About three quarter-plate dark-slides, Tylar's preferred.—Webb, 65, Woodstock Road, Finsbury Park, N.

**Hand-Cameras, etc.**—First-class hand-camera, reasonable price; approval.—Chemist, 8, Strand, Torquay.

**Lenses, etc.**—A wide-angle rectilinear lens, half-plate, in exchange for new detective camera, cost 35s.—Firth, Oakleigh House, Wakefield.

Second-hand 10 by 8 R.R. lens, English, and 3 or 4-fold tripod for 10 by 8; exchange or sell half-plate photographic lens, with stops, 30s.—D. Harrold, 1, Valleyfield Street, Edinburgh.

**Sets.**—Lancaster's half international set, complete, without lens, cheap; cash.—Pridden, Jeweller, Weymouth.

Quarter-plate set, not more than 30s.; approval.—Particulars to Lynas, News Office, Redcar.

**Shutters.**—Furnell's shutter; give exchange Andersen's skylight and dark-room.—Valentine, Southampton.

Time and instantaneous shutter, to fit 7 by 5 Optimus Euryscope lens, also half-plate wide-angle lens.—T. O. Hosking, 1, Baldwin Crescent, Camberwell.

**Sundries.**—Luggage carrier (bicycle), quarter hand-camera, half tripod.—Edward Rouse, 3, Hethe, Bicester.

Good half-plate printing frames, in exchange for numbers of AMATEUR PHOTOGRAPHER, "English Mechanic," or "Carpenter and Builder."—Sutcliffe, 14, North Street, Burnley.

"Photographic Quarterly," No. 1; "Photographic Reporter," Nos. 1 and 2; state price.—Address, S. Armstrong, Enniscorthy, Ireland.

**Tripod.**—Walking-stick tripod; approval.—Particulars and price to Chemist, 8, Strand, Torquay.

**Views.**—Views, Cornwall; would purchase negatives (north coast) if suitable.—Bullmore, Newquay, Cornwall.

## A WANT SUPPLIED.

**THE 'SENSIBLE' FOCUSING CLOTH.**  
It protects Camera. It makes focussing easier. It does not flap about. It prevents fogging when dark slide is drawn out. The Camera can be folded up in it.

"It is the most perfect focussing cloth that could be conceived."—Amateur Photographer.

"We consider it an extremely useful article."—Photography.

1/4 Plate, 2s. 6d.; 1/2 Plate, 3s.; 1/1 Plate, 3s. 6d.

POSTAGE, 3d.

The Amateur Photographer's Ready Reckoner  
**EXPOSURE TABLES BY V.I.E.**

Improved Edition with Register for Exposures, 1s. 6d., post free 1s. 7d. They are the only tables which have the results fully worked out.

T. MANSON, 37, HIGHGATE, KENDAL,  
Or through any Photographic Dealer.

# BOOKS PUBLISHED AT THE OFFICE OF THE "AMATEUR PHOTOGRAPHER."

**DICTIONARY OF PHOTOGRAPHY.** By E. J. WALL. New and revised edition, 2s. 6d.

It contains more information on Photography than any book published.

**BOOK OF THE LANTERN.** By T. C. HEPWORTH, F.C.S. Third edition, 3s. 6d.

The only book published that gives complete instructions as to how to make lantern slides, purchase and work the optical lantern.

**ART PHOTOGRAPHY.** By H. P. ROBINSON. 1s.; cloth, 1s. 3d.

In this book Mr. Robinson deals with Art in a manner which the student can understand and appreciate. No amateur should be without it.

**ART OF RETOUCHING.** By J. HUBERT. 1s.; cloth, 1s. 3d.

The cheapest manual on "Re-touching," written by one who knows, for those who wish to learn.

**PLATINUM TONING.** By LYONEL CLARK. 1s.; cloth, 1s. 3d.

This book has revolutionised printing processes. The instructions given by Mr. Clark permit of obtaining the most delightful range of tones. Every one should buy a copy, and learn how to do it.

**EVENING WORK.** By T. C. HEPWORTH, F.C.S. Just Published, cloth, 2s. 6d.

This is a most delightful book, from which any number of good things may be learnt. The Chapters on the application of the ELECTRIC LIGHT to photography are most interesting and instructive.

NOTE.—Any Photographic Publication can be supplied by Messrs. HAZELL, WATSON, & VINEY, LD., and a full list of books upon Photography will be sent upon application.

London: HAZELL, WATSON, & VINEY, LD., 1, Creed Lane, E.C.

**PICTURE MAKING BY PHOTOGRAPHY.** By H. P. ROBINSON. Cloth, 2s. 6d.

Is a book for the art student to study carefully. The examples given will help him materially to make pictures.

**EXPERIMENTAL PHOTOGRAPHY.** By CLEMENT LEAPER, F.C.S.

1s.; cloth, 1s. 3d.

This book is a guide for the beginner, and traces the whole course of work for any one taking up photography. It should be the constant companion of the Amateur Photographer.

**CAMERAS, LENSES, AND SHUTTERS.** By Sundry Writers. 1s.; cloth, 1s. 3d.

This book contains many valuable articles upon apparatus, contributed to the *Amateur Photographer* competitive papers, and which were awarded prizes.

**DEVELOPMENT.** By LYONEL CLARK. 1s.; cloth, 1s. 3d.

A very handy book on developing, which should be read by all; it also contains an article upon the use of Eikonogen. Mr. Clark's successful photographic work should induce many to acquire a knowledge of how it's done.

**A TOURIST'S EQUIPMENT.** By Rev. PRECENTOR MANN, M.A. 6d.

A very useful little pamphlet, giving the most complete instructions as to what kit to take, how to use it, and other useful "tips" for the touring photographer.

**PRIZE PICTURES: THREE WEEKS IN NORWAY.** By PAUL LANGE. 2s. 6d.; cloth, 3s. 6d.

This book contains several most beautiful views of Norwegian scenery from negatives by the author, also a brightly written account of the trip. The illustrations are allowed to be some of the finest ever produced.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

*Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.*

*Birmingham Daily Gazette, "A Day with the Warwickshire Survey." The writer says:—*

"There were lions in the way when the scheme was first mooted. Who was to find the money? Who should edit the Survey? Who could spare time, trouble, and cash for a philanthropic task involving years of hard work? One by one these objections are in the way of being answered. To begin with, a Hundred has been successfully surveyed in another country, and in America, where the survey of a shire would seem a trumpery job, an enterprising photographer has managed to put some 600 miles of river through his camera, and present a complete panorama of its every reach and turn and swirl and rapid. The editor can be evolved as the work proceeds, and the cost can be counted when the work is fairly in trim. Already some hundreds of negatives have been taken and stored and arranged as the nucleus of the Survey; and now the Birmingham section has arranged a series of excursions intended to cover this season's work. The Hundred of Hemlingford is to be mapped this year in some half a dozen formal trips, and half a hundred individual tours. Since May opened, scores of photographers have been steadily at work every week; and if when the weather brightens into a semblance of summer, the number will be trebled, and a thousand photographs of more or less direct value taken every month."

We understand the work of the Survey proceeds rapidly. The Committee are energetic men, and a survey upon the lines laid down by them will be most valuable. Of course, it is not interesting to the dilettante photographer to have his course mapped, and to be instructed as to what he is to take; still, he must remember the work he is helping in will be priceless in a few years, and, after all, is of far more real worth than much of the so-called picture making. Many lessons will be learnt whilst out with the Survey, and notes can be made of places to visit and pictures to be secured at another time.

TUESDAY'S *Birmingham Daily Gazette* had a leader on "Photography," in which the art-science, its pleasures and its profits, are set out in the following lines:—

"The burst of true summer weather which has given us golden days of lengthening light such as make the month of June famous, has afforded the amateur photographer his long-awaited opportunity of pursuing the most delightful and most useful pastime which has been discovered for leisure hours. It is remarkable how enthusiastically this hobby—if we may so describe it without appearing flippant—has been adopted by people of all ages and of either sex. The school-boy may be seen with his detective camera taking snap-shots at his own sweet will at every passer-by. Every young lady deems it necessary to photograph views of the places she visits on her holidays, and in all the popular resorts she may be seen viewing scenery with a professional eye and talking mysteriously to her friends of dark-rooms and sensitised plates, and 'hypo solutions,' and alum baths. Superior people speak loftily of all

**QUARTERLY EXAMINATIONS.**

WE would call attention to the close approach of the latest date for entering photographs in the AMATEUR PHOTOGRAPHER "Photography at Home" Competition. This competition is open to all comers, with special classes for past prize winners. All entries must be received on or before the 30th of June.

NEXT week we shall be able to announce the result of our first "Public Schools" Competition. We fear the number of entries will not be numerous, but much of the work already received shows signs of very careful working.

BEFORE very long every branch of the Y.M.C.A. will have a photographic club attached to it. The latest we have heard of is at Manchester. Already some thirty members have been enrolled, and some very fair work is being done. The club is under the presidency of Mr. W. H. Newett; and the Hon. Secretary, Mr. Geo. B. Swann, 56, Peter Street, Manchester, will no doubt be pleased to answer any questions sent to him.

An interesting article appears in a recent edition of the

this as a 'craze,' and think that it will have its day like the guitar, the lap-dog, the spelling-bee, and other trifles in which the feminine mind takes a temporary interest. But we doubt it. If photography simply consisted of lifting a shutter and exposing a plate, the amusement would soon become tedious. Those languid amateurs who are content to 'take' the photograph and leave the professional hand to develop the plate and produce the print soon weary of the play. It is they who penetrate the pleasing mysteries of photography and who master the whole process who find the pursuit grows more fascinating the more it is followed. Besides, there is really no end to the art, or to gaining proficiency in it. There is a deep beyond the deep, and a height beyond the height; and when the amateur has managed to print his first pinky, spottled photograph, he realises that he has still much to learn before he can produce a picture perfect in detail, harmonious in tint, soft and effective, with light and shade well proportioned, the perspective true and the leading features well defined. In order to encourage amateurs to aim at good work, exhibitions are held in various parts of the country, and prizes are being offered for the best specimens of photographic skill."

THERE has existed for some years a photographic society at Halifax, but it has, like, we fear, too many, languished for want of zeal. We understand that it is now intended to form a photographic club with the title "The Halifax Camera Club." Already, at the preliminary meeting called on Monday evening, some forty-two residents in Halifax and district signified their intention of becoming members. Efforts will now be made to obtain suitable premises with studio, dark-room, enlarging-room, a large room for meetings, reading-room, etc. A considerable sum has been promised towards the furnishing fund in addition to the subscriptions. There are to our knowledge many earnest workers in and around Halifax; these should lose no time in communicating with Mr. E. Finlison, Union Bank, Halifax, who has consented to act as Hon. Secretary *pro tem*.

In the *Electrician* for June 5th is an interesting paper illustrated by blocks on "A Photographic Study of the Electric Arc," which gives an account of the photographing of the alternating electric arc and the establishment of the proof of the rapid periodic extinction and re-establishment of the discharge. The method of obtaining the images is described as follows:—

"A camera with long bellows was set up near the lamp, the distances from plate to lens and from lens to lamp being such as to give a somewhat enlarged image of the arc. In the focal plane an opaque screen was mounted, which contained an opening just large enough to receive the image of the carbon points. The apparatus having been adjusted, a sensitive plate was driven past the aperture at high speed. The photographic image differed from that observed in a revolving mirror, chiefly in the relative brightness of the arc proper, and of the incandescent carbon of the points. To the eye, the latter is the dominant feature; whereas the *actinic* image of the arc far exceeded in intensity that of the carbons."

THE summer season is again marked by our receiving the prospectus of the photographic section of the exhibition of the Royal Cornwall Polytechnic Society. The fifty-ninth exhibition of the society will be held at Falmouth, and be opened on the 25th of August, and medals are offered for work done by professional and amateur photographers in the following classes:—Landscapes, Portraits, Composition Pictures, Instantaneous Pictures, Interiors, Transparencies, Pictures by Improved Processes, and Enlargement Landscapes. Medals are also offered for improved apparatus and appliances. Information, entry forms, etc., may be obtained of Mr. W. Brooks, Laurel Villa, Wray Park, Reigate, or of Mr. Edward Kitto, The Observatory, Falmouth. Photographs must be received at the Polytechnic Hall, Falmouth, not later than August the 18th.

MANY of our readers will hear with much regret of the sudden death of Mr. D. P. Rodgers, a very active member of the Committee of the Camera Club, and one who, we understand, rendered much service in establishing the Club in their new home. Mr. Rodgers did not exhibit extensively, but was much given to making experiments, and contributed the results of his work in several papers read before photographic societies.

WE have received a letter from Mr. C. H. Bothamley, F.I.C., F.C.S., President of the Photographic Convention. We regret that it came to hand too late for insertion, but the principal points which he calls attention to are:—

"That the Convention has amongst its adherents a very large proportion of the best-known amateur and professional photographers in the kingdom, and affords the best existing means of bringing together photographers from all parts of the country, and thus enabling them to meet their fellow-workers in the art, and discuss with them its later developments and the means of promoting their common interests.

"The President of the Bath meeting will be Mr. William Bedford, whose name and work are familiar to every photographer, and his well-known tact and skill in the conduct of affairs are a guarantee that the control of the arrangements and the guidance of the discussions which it is hoped will follow the papers, will be in safe hands.

"With the help of our friends at Bath, we have been able to arrange a programme which, both from the point of view of excursions and papers, will compare favourably with that of previous years.

"We shall have considerable facilities for making excursions from Bath, either singly or in parties. During the week of the meeting, the Great Western, the Midland, and the Somerset and Dorset Railway Companies will issue to any member, on production of his *signed* ticket of membership at the booking office at Bath, return tickets at a single fare to any station on their respective lines not more than fifty miles distant.

"The excursions are of special interest, and, as already announced, include Chepstow and Tintern, Glastonbury and Wells, Salisbury, Corsham and Lacock Abbey, Bristol and Clifton. In addition, the Local Committee has obtained permission for members to photograph in the churches and other places of interest in and about Bath.

"The papers are fewer in number than in previous years, with a view to prevent hurry, and to give time for discussion which hitherto has often been cut short in order to make way for the following papers. The paper by Mr. W. Lang, on the 'Photographic Work of Herschel and Fox-Talbot,' and that by Mr. Common on 'Recent Work in Astronomical Photography,' are especially appropriate at a meeting in a district that is so intimately associated with the names of Fox-Talbot and of Herschel.

"One very important feature of the meeting will be the final report of our Lens Standards Committee, and the discussion thereon; and the discussion on International Standards that Mr. Warnerke has promised to open. It is proposed to appoint a committee to draw up a report or series of recommendations for presentation at the forthcoming International Congress in Brussels.

"An exhibition of lantern slides will form one of the features of the opening meeting, and it is particularly requested that members who have slides of places visited at the last Convention, whether actually taken during the Convention meeting or not, will send them to me at the Yorkshire College, Leeds, or to Mr. W. Bedford, 326, Camden-road, N., at least a week before the opening meeting."

We would remind our readers that the annual subscription to the Convention is only five shillings. The work of the Society is well worth supporting, and those who can spare the time will have little reason to regret becoming members and spending a week in the society of their fellow workers. Bath offers many inducements, and the excursions have been arranged to give work for the photographer and pleasure to those who make the Convention their annual holiday. Mr. J. J. Briginshaw, the Hon. Secretary, 128, Southwark Street, S.E., or the Hon. Local Secretary, Mr. E. J. Appleby, 8, Argyle Street, Bath, will send programmes on application, and give every information. The week will open with a reception on the 6th prox.

## VARNISHES AND VARNISHING.

NEGATIVE VARNISHING is an operation by no means generally practised amongst amateurs. Some are careful to varnish every negative, and others only do it spasmodically, the majority leaving it alone altogether. Possibly one reason is that with most of the varnishes on the market the negative has to be warmed, and it is entirely a matter of practice to be able to successfully varnish a negative without getting any varnish on the back of the plate, and without showing any waves of double thickness. The following notes may be of assistance in this respect.

We shall first of all consider the manufacture of a varnish, and then the manipulation of the same. Negative varnishes are almost exclusively "spirit varnishes," though occasionally other solvents are used. The idea of a varnish is to provide a coating of some substance which is practically impervious to moisture, and thus protect the gelatine or image-bearing film from damp; and further to provide a protection for the gelatine against accidental mechanical injury. The chief use of a varnish may also be stated to be to form a protective coat against absorption of free silver nitrate in certain silver printing processes. A question often asked by amateurs is, whether varnishing is a necessary operation, and whether taking one proof from a negative before varnishing is liable to cause silver stains? To these questions we unhesitatingly answer that not one proof even should be taken from a negative without varnishing, or in some way preventing the possibility of silver staining, which is very much easier to prevent than to cure. One method which has been suggested is to place a sheet of thin mica between the film and paper, and the consequent slight depreciation of sharp focus is by no means disturbing in a proof. Celluloid might be used for the same purpose.

There are innumerable formulæ for varnishes extant; but we shall content ourselves with two or three well-tried formulæ, premising that it is desired to make the varnish one's self. Many are content to buy commercial varnish, and such may certainly be relied upon. The first formula is one by W. K. Burton:

Gum juniper	..	..	..	2 oz.
Venice turpentine	..	..	..	$\frac{1}{2}$ "
Oil of turpentine	..	..	..	1 "
Methylated spirit	..	..	..	20 "

Gum juniper is the trade name for sandarac, and the above quantity should cost at the outside eighteenpence. Burton recommended gum juniper as being preferable to sandarac, but the one is merely the trade name for the other; he also recommended alcohol, sp. gr. .825, but if pure methylated spirit, 63 over proof, be used, the cost is nearly one-half and an equally efficacious varnish obtained. This varnish is of a very pale colour, and the film will stand a good deal of hard usage without cracking. With this, however, the negative must be warmed. Crystal varnish may also be used for negative work, but it will not stand such rough wear, and also requires heating in cool weather, or it will not dry bright. This is made by dissolving:

Gum dammar	..	..	..	25 gr.
In benzole	..	..	..	1 oz.

Hitherto shellac has been the principal ingredient in negative varnishes, and a good formula of this character is the following:

Orange shellac	..	..	..	2 oz.
Sandarac	..	..	..	2 "
Canada balsam	..	..	..	60 gr.
Oil of lavender	..	..	..	1 oz.
Methylated spirit	..	..	..	16 "

Shellac varnish always requires clearing, there being a wax in the lac which is insoluble in alcohol. This clearing may be effected by shaking up some heavy inert powder, such as

kaolin, prepared chalk, or pumice-stone, with the varnish, and allowing to settle. A quickly made and convenient varnish is to be obtained by diluting

Best white hard varnish	..	..	15 parts.
With methylated spirit	..	..	25 "

the only objection to this being that it takes somewhat longer than usual to dry.

Whilst giving formulæ for varnishes, we append one or two which may be useful in other operations besides varnishing negatives. A good varnish for protecting maps, chalk drawings, etc., may be made as follows:—

Mastic	..	..	..	1 oz.
Sandarac	..	..	..	2 "
Powdered glass	..	..	..	2 "
Ether (methylated, sp. gr. .725)	..	..	..	5 "
Methylated spirit	..	..	..	10 "

The glass is merely used to powder the mastic and sandarac, and to act as a clearing agent, and to prevent the gums from agglutinating at the bottom of the vessel. This varnish must be filtered, and should be applied by means of a spray diffuser, and can thus be applied to enlargements on bromide paper, chalk sketches, etc.

For waterproofing home-made wooden dishes the following will give every satisfaction:—

Colophony	..	..	..	2 $\frac{1}{4}$ oz.
Shellac	..	..	..	$\frac{1}{2}$ "
Turpentine	..	..	..	9 "
Yellow wax	..	..	..	$\frac{1}{8}$ "
Methylated spirit	..	..	..	20 "

Melt the wax in a water bath, and add the resin and lac, and then the turpentine, and finally the spirit. Two coats of this, followed by one of white or yellow furniture varnish, will preserve any tray for a long time, provided alkaline substances are not used in it.

The most successful, or perhaps we should say the varnish which will give the most successful results in the hands of an amateur, is a so-called "cold varnish;" that is to say, one which can be applied without heating the negative, either by flowing on or by the aid of a brush, the former being far more preferable. One of the best known cold varnishes is made by dissolving

Bleached shellac	..	..	..	3 oz.
Borax	..	..	..	1 "
Distilled water	..	..	..	25 "

The shellac must be recently bleached or else it is quite insoluble, and it should be broken up small and heated with the borax and a little water till fairly hot, then more water being added by degrees. This varnish should be filtered and applied with a brush if desired.

By far the best cold varnishes, however, are those made with amyl acetate or acetone. Hydrated acetone may be used as a solvent of gum juniper or sandarac, and a little mastic acid will prevent its chipping; so far as we are aware, such a combination has not been tried as a negative varnish, but it gives a quick-drying hard film. Amyl acetate has been used as a solvent of pyroxylin for making a varnish, and such a solution has been introduced in America under the name of zapon-varnish. According to Max Jaffé (Eder's "Jahrbuch," 1890), this varnish is excellent for gelatine negatives, and is a solution of celluloid in amyl-acetate and acetone. We have not tried celluloid, but the following gives an excellent varnish:—

Pyroxylin	..	..	..	15 gr.
Acetate of amyl	..	..	..	1 $\frac{1}{2}$ oz.

If too thick, a little acetone may be added, or more acetate of amyl. This may be poured on to the film and flowed over the negative like collodion, or if a good thick pool is poured on to the centre of the plate it may be evenly distributed with a camel's-hair brush or glass rod without

showing any marks, streaks, or waves when dry. The only objection to this varnish is that it takes some time to thoroughly dry out. Twelve hours in a warm place is not too long to leave the negative after varnishing. When dry, the film is very highly glazed, and will stand a lot of hard usage and damp without showing signs of distress.

To those operators, however, who are afraid of failure, even with this varnish, we recommend the following plan, which, after two years' trial, we guarantee to be easy of application, a certain preventive against silver stains, and not expensive. The negative, which must be thoroughly dry, is warmed in front of the fire till sufficiently hot to be unpleasant to the back of the hand; then a pad of cotton

### THE JUBILEE COSTUME BALL.

By the courtesy of Messrs. Disdéri, of 4, Brook Street, Hanover Square, we have had the pleasure of inspecting the platinotype prints of the tableaux given by the members of the Royal Institute of Painters in Water Colours at their Jubilee costume ball. There were also separate photographs of each of the ladies and gentlemen included in the groups, and the whole make a collection which is not only of considerable interest but will be of historical value. There were four tableaux: one "The Presentation of the First Prince of Wales," which includes eleven figures, and was designed and superintended by the President, Sir James Linton; another was "Queen Anne Receiving the Duke of Marlborough after the Victory of Blenheim," of which, by the kindness of Messrs. Disdéri, we are able to give a reproduction. It

TABLEAU BY MEMBERS OF THE ROYAL INSTITUTE OF PAINTERS IN WATER COLOURS.

Queen Anne receiving Marlborough after the Victory of Blenheim.

(From a photograph by Disdéri and Co.)

wool, linen, or wash leather smeared over with encaustic paste, as used for prints, is rubbed all over the surface, and then a clean pad used to polish till no greasy marks are to be seen. The film of grease thus left on the negative is utterly without effect on any printing paper, and as a proof of its impermeability to water, a few drops sprinkled on a negative thus treated may be wiped off after half-an-hour without showing sign of dampness. If encaustic paste is not to be had, the scrapings of a good composite candle will do equally as well.

was designed and the arrangements superintended by Mr. Charles Cattermole, R.I. Another was "Queen Elizabeth Knighting Drake," which comprised thirteen figures, arranged by Mr. Charles Green, R.I. The other was "The British Empire, 1887," containing eight figures representing the various portions of the empire; a Hindoo girl, an Australian squatter, a North American Indian, a Canadian trapper, etc., with Britannia placing a laurel crown on a bust of Her Majesty. In addition to these four tableaux, there were taken eight photographs of a gavotte which was danced at the ball, the dancers wearing old English dress. As photographs, the effect of the latter pictures is much better than the former; they are full of life and one almost expects to see the dance go on. We must congratulate Messrs. Disdéri on the success of their labours. We are desirous to state that the exhibition of the pictures is open at the Gallery to all photographers, amateur and professional, who would like to see them.

**Photographic Society of Great Britain.**—The rooms will be closed from July 29th to August 4th. The Exhibition of Photo-chromos will remain open daily between 2 and 9 p.m. till the 30th inst.

## Letters to the Editor.

### CONJUGATE FOCI.

SIR,—By the frequent appearance in your "Queries" column of questions relating to the conjugate foci of lenses when used for enlarging or reduction, many photographers must be unaware of the extreme simplicity of the formula for obtaining them. The simplest method is to add 1 to the ratio of enlargement (or reduction), and multiply by the equivalent focus of the lens, which gives the greater conjugate focus. To obtain the lesser conjugate focus divide the greater by the ratio number. For instance, if we are enlarging from 5 by 4 to 15 by 12, the ratio (linear) will be 3 to 1, and with a 7 in. lens the greater conjugate focus will be  $(3+1) \times 7 = 28$  in., and the lesser will be  $\frac{28}{3} = 9\frac{1}{3}$  in.

The formula is best expressed by—

$f + fr = \text{the greater conj. foc.}$

$f + \frac{f}{r} = \text{the lesser " "}$

where  $f$  = the equivalent focus of the lens, and  $r$  = the ratio number of linear enlargement or reduction. If we have a lens of  $8\frac{1}{2}$  in. focus and wish to make a lantern slide to include the full width of a half-plate negative, the ratio would be  $4\frac{1}{2}$  to  $3\frac{1}{2}$  or 19 to 13. Then,  $8\frac{1}{2} + 8\frac{1}{2} \div \frac{13}{19} = 14\frac{6}{19}$  in., the lesser conj. foc., and  $8\frac{1}{2} + 8\frac{1}{2} \times \frac{13}{19} = 20\frac{13}{19}$  the greater.—Yours, etc.,

THE SMITH.

\* \* \* \*

### A FOCUSING CLOTH.

SIR,—Having just become an amateur, I have found, for well-known reasons, the focussing cloth to be the source of much trouble; but a Yankee is always able to help himself, and I have hit upon a device which my friends greatly approve of. I therefore take the liberty of submitting my idea, feeling assured that many others will take it up.

I bought a piece of cloth, measuring 52 ins. by 18 ins., and a piece of elastic band 48 ins. long. The former cost sixpence, the latter fivepence, and therefore the total outlay was elevenpence.

I proceeded to lay the elastic around the back of the camera, and in joining the ends stretched the band about one inch. Of the cloth, I had a bag made, the elastic being let into the front. As the cloth is 6 ins. longer than the circumference of the swing back, it is an easy thing to slip the elastic band, and with it the cloth, over the camera. The back opening I have made smaller, and when slipped over the head, it will remain. To any one who is not perchance obliged to wear eyeglasses, I would recommend to insert elastic into the back opening, so as to make it even more safe. It will be best to secure the shape of the cloth with a few stitches.

Its advantages are evident. You can slip it on or off in a moment, your hands are free, and you can turn any screw of the camera, without hunting for it. If made of waterproof cloth, you can by attaching a couple of loops at each end, make a nice bag of it for camera and slides.

The above description applies to front extension cameras; if you have one of another sort you will have to think a little for yourself.

NOX-ALL.

June 9th, 1891.

**Blue Prints.**—In a communication to the *Engineering News*, Mr. F. H. Latimer states that he has found that adding oxalic acid to the ordinary blue print mixture materially lessened the necessary time of exposure. The solutions used were:—(1) Ammonio-citrate of iron 120 grains, water 1 fluid ounce, to which is added a few drops of strong ammonia solution till the odour is quite perceptible. (2) Potassium ferricyanide 105 grains, water 1 fluid ounce. (3) Saturated solution of oxalic acid. Equal quantities of the first two solutions were mixed together, and to 10 parts of this mixture from 1 to 3 parts of the oxalic acid solution are added just before use, with the result that in cloudy weather the solution containing three parts of oxalic acid prints about ten times as quickly as the pure solution. For ordinary purposes, however, it is better not to add more than 20 per cent. of the oxalic acid solution, or difficulty will be found in getting the lines to wash white.

## Studies in Art for Photographers.

By REV. F. C. LAMBERT, M.A.

### CHAPTER IX.

#### CONSISTENCY, HARMONY, FITNESS.

THERE is observable in all good art, be it poetic, dramatic, or pictorial, a certain three-cornered idea, hard to define, yet easy to recognise and still more easy to become conscious of by its absence, "for when we would, we have it not." This indefinable something comes to us sometimes under one, sometimes under another of the three terms standing at the head of this chapter. It is, however, entirely a secondary matter by what name we shall know it, so long as its presence is desired, and its absence regretted.

We have recently seen that *contrast* often emphasizes and gives precision to the characters of different things; but *consistency*, connecting different parts, tends to emphasize the naturalness of their union—being a mark and feature of the general coherence of parts. When we apply the term *harmony*, it is chiefly with regard to relations of agreement between the parts. And when the *fitness* (or *unfitness*) of any part demands attention, it strikes the mind—as a desirable (or undesirable) element—as something which adds to, or detracts from, the previous state of affairs.

A moment's consideration will also show us that we may apply the terms, or perhaps, rather, the idea, in various ways, e.g., as regards forms, light and shade, etc. But transgressions in this direction, if more obvious, are yet less fatal to fine work—good art—than when there is a want of harmony between the theme and its treatment: the soul and the body are at variance.

Perhaps, after all, we may find "the longest way round the shortest way home," i.e., by considering a few crude examples of *inconsistency*, *discord*, *unfitness*, we may be able to gather some general ideas.

It is at once a curious yet suggestive fact that the first attempt at art criticism made by the uncultured nearly always takes the form of selecting some inconsistency. One has only to mingle with the crowd on a Bank-holiday, in any free picture gallery, to hear the intelligent working man point out that there is no sawdust coming from the saw, no shavings curling from the plane, while his wife remarks upon the absence of soap-suds at the wash-tub, and the small boy observes his pseudo-companion playing marbles with the left hand, and so on. It is true that this is the first step taken from the realist's standpoint, but the next step is very likely to point out the inconsistency of representing a rustic fisherman in a "chimney-pot" hat, or the maid hanging out the clothes when the sunset sky indicates the time for taking them off the line.

It perhaps may require some further measure of cultivated observation to enable us to see that the shadows cast by the twilight, streaming through the window, will be affected by the lamp on the table, or that the expression on the man's face, who is administering medicine to his dying child, is an expression better fitted to the jovial huntsman, relating his last daring adventure. Still more may it require a cultured taste to perceive the lack of harmony between the poetry of some love scene and the realistic common-place nature of the surroundings, and the subsidiary aids used in relating the story; or it may be that few perceive the crude harsh discord set up by the scheme of colour chosen for a delicate portrait study—or that the range of tint and tone is out of feeling with the sentiment of some sombre, cool, quiet landscape.

Here, as elsewhere, no rule can be laid down. Each

case must be examined and treated on its merits. One case may demand stern realism, while another lends itself to idealism. But in whatever way it seems desirable to treat any case, it must always be remembered that the method of treatment must be *consistent throughout*. And this harmony of parts is to be observed as regards emphasising forms, light and shade, grouping, selection of secondary and supporting parts, tint, tone, key, scale, etc.; but alone and through all, the word of command must always come from the theme, the chief and central *idea*, of the picture.

Fortunately, the photographer is not tempted to such misrepresentations as occur to the painter who is free to introduce or omit anything. And it is the painter who, feeling this superior power, is thereby urged to deny the photographer any power of selection (and therefore of composition). This is, of course, entirely a mistake on the part of the painter, and in many cases it would be well were he as restricted to fact as is his oft-despised brother. With painters we are, however, not now concerned, beyond observing the point that the limitations which he does feel are the anchors of salvation for the photographer. An example will make this clear. Suppose the painter is at work upon what he desires to be regarded as a faithful rendering of a certain landscape in which a clump of trees interferes with the sails and rigging of a vessel. The painter will, with as equal freedom of conscience, move his trees to the left or right as he will shift the vessel up or down stream. The photographer perceives at once that as trees are by nature more or less stationary, his only proper course is to bide his time until the vessel moves one way or the other. Hence it is clear that the photographer feels the justness of his limitations as regards adjusting the relative position (presence or absence) of such parts which by nature are open to such relations.

Thus the first great division of truth and untruth is made for him, and he must rely on the culture of his taste and judgment for the selection of best time, etc., and arrangement of moveable parts, figures, etc.

It is a matter of great regret, however, that many, far too many, photographers scoff and scorn the very existence of any such thing as a need for art study or education. The wisdom of eighteen centuries is unanimous in confirming the statement that although all things may be *possible*, yet they are not necessarily *expedient*. No great harm will be done if, taking a hint from this, we say all truth is not beautiful; that which is possible is not necessarily admissible or desirable.

It may, with much truth, be said that there is but one law of composition, viz., the law of unity, *i.e.*, that all other laws are only means towards that end; so also, with equal truth, might it be said that the chief end and aim of composition is to secure complete and perfect harmony throughout the entire work.

Some little time ago there was a wave of fashion teaching us to borrow the terms of music for application to pictorial art, and bidding us talk of symphonies in green and gold, etc. Now, although much more may be urged in favour of some of these terms than many might suppose, yet it behoves us not to use them without being fairly clear as to what idea they shall imply. For instance, the term harmony is thus used in pictorial art to mean the effect of illuminating a scene with a more or less monochromatic light. The great beauty of this may often be seen at sunrise or sunset. Hence these effects are usually associated with a certain measure of poetic sentiment.

Again, the experienced general will frequently divide his forces and so plan his attack that it may be made simultaneous, but at different points; yet all in harmony and

guided by one master mind. So, also, will the skilful artist so plan his attack that we are carried away, not so much by any one part or feature, to the exclusion of all the rest, but rather by the united and combined appeal, made so harmoniously that we fail to perceive it to be composed of more than one great and guiding feature, and thus bringing our mind into sympathy and harmony with that of the worker.

It is certainly not over-stating the matter when we say that this subtle principle which we call harmony and which baffles definition or precise description, nevertheless is the most rare and the most precious quality of a work of art.

## Diversity in Art.

BY SENEX.

WE have, in a former paper, alluded to diversity in art. This is a subject which just now offers much material for consideration, and the more so as there is a direct conflict of ideas between those whose liberal taste and feeling recognise truth and beauty wherever they find it, and those who deny excellence unless it is looked at through a peculiar medium of their own choosing.

There is an oracular way of writing about art which is evidently very seductive to those who indulge in it. The effect intended is rather to startle than to convince the reader, to create a sensation in his mind, to put him off his balance and keep him there. And, unfortunately, there are many who are too far carried off their feet by this fancied monopoly of taste to think of examining the matter for themselves; or else they are only too glad to escape the study of a difficult subject by pinning their faith on those who tell them that there is no subject to study. What wonder that the student should come to the conclusion that perversity in art and diversity of art are the same thing?

The theories which endeavour to restrict and control art, and to make it independent of the effects produced by originality of imagination and feeling, naturally lead to all sorts of false and delusive conclusions, and to inconsistencies of argument which make one aghast to read them. For instance, we are told to admire the beauty of a Dutch picture, first of all for a reason which everybody will admit to be just, namely, its marvellous technical fidelity, and then because it depicts something that took place when the artist was alive. This second qualification is insisted on as decisively as the first, and a standard of taste set up which must not be infringed. What then must be said about pictures which do not conform to this standard? Something must be said about them. What is it to be? Let us take a mythological subject, "Venus and Adonis," by Titian. Judging from what we believe to be the true and genuine impression of things, we should have thought it sufficient to find here a perfection of form and colour, a power of generalising and individualising, a softness and delicacy of outline, the richest contrasts and most subtle gradations of colour, all giving the highest distinction to the story. No, says the critic, this is not excellence at all. If it gives pleasure it is a false pleasure. Titian never saw Venus and Adonis, and therefore the merit of the picture belongs to another man!

Let us look at this wonderful argument for a moment, and push it home to its legitimate corollary. Shakespeare is generally supposed to have adorned and transformed every subject that he touched, and to have given to it a lustre that time will never dim. Nothing of the kind. Shakespeare's plays were all taken from Plutarch's Lives, Holinshed's Chronicles, Italian stories, etc. Therefore, all the credit of them belongs to another man. Tennyson, when

he wrote "Enone," probably imagined himself quite innocent of literary theft; at any rate, those who read the poem find in it a sublimity, a truly religious and wise philosophy, which seems to proceed from the poet's own mind entirely. Nothing of the kind. The credit of it all belongs to another man. And so on *ad infinitum*, wherever an idea has been ennobled, whether in poetry or picture, by originality, imagination, and power.

What we complain of in this kind of criticism is its want of any defined principle except of the narrowest and sourest kind. Nothing is seen in a picture but the execution. There is no key given us to unlock any other beauties of any other kind. Execution is the only beauty. We are told to admire the *beauty* of Van Eyck's picture of the merchant and his wife, in the National Gallery. Well, we yield to none in admiration of the painstaking and laborious finish of this wonderful picture. But in our desire to acknowledge the excellencies of all original genius, we find it impossible to pretend to find qualities that do not exist. If one of the tests of beauty in art is found to be when it combines fidelity of imitation with refinement of character and expression, it is not to be seen in Van Eyck's picture. The figure of the woman is essentially vulgar, and not only that, but intentionally so; and the man's figure, to say nothing of its grotesque appearance, is equally vulgar. Here truth and beauty are *not* united, and before this mere mechanical power can be raised to the rank of the beautiful, it must cease to consist in and depend upon any one excellence to the exclusion of the rest.

When the pre-Raphaelites in 1848 broke out into open rebellion against their *alma mater*, the Royal Academy, it was to enter their protest against a method of teaching which had entirely strayed away from and forgotten nature. This system consisted in producing pictures from art studies, and continually copying and conventionalising other men's ideas without reference to nature in their compositions. Mere imitation of existing models and adherence to prescribed rules was supposed to result in qualities superior to the cultivation of natural powers.

It was the motive, not the actual drawing of the painters who preceded Raphael, that the pre-Raphaelites strove to emulate and attain to—the simple return to the study of nature, instead of the copying of somebody else's ideas of nature. And in this they were perfectly right. It was only to be expected that men who had so unceremoniously cut themselves adrift from time-honoured methods and maxims which quenched everything in the shape of originality, and who had nothing but their own natural powers, and whatever bent of original genius they might possess to guide them and trust to, should have floundered a good deal in their desire to be rigidly right, and should have neglected the refinements of art for the literalness of it. But when Millais' Huguenot girl appeared, all doubts as to the wisdom of, and the necessity for, the schism were set at rest. For in the fidelity to nature, combined with the exquisite melting pathos of that appealing face, truth and beauty were united.

This, then, is what the student, in his search for diversity in art, has to seek—the union of truth and beauty. It is a simple test; it is as old as the hills, and quite as beautiful.

All great changes in art have been of the character we have just described, and have sprung from an unconquerable desire to see and think for yourself, and a determination to cease borrowing for ever; to abandon the mere imitations of style and conventional models, and to strike out a separate path independent and original; to get away from the powers that be, and to unfold new ones of one's own, whose principles should be in the individual mind freed

from the clutch of custom. Such men soon learn to see things in nature that their teachers have missed altogether, because they looked in the wrong place for them, or only through the medium of obstinate prejudice.

In painting, as well as in architecture, there are no laws applicable to all works and all countries; the tendencies and the means of execution are different according to the schools. The value of the study of this diversity consists in this, that it enables us to discover how the various interpretations of nature arose, and what they were. Not that these great men found anything new in nature, but that they saw it as no one had seen it before, leaving to us, at this distant day, the priceless legacy of a new intuition.

Conscious of beauty, let the student in art seek and analyse its source, that he may not pretend to find it where not even the artist suggested it. Conscious of defects, let him be wisely tolerant of them, that he may not miss excellencies. For

The fault, dear Brutus, is not in our stars,  
But in ourselves, that we are underlings.

## Notes on Perspective Drawing and Vision.\*

By DR. P. H. EMERSON AND T. F. GOODALL.

SOME years ago we made some experiments with the object of comparing a monocular perspective drawing with the drawing of an aplanatic photographic lens. We found that under similar conditions they were alike, as was, of course, *a priori*, probable. More than a year ago one of us published a short paper with an experiment, which threw grave doubt upon the truth of perspective drawing when compared with what the eye really sees.

We now offer a series of provisional propositions, experiments, proofs, and deductions, which we venture to think are of fundamental importance to all artists, as well as to physiologists and psychologists. We are working now to still further elucidate the matter, but we decided to publish the following notes, so that specialists might perhaps help us in the matter.

Our experiments and deductions, if correct, will show that for scientific reasons the accepted rules of monocular perspective are likely to mislead the artist, and prove the fallacy of photographic and all mechanical methods of measurement.

*Proposition A.*—The eye does not constitute a symmetrical lens,† the top and bottom portions being different. That portion of the eye which perceives distance and distant objects (*i.e.*, those above the ground), sees the objects on a larger scale than the portion of the eye which views the foreground or nearer objects, therefore our impression of nature is not what we get with a mathematically correct perspective drawing, or the drawing of an aplanatic photographic lens. That is, a perspective drawing surprises us by making the foreground objects look larger in proportion to the distance. Also we see a larger arc with the lower half of the eye than the upper.

*Proof 1.*—That we do not see the same amount with both halves of the eye (upper and lower) is proved by the observer lying on his back and looking straight up at the sky, when he will find that the field of vision of the upper half is much more limited than the space seen by the lower half of the eye. This holds for either one eye alone, or for both when used together.

The proof is completed when we stand with our legs apart, and standing with our back to the landscape, bend down and look between our legs. Here the fields are inverted, and consequently the distance appears small and far off, and gives much more the appearance of a sharp photographic rendering of the

\* When we use the term "perspective drawing," we mean a mathematical drawing of various objects in the field of vision (*i.e.*, angular measurements), as received on a glass plate (ordinary perspective drawing) or upon the screen of a camera, for, under like conditions, they are, as is well known, identical.

† We have ignored for the sake of simplicity the optical law of inversion of the image on the retina; when that is considered, the terms "upper" and "lower" must be merely interchanged.

scene. This peculiar effect has long been well known, and it has puzzled a good many observers, but hitherto no valid scientific explanation has been offered.

*Proposition B.*—We think this may be the result of the naturally selective action of the retinal nerves. It has been to our advantage in the struggle for life to see all the objects near to us and close around clearly, and to compass as wide a field as possible. It has also been to our advantage in the struggle for life for certain parts of nerves to try and draw distant objects nearer and to enlarge them, so that special functions may have developed purely by natural selection.

*Deduction 1.*—That mathematical perspective drawing gives quite a false impression of what we see when using *either one of our eyes or both*.

That such is actually the case we will now endeavour to prove, at the same time still further supporting our contention that the upper and lower portions of the eye see objects in different perspectives.

*Proof 1.*—Let the observer select a church tower or tall chimney for experiment. If the sides are parallel, the object will *appear* to his eye wider at the top than at the bottom when he stands facing it at the distance of the tower itself, and looks steadily at its centre. These experiments are best made in the diffused light of evening. The experimenter must not move his eyes up and down the tower from top to bottom, and so *measure or correct* his impressions, but he must look steadily at the centre of the tower and take his pure sensuous impressions. As most towers and chimneys do taper considerably, the result the observer gets when close to them is that they *look parallel*, or nearly so. This fact was, no doubt, felt by the architects of the Parthenon, and it has never been known why they built the columns leaning inwards, a little out of the perpendicular. That they were built out of the plumb has been proved by measurement; that they *look parallel* is well known, and the reason of this we venture to find in our proposition.

*Proof 2.*—A very simple proof is to look about the middle of a doorway or door; it will be felt that the door or doorway is wider at the top than the bottom. The same holds with books in a book-case.

*Proof 3.*—Cut two slips of paper: (a) 8 inches long by 2 inches wide; (b) 8 inches long by 2 inches by  $1\frac{1}{2}$  inches wide, so that it tapers  $\frac{1}{2}$  of an inch. If the parallel slip (a) be held upright 8 inches from the eye (its own length), and looked at straight in the centre—the centre of the paper being opposite to the eye—the paper will appear slightly wider at the top than at the bottom, the same proviso of not correcting the pure impression by measurement (looking up and down it) holding, as we pointed out in the case of the church tower. If the observer now takes the tapering slip (b) and holds it narrow end upwards, looking at it in the same way, it will *appear parallel*; if he holds it wide end upwards, it will appear much wider at the top than at the bottom. This holds equally true if the experiments are made either with one eye or both, showing that binocular vision has no effect on the impressions.

*Proof 4.*—Another interesting experiment is to place a penny upright on a table, and a halfpenny 18 inches behind it and a little to the right or left of the penny. The eye must look *over* the penny at the halfpenny, so that the penny is a foreground object and the halfpenny a distant object. If the observer now looks steadily at the halfpenny, at the same time seeing the penny, he will find the impression given is that the halfpenny looks nearly as large as the penny.

Proposition A and proofs deal mainly with what we would describe as *vertical vision*—that is, with the variations in the appearances of objects when placed one over the other, as in a vertical column, or with objects at a distance as compared with objects in the foreground.

But within the radius where binocular vision acts (calculated by Mr. T. R. Dallmeyer to be sixty yards), new and important variations occur. These properties we shall consider under the term of horizontal vision.

*Proposition.*—Within the limits where binocular vision effective—say normal vision (8 inches) to 60 yards—objects *appear smaller when they are compared with objects beyond their binocular limit*; that is, they appear smaller as compared with drawings as given by monocular or mathematical perspective.

An experiment to practically bring the effect of the binocular vision variations entering into the matter may be made as follows:—Take the tapering slip of paper aforesaid (b), and

place it between the two eyes, the wide end resting upon the bridge of the nose, the slip being inclined at angle of 30 degs. with the horizon. The result is that the paper vanishes *towards* the eyes—diametrically an opposite result to what perspective would lead us to expect. This phenomenon still holds if the paper be gradually moved away from the eyes, and held at arm's length, but in the same plane.

*Proof.*—Place a book at a distance of six feet from the eyes. Then proceed to measure the width of the book with a pencil (one eye being closed), as a draughtsman draws objects by monocular perspective, and then open the other eye, and measure the width of the book with both eyes; the binocular measurement will be found to be smaller than the monocular measurement. If the height of the book be measured in the same way, there will be no difference in the result obtained with one or both eyes.

But more convincing is Proof 2. Wafer a square sheet of white paper (say 8 inches square) on the wall, or on a window six feet from the observer, and look at it. The impression given will be that it is larger vertically than it is horizontally. This explains the old trick of marking off the height of a tall hat against a wall; as a rule, everybody places the mark too high—the reason is now explained.

Still another proof. Stand a halfpenny and penny on the table, as directed in the previous experiment. Now place the eyes on the same level as the plane of the table and observe. The result will be exactly the reverse to that previously obtained. That is, when looking directly at the halfpenny, at the same time looking (indirectly) at the penny, the penny will appear the larger, and *vice versa*, when looking directly at the penny and indirectly at the halfpenny, the halfpenny will appear nearly as large as the penny.

Another every-day proof. Let a person sit in one end of a long punt with parallel sides, and look at the other end; it will look to him to be wider than where he is, and yet its sides will by perspective laws vanish quickly away from him.

These proofs show the effect of binocular vision, which is to increase the appearance of height and to narrow the appearance of breadth; consequently, it makes objects appear taller than a perspective drawing would do.

*Deduction.*—The reason we get a different impression of relative sizes of objects by normal vision from that given by mathematical perspective drawings and photographs is, that the combination of these properties of vertical and horizontal visions gives quite a different result to that of perspective drawings.

*Final.*—Having shown how we see forms, it only remains to say that a mathematical perspective drawing, or the drawing of an aplanatic photographic lens, does not give forms as we see them. They are altogether false to the visual impression of the proportions of things, and therefore give a wrong idea of the original scene. On the other hand, a perspective drawing or correct photograph gives the *actual facts* scientifically, *i.e.*, the pillars of the temple as leaning, the paper in experiment as *square*. All such drawings are, therefore, purely scientific diagrams, and artists who wish to render what they see must not rely upon them.

## Photography and Fiction.

### AN ALARMING DISCOVERY.

As a nervous amateur who has spoilt more negatives through uncapping the lens at the wrong moment, dropping the plate in taking it from the camera, and discovering the dark-room door only partially closed when half way through the development, than any other living person, I don't mind saying that a recent *feuilleton* in a certain evening paper has given me an uncomfortable shock. I am one of those (there are very few of us left) who believe in spiritualistic photographs, and I don't mind saying that the picture which interested me most in the Pall Mall Exhibition of 1889 was the portrait of the late Madame Blavatsky. You can, from these hints, understand my predilections.

I know pretty well what wonderful things romance writers have made photography do. The list of wonders started pretty well with Mr. Boucicault's "Octoroon," where a coloured gentleman, looking at a dark-slide, saw through the back and developed the plate inside with his eye, thus providentially discovering a murder. Mr. Richard Dowling, I think it was, some years after this

succeeded in taking an instantaneous photograph, in the dark, of a murderer, the lens having fortunately been left uncapped. Miss May Ostlere photographed a supposed dead body, and found out the body was not dead, as it moved.

All these stories and a good many more have not affected me. I knew they could not be true. It has been left for the *feuilleton* already mentioned, to make me thoroughly uncomfortable.

Upon reading this production it instantly occurred to me that I may, unconsciously, have caused my friends intolerable anguish. I was aware their prevailing expression, in my attempts to photograph them, was either one of mental incapacity or unutterable woe, but this is not what I mean. If the writer's theory be true, I may have given them many an attack of neuralgia, or some other agonising ailment. Indeed, I may have gone further, and committed unintentional homicide. Naturally, this has worried me a good deal, and I hasten to lay the case before you.

The writer of the *feuilleton* tells us how a man with a pair of dreadfully mysterious eyes falls in love with the daughter of a wealthy man. The wealthy man objects, whereupon the person with the eyes takes his departure. As he leaves the house the writer sees him receive a cabinet photograph from one of the servants in return for "handful of gold." The photograph is a portrait of the girl with whom the writer is in love. The latter is enraged, and insists upon the person with the eyes handing him the photograph. The person seizes the wrist of the writer and drags him to his laboratory. There amid "all the grinning apparatuses of necromancy the visitor sees "a number of small wax figures with human faces, with needles in the shape of swords stuck into their hearts;" in fact, the paraphernalia of the old witchcraft business.

But necromancy has moved with the times, and the person with the eyes has been able to improve the process by substituting photography for wax. He intends to kill Camille—that is, the girl—but, to quote his words, "I shall not have occasion to make an image, and infuse therein from my own vitality a factitious life, for I am in possession of her life, of a portion of her own vitality, in this," and he brandished the portrait above his head.

This seemed to me to be perfectly reasonable, because according to the Blavatskyan theory you can be in two places at once. I know that priority in this kind of dual personality has been claimed for Sir Boyle Roche and his famous bird, but credit is none the less due to the Theosophists for having revived the idea. Therefore it is quite feasible that a girl should be herself in the flesh and herself in her photograph, unless, of course, the negative has been retouched, when she might well be somebody else.

Being convinced of the truth of this theory, I read the person's explanation with much interest. He says, "Between the body which is placed before the object glass and the sensitive plate, a current is established which takes from the living being, as in a galvanic plastic operation, innumerable particles of its proper substance and life. Chemistry fixes them, nothing more, and between this reproduction and the living being there exists a bond that nothing can sever. There are between them innumerable threads like a system of electric wires, and when I strike or touch these threads of communication they telegraph, and the action is introduced on the living being, who cannot understand why she suffers, sighs, or dies."

This is beautiful, I thought, and then I went on to read how the person with the eyes, drawing a dagger, stabbed the photograph, and that the next morning Camille was found dead. I must confess the whole force of this admirable idea did not burst upon me all at once. When it did I was made, as I have already said, intensely uncomfortable.

I began to ponder over the consequences of this the latest discovery in photography. If, I thought, the vitality of a young lady can be distributed over as many silver prints as she likes to order, how much more vitality must there be in the negative. I had a lurking hope that this "bond" did not exist in every case, but who is to tell, and how, when it does and when it does not?

Anyway, the result of my cogitations has turned my dark-room into a torture chamber. I am certain whenever anything goes wrong with the development, say when the film slips off and disappears into the sink, I shall not be happy until I know I have not also annihilated the original. A week ago I took my friend Smith's portrait, and yesterday the negative cracked in the printing frame. I at once wired to Smith to know whether he too had not had a stroke of some kind, and you cannot imagine what a relief it was when he wired back to know if I was an

idiot. Although I cannot absolutely say that up to the present I have murdered anybody, the deed may happen at any moment. I really feel inclined to give up photography altogether. It is so horrible to think, when I am dipping a plate into the alum bath, the original may have a sort of "gooseflesh" feeling go over his frame as though his skin were shrinking. Who can say while the mounted print is going through the rolling press, my dearest friend may not be agonised with twinges of the gout? I am convinced there is something in the theory, for by accident an albumenised print was left in the washing apparatus all night, and the next thing I heard was that the sitter whose likeness it represented was suffering from influenza. If there is not cause and effect here, I should like to know where they are to be found. I do hope some of the societies will investigate this subject, if only for the sake of any one who may be, like myself, A NERVOUS PHOTOGRAPHER.

## Holiday Resorts and Photographic Haunts.

### ROUND ABOUT JERSEY WITH A CAMERA.

BY J. ANDREWS.

THERE are few more delightful places for a holiday run than the Channel Islands, and to the man weary with town life nothing can be more charming and invigorating than the thorough change of scene, with fresh air, sea breezes, blue seas, green lanes, and rocky bays, which these islands afford. The following remarks will, however, be confined to the island of Jersey, chiefly from a photographer's point of view, as inquiries are continually being made in the photographic papers as to its capabilities for a photographic tour:—

The island of Jersey, the largest of the group, is 133 miles from Southampton and 93 miles from Weymouth, and is within 15 miles of the coast of France, whose white sands may be distinctly seen in clear weather. The most convenient route for Londoners is via Waterloo and Southampton. The mail train leaves London every evening, except Sunday, at 9.45 p.m., and runs alongside the boat at Southampton.

The boats, which are new and very fast, leave at 12 midnight, and are timed to reach Guernsey about 6 a.m., and Jersey at 8 a.m. The fares are moderate: 1st class return, two months, £2 8s.; 2nd class, £1 13s. Travellers from the west of England will probably find the Weymouth route more convenient, and the boats are equally fast and good; the fares are the same as the Southampton boats, but the sea passage is about two hours' shorter. These boats leave Weymouth every morning, except Monday, at 2.30 a.m., and arrive about the same time as the South-Western boats. There is also a boat several times a week from Plymouth direct. In the summer the sea passage is delightful; but in the winter sometimes much delay is occasioned by fogs and gales, but this will not matter to the photographer, as then he will, most probably, be comfortably at home preparing lantern slides.

The approach to Jersey on a fine morning is very beautiful; after leaving Guernsey, and rounding the Corbière lighthouse, the bay of St. Aubins lies before us on the left with villas and terraced gardens, and the town and harbour of St. Heliers will be quickly reached if the tide is favourable. At low tide the passengers are landed in open boats. This is a great inconvenience, especially to invalids.

The photographer must not expect very grand scenery in Jersey, as there are no mountains and no river or lake, but the valleys are very picturesque, and the rocky bays lovely. Beautiful subjects will also be found in the old lanes, but as a rule the trees are not very large, and in many places have been ruthlessly cut down and topped by the farmers, who are entirely devoted to the cultivation of early potatoes. It is much to be regretted that many of the old orchards have thus been destroyed. The island consists nearly entirely of granite and porphyry, and in some places this is overlaid with a slaty schist.

At the west of the island there are large tracks of sandy dunes which have swallowed up many acres of land, and may be still seen advancing in some parts of St. Ouen's bay.

On the east at low tide will be seen great spaces of rocks and pools, whence *vraie*, or "the harvest of the sea," is largely gathered and forms a most valuable manure.

Some admirable subjects may be obtained when this harvest is going on, with rustic figures and carts. The main roads are good and well kept, and the photographic bicyclist will find every accommodation in the way of repairs, etc., in St. Heliers should he unfortunately come to grief. The climate of Jersey is, as a rule, very mild, especially in the winter; snow seldom lies long, and hard frosts are comparatively rare. Last winter, however, was an exception, and the long continued frost has killed all the outdoor geraniums and many other plants which usually flourish here all the year round; the myrtles, the enormous lemon plants, and other shrubs have also suffered severely. In the spring the winds from the north and the east are cold and last till May, but the summer and autumn are beautiful, day after day of cloudless weather succeed each other, and it is seldom too hot, as the heat of the southern sun is tempered by the sea breezes. The actinic power of the sun is very great, much more so than in England, and the photographer will find that slow plates are sufficiently rapid even for snap shots.

We will now suppose our visitor to have escaped the perils of the deep and the clutches of the boatmen and touts on the pier, and to have reached the town of St. Heliers in safety. Here he will find ample choice of hotels, for description of which we must refer him to his Black or Murray. Some of them are very well situated, but a large hotel is being rapidly finished on the Parade, facing the sea, which in point of situation will certainly surpass everything else in St. Heliers. Charges are moderate, and by arrangement visitors can be boarded at about 8s. a day. Seaside lodgings are not very plentiful in the season, but the charges are reasonable; the only seaside lodgings will be found at Havre des Pas, which is a very pleasant suburb. There are also quiet country hotels at Bouley Bay, Rozel, Pontac, and St. Aubins, which is a most picturesque village about five miles from St. Heliers, and here will be found good hotels and excellent lodgings; there is no prettier place than St. Aubins for a quiet stay. St. Heliers is a large town containing some 30,000 inhabitants, the streets are narrow, but the shops are good, and all the necessities of life and a great deal more can be obtained at moderate prices. The visitor should especially notice the harbour, where some good shipping subjects can be secured; the old square, and the memorable scene of Jersey's great battle in 1781, and the spot where "Pierson fell." There is a very fine public library, and the Royal Courts and new States room are worth inspecting. There are a few good street subjects in St. Heliers, but otherwise there is not much to detain the photographer. The parish church is not very interesting, though very old; in fact, there is nothing in the way of architecture in the island, except the ruins of Mont Orgueil Castle, of any importance.

A fine subject or two may be obtained of Elizabeth Castle, especially at low tide at sunset. This old castle has an interesting history. It was here that Charles II. found an asylum, and here Lord Clarendon wrote his history of the Rebellion. A very interesting account of Charles's stay here will be found in Dr. Hoskyns' valuable work, which is compiled from original sources.

The town of St. Heliers is clean and cheerful, and there are many good villas in its environs. The visitor will also find a public park, lawn-tennis ground, a theatre, and many other attractions. There are also several clubs to which strangers properly introduced are readily admitted. There is a capital circulating library, the bathing is good, and there is no duty on tea or tobacco. What more can anyone require? The photographer will say, "How about a dark-room?" Well, Mr. De Faye, photographic chemist, David's Place, can accommodate him in this respect for a small charge, and he also supplies plates of several makers, and other photographic requirements. Jersey also boasts an amateur photographic society (at No. 21, Grove Place), which holds monthly meetings, and arranges excursions during the season. Visitors introduced by any member will be gladly welcomed by the society to their meetings or excursions; the Secretary is Mr. F. W. Toms, 21, Grove Place.

In the season, numerous excursion cars run to all parts of the island, but the photographer will, we think, rather avoid these if he wishes to do good work. There are two short railways—one to Gorey in the east, and the other to St. Aubins and the Corbière in the west; trains run frequently.

The first excursion we propose to the visitor will be to Mont Orgueil Castle, which is easily reached by the Eastern Railway in about half an hour. After leaving St. Heliers the line runs

along the coast, and many pleasant glimpses of old orchards and pastoral scenery will be observed. After passing Grouville, where there is a large common devoted to golf and rifle shooting, the village of Gorey is soon reached. Gorey is an old-world place, and looks in a decaying condition, partly owing to the failure of the oyster beds, which some years ago were most prolific; and we have heard old inhabitants declare that the harbour in those days was crowded with boats, and that the fishery employed upwards of 2,000 persons. It is quiet enough now, but still the old castle rises proudly over the town. It is a grand ruin, and has a most interesting story, full particulars of which will be found in Messrs. Latham and Ansted's volume.

The photographer will find many good subjects here. The best general views are from the end of the pier and also from a sandy bay in the east. The old gateways and the courtyard are also well worth taking, and there are many good bits of old masonry. One or two days may be well spent here, and the visitor should by no means omit to ascend to the top of the tower, where a grand view is to be obtained of a large portion of the island and the white shores of France, and on a clear day the Cathedral of Coutances may be distinctly seen. There is a pleasant walk or drive from Gorey round the coast to Rosal Harbour and Bouley Bay, and some good coast and rock subjects may be secured *en route*. In returning to St. Heliers from Bouley Bay, the pedestrian should avoid the high road and keep to the valley, down which runs a little stream. This route passes through some lovely old lanes and by some pretty cottages. Another good day may be spent at Greve-de-Lecq on the north coast, and the most pleasant way is to drive or walk through St. Peter's Valley, past St. Mary's Church. If the pedestrian takes the Western Railway as far as Millbrook, he will find it a most delightful walk to Greve-de-Lecq. There are many other beautiful valleys, some of which have good mill subjects; the only way is to explore on foot the Val des Vaux, near St. Heliers. The Waterworks Valley, starting from Millbrook, and others will all afford good subjects. From Greve-de-Lecq the coast both ways may be explored, and fine rock subjects will be met with at Plemon; in fact, the whole of the north coast is very rocky and grand. The visitor should take particular notice of the state of the tide, as in some places it rises thirty and forty feet, and many accidents have occurred to incautious travellers.

Another day may be spent at the Corbière Rocks and Lighthouse. The railway runs first to St. Aubins, which is a very picturesque village, and here some good street subjects may be secured. The railway then runs up a very picturesque valley to Don Bridge and the Corbière.

This part of the island consists largely of blown sand, and the district known as the Quenvais is well worth exploring. If the train is left at Don Bridge, a charming walk to St. Ouen's Bay can be taken leaving the rifle butts on the left. In many places the advance of the sand can be observed, and the botanist will find many interesting plants in this district. In early summer in many places the ground is covered with the burnet rose, sea stock, sea holly, and sea poppy, and other plants. St. Ouen's is a magnificent bay, facing the Atlantic, and all this part of the island is wild and suggestive of nature.

At the Corbière lighthouse are some fine rock subjects, but they should be taken early in the day, as they face the west. Returning from the Corbière, the visitor should not omit Beau Port, where some grand rocky pinnacles are to be seen, in some places covered with ivy. A short walk from here will bring us to St. Brelade's Church, the oldest in the island. It is really a beautiful spot, and the church and churchyard are well kept. At St. Brelade's there is a good inn, where weary photographers will find very good accommodation. From here a short walk up a lovely valley will bring us to Don Bridge, where the train will soon take us back to St. Heliers, or the road over the hill to St. Aubins can be taken.

There are many other interesting spots which the visitor should inspect, such as L'Etac at the extreme north-west, where there is a fine pinnacle of rock standing out from the cliff. The Creux de Vis and Bonne Nuit Bay on the north will also repay a visit, and good subjects are to be met with at most of these places.

Independently of photography, the intelligent visitor will find much to interest him in Jersey, whether he be a geologist or botanist or collector of sea-weeds and marine fauna. The old laws and customs of the island are of great interest to the student and the politician can here see Home Rule in actual and success

ful operation. He will not, however, meet with poverty or noisy demonstrations, for the natives of Jersey are a hard-working, prosperous people, and though they dearly prize their own laws and institutions, are thoroughly loyal to the Crown, and the Queen is perhaps dearer to them as the Duchess of Normandy than as Queen of England.

At the time of the potato harvest, in May and June, large numbers of peasants come over from Normandy and Brittany, and some good figure subjects may be obtained; the blue dress and white sleeves and caps of the women are exceedingly picturesque. Lastly we must say a good word for the Jersey cows, which, though they are quiet and gentle creatures, are always tethered; they give the best of milk, and form very admirable adjuncts to the landscape.

The expense of a fortnight in Jersey, including railway and steamboat fares, should not exceed £10, and with economy it may be done for somewhat less. There is a boat every day to Guernsey, and in the season excursions can easily be made to Sark and the adjacent islands.

## The Picture Galleries.

### DUDLEY GALLERY SUMMER EXHIBITION.

By "LOITERER."

At the Egyptian Hall, the Dudley Gallery Art Society is now holding its annual exhibition of water-colours. The encouragement which this society gives to youthful artists cannot fail to be of advantage, although, naturally, certain of the pictures on the walls may truthfully be termed, in the language of Mr. Steerforth's waiting-man, "Young, sir, very young." Taking the pictures in succession, Miss Constance Duke sends a pretty little subject (7) to which a poem by Miss Sarah Doudney forms a title. A clever portrait (26) is sent by Mr. Alfred Tidey. Both "Lallah" (34) and "After the Festival" (43) show skill in flesh-tints on the part of Mr. Edward Tayler. Close to Mr. F. G. Coleridge's admirable view of "Eton College" (39), we find an excellent picture by Mr. Walter Severn of "A Sandy 'Bunker' on the Conway Rinks" (40). The flowers shown by Miss Lucy Varley (41) have a calico appearance. "The Storm Cloud" (47) exhibited by Mr. G. Cockram is very fine. Mr. R. Wane sends an effective picture of "Spanish Head" (60). A clever specimen of impressionistic painting is Mr. H. Goodwin's "A November Moon-rise" (66). Mr. R. A. K. Marshall has a careful piece of work in "An Old Oak" (73). Miss Helen O'Hara, as usual, is worth notice. Her picture of "Morning near the Giant's Causeway" (77) is remarkably natural. "Our Drawing Room" (98) is absolutely mournful. If it exists, why paint a picture of such a room? Another good picture by Mr. H. Goodwin is "Afterglow on the Simplan" (115), which will recall pleasant memories to Alpine visitors. Mr. Albert Goodwin's "Venetian Butterflies Sunning their Wings" (119) is extremely pretty. Miss Morgan's "New Year Ghosts" (123) is suggestive of naval manœuvres in a fog. A wide landscape, brightened by "Gorse in Full Blossom, near Conway" (140), shows Mr. Severn at his best. One can hardly resist smiling at Mr. Terry's "Old Farm Hand" (147), who is decidedly in his "Sunday best." Menta's "Modiste" (166) is clever, and Miss Carlisle's "La Pensatrice" (176) shows careful study. Mr. A. Webb narrowly misses a great success in his picture "When Morning Gilds the Skies" (196). Miss Sarah James has a pretty little sketch "Hesitation" (200). "Lambeth Palace" (209) is good work by Mr. Fred Burgess. An ambitious and admirable picture by Mr. R. A. K. Marshall is "Byways near Abergavenny" (226). Miss Peel's "Petworth" (238) seems lacking in perspective, but is otherwise good. "Grey Boulder and Black Tarn" (252) shows Mr. Percy Dixon to advantage. Two *genre* pictures by Mr. L. Block are extraordinary in clever detail (258, 309). Mr. B. J. M. Donne sends a careful sketch, "On the Marcime of the Miage Glacier" (264). That excellent artist, Mr. L. R. O'Brien, has an interesting subject on "Mont-tuorence Falls" (281). Mr. G. Marks deserves praise for "In the Gloaming" (353), as does Mr. H. N. Steane for "Break, break, break" (403). "From Killiney Hill" (426) is a good landscape by Mr. A. B. Wynne. There are many poor pictures in the exhibition, but also many specimens of good work by promising artists who are rapidly progressing in their profession.

## Apparatus.

### THE "EVER-READY" DARK-ROOM.

WE have recently had the pleasure of examining one of these ingenious dark-rooms manufactured by Messrs. Davenport and Co., of 32, Parkhouse Street, Camberwell, S.E., an illustration of which will be found in our advertisement columns, and we were astonished. The room is 6 ft. 6 in. high, 3 ft. 6 in. wide, and 3 ft. deep, which gives ample room for working without any fear of barking one's elbows. Shelves are provided for bottles, chemicals, and so on, while the developing table is provided with a lead-lined sink, 12 in. by 9 in. by 2 in. deep, with a pipe for waste which can either be discharged outside the dark-room or into a bucket below the sink. Just over the sink is a sliding coloured window which gives ample light in the daytime, and there is a bracket placed outside to carry a lamp at night. This arrangement will be found very convenient for bromide printing, as the window can be pushed aside, the exposure made, the window closed again, and development proceeded with. The four sides of the room, the roof, and the floor are separate, but holes are bored for the screws, and the whole is easily put together. Of course, at the price of 35s it is not to be expected that the room would be painted, it is supplied in planed wood, but any amateur could paint it for himself in an hour. The wonder is how it can be supplied at all for the money, and we hope the makers will have a large sale to repay them for their enterprise. A somewhat superior article, lined with light-tight felt, and fitted with lock and key, is supplied at £2 2s.

### MESSRS. UNDERWOOD'S LONDON DEPOT.

These well-known makers of photographic apparatus have just made an arrangement with Mr. D. R. Duncan, of 186, Fleet St., to become their London agent, and he has on show a good stock of apparatus, including cameras, tripods, lenses, shutters, and so on, which will be found well worth a visit by the intending purchaser. We may mention that all the apparatus sold by Messrs. Underwood is manufactured on their own premises, under their own supervision, and at the present moment they are as busy as they can be. Messrs. Underwood's views of the way business should be done are interesting. They say:—

"We beg to notify that our prices are nett, and that we do not supply our goods to dealers who advertise everything and everybody's goods at discounts. Our prices are very low for the quality supplied, and our trade discount is only sufficient to repay responsible and trustworthy dealers. Trusting that we shall prevent amateurs from being imposed upon..."

One of the standard patterns of camera supplied by the firm is the "Instanto," which, they say, has in it all the movements and conveniences which an operator can desire, either for home,

THE INSTANTO.

studio, or travelling. In it perfect rigidity is combined with the utmost simplicity and portability, loose parts or loose screws being rigidly excluded. The camera has leather bellows, and allows the use of lenses from the shortest focus up to 17 ins. in the half-plate. The body is fixed instantly and rigidly at any part of the baseboard, the focussing being effected by rack and pinion motion of baseboard. It has rising and cross fronts, double swing back, and reversing back. This reversing back is one of the refinements of modern cameras, and has hitherto been confined to the most expensive sorts. By its means the focussing screen, which is provided with double-jointed hinges, can be instantly changed from upright to horizontal, or *vice versa*. The

lens is a first-class achromatic meniscus of the most modern form of construction, and is especially adapted for instantaneous work. It is suitable for portraits, groups, views, etc., and for fineness of definition and covering power is not surpassed by any lenses made. It is fitted with an iris diaphragm, marked in accordance with the standards of the Photographic Society. The shutter is a new patent one, giving "instantaneous or time exposures at will."

An ash tripod, very rigid, is also provided as part of the set. The price for half-plate set is £4 4s.

Another standard form is the "Exhibition," of which the makers say—"This model of camera is the most compact and portable it is possible to make. It permits the use of lenses from the

THE EXHIBITION.

shortest to the longest focus. The front is fixed instantly and rigidly at any part of the baseboard, the focussing being by rack and pinion. The back moves forward along the baseboard for use with very wide-angle lenses. It has leather billows, double swing back, swing front, rising and falling front with novel and superior tightening arrangement, double hinged focussing screen and reversing back, enabling the double back to be altered from vertical to horizontal, or vice versa, in an instant." The camera is fitted with a meniscus lens of good quality, and with the Instantolux shutter. The tripod head is a revolving one and is fixed to the camera, allowing the lens to come through when the camera is shut up. The price for a half-plate is £5 10s.

The "Instantolux" is Messrs. Underwood's well-known roller blind shutter, and is constructed to give either time or instantane-

THE INSTANTOLUX.

ous exposures, the action being very simple. It is a shutter which we can strongly recommend. The shutter is set ready for action by turning knob A round as far as it will go. It will only turn one way, the ratchet preventing it going the other way. For an instantaneous exposure the angle piece set in knob A is turned away from the shutter, as shown at A 2, and a firm pressure on the rubber ball given. For a time exposure the angle piece is turned the other way, as in A 1, and the pointer B set to the slowest. A pressure on the rubber ball being given, the shutter opens, and remains open, whether the rubber ball be pressed or loosed, and is only closed by another pressure of the rubber ball being given. The price for a shutter to fit a 2 in. hood is 18s.

Messrs. Underwood also manufacture several other cheaper but effective forms of shutter, and lenses of various kinds, which they claim to be of good quality and the best finish. They have also several forms of hand-cameras, which can be used with either plates, films, or a roll-holder. We strongly recommend anyone proposing to purchase a set of apparatus to pay a visit to Mr. Duncan before making his decision.

#### THE CLIFFORD CAMERA.

This hand-camera is the invention of Mr. C. Lawrence, of 141, Fulham Palace Road, London, W. The camera contains twelve plates, all of which can be brought into position and exposed in a few seconds. The plate-holder or sheaths are in the form of a book, in filling which you press the corner of plate against a spring until the end of the plate is in the sheath, when the spring will keep in its place. Having filled all the sheaths, "the book" is kept in position by a spring, which also keeps each plate as it is used in register. The action of changing plates is simplicity itself. Three kinds of books are made—one for twelve ordinary plates, one for twenty "Cyclist" plates, and yet another which will hold thirty cut films. These books all occupy the same space. The shutter is most efficient and beautifully made; it is wound up with a key, and is then capable of giving fifty exposures without any further attention. It will give a time exposure of any duration, from a quarter of a second and upwards. The speed of the shutter is stated to be one-fiftieth part of a second. The lens is of fixed focus, giving all things beyond 13 ft. sharp. The quarter-plate is sold for £10 12s., and 5 by 4 for £11 13s., fitted with Taylor, Taylor, and Hobson's D lens with Iris diaphragm.

#### LOMAN'S CAMERAS.

A few weeks since we called attention to the "Reflex" hand-camera made by Messrs. Loman and Co., of Amsterdam. We have within the last week had a call from Mr. Loman, and he has given us an opportunity of thoroughly examining the camera, which we must class excellent. Of course, the great feature in this hand-camera is in the fact that the *exact image thrown by the lens on to the sensitive plate is seen by the operator*. This is not done by any other camera in the market, and alone makes the "Reflex" the most serviceable to artists and others who want to make sure that the plate records the exact picture which the operator sees. These cameras are made in quarter and half plate size, and may be seen at Messrs. Mawson and Swan's London house, 33, Soho Square, W. They are of most excellent workmanship, and have a roller-blind shutter working directly in front of the plate, which will give a time or instantaneous exposure at will.

The firm are makers of all types of cameras, and their "Holland" camera brought out in January of this year will compare favourably with any of the first-class English cameras both in material and workmanship, whilst the price we understand is far lower. This is due to the fact that skilled labour in Holland is obtainable at one-third the price paid to the British workman. Two other cameras will be issued shortly, the "Amsterdam" and the "Stickum." Messrs. Loman and Co. have an ingenious shutter, the "Light Economic," which is on the roller-blind principle, but which works at the back of the camera immediately in front of the plate. It will, of course, be seen that the shutter cuts off no light whatever, and that the plate is exposed all over for the same period of time. This shutter can be fitted to any camera, but it is necessary to send the dark slide to Amsterdam. Other shutters, cameras, tripods, flash-light apparatus, etc., are made and sold by Messrs. Loman, who will be pleased to answer any enquiries,

either through their agents, or if addressed direct by post to Amsterdam.

### THE FRY MANUFACTURING COMPANY.

We recently had a call from Mr. Herbert S. Fry, we believe, the sole partner in this concern, and he mentioned that the firm was ready to meet any demand for cut films, and that pieces of celluloid for focussing screens were kept in stock. It is intended to give a series of lectures and demonstrations, commencing in the autumn and continuing weekly through the winter season. These are really started to teach the beginner; last season we understand there was a good attendance. We believe Messrs. Fry and Co. intend making a speciality of transparency plates on ground glass for stereoscopic work this season. It has often been remarked that if the *mat* of the ground glass were finer, they would be largely used. Those who have not visited the Company's premises at 5, Chandos Street, Strand, W.C., should take an early opportunity of doing so; if for no other purpose than to see the specimens of enlarging on bromide paper.

## Societies' Meetings.

**Bedford.**—The excursion to Sharnbrook on the 10th inst. was well attended, the party including two lady members. The weather was excellent and the pretty river scenery with which the neighbourhood abounds gave plenty of scope for the performance of good work. The President and one of the Secretaries conducted the party, and a very enjoyable afternoon was passed.

**Birkenhead.**—The usual monthly meeting of this association was held on the 11th inst., the President (Mr. G. E. Thompson) occupying the chair. Mr. Alexander Legg was unanimously elected a member. The President gave a paper entitled "Experientia Docet, or Photography in Italy;" this paper was the outcome of his several excursions to the country referred to, and was composed mainly of hints to those contemplating similar photographic trips. Mr. A. W. Beer referred to a recent photographic tour made by himself in company with Mr. J. H. Day in Brittany, during which the two gentlemen exposed between them two gross 10 by 8 films by various makers. Mr. Beer said that while the films were not recommended, even by the makers, for use in such large sizes without a roll-holder, still with the Barnett film-carriers, the results were perfectly satisfactory. As a result of their experience, they had come to the conclusion that while film photography was capable of great improvements, the great saving of weight made it well worthy of careful trial. Mr. Charles Sharp had been announced for a paper entitled "Authors and Artists at Play," but was unfortunately prevented by serious illness; his place was admirably filled, however, by Mr. Clibborn, who at a few hours' notice delivered a most interesting and amusing address on "American Social Life."

**Brighton.**—At the meeting on the 9th inst., Mr. Slingsby Roberts (President) in the chair, a number of members assembled to witness Mr. E. J. Bedford's practical demonstration of "Development by Eikonogen." This developer has undoubtedly many things in its favour, and has become very popular with photographers. Mr. Bedford exemplified the powers of eikonogen by developing bromide paper prints, lantern plates, and also ordinary negatives, good results being obtained in each instance. Mr. Roberts gave an account of the excursion to Bosham on Whit-Monday in conjunction with the Southsea Society. Owing to the inclement weather, the party was but a small one. Some good work, however, was done and a very enjoyable day spent. On June 11th an excursion was held to Danny Park. The next excursion will take place on the 27th inst. (in conjunction with the Lewes Society), when the members will, by kind permission of R. J. Streatfeild, Esq., be enabled to visit "The Rocks."

**Hackney.**—The ordinary meeting was held on the 11th inst., Mr. J. A. Sinclair, Vice-President, in the chair. Mr. J. O. Grant presented the society with twelve books, and was warmly thanked for his donation. Mr. Funston asked what strength should a hypo solution be used. Mr. Hubert said 20 per cent. for prints, but he rather liked a strong bath, though it bleached. Mr. Beckett advised putting a little gold in the bath for weak prints. The chairman liked the Alpha combined bath, as it seemed to bring out density. Messrs. Gosling and Roder showed negatives taken of the sun and the eclipse. From the question box: What is the best hand-camera about £5? The Ideal and Facile were recommended, but the latter was thought preferable by some. The Hon. Sec. advised the purchase of a camera in which dark backs were used, as there was then nothing to go wrong. Mr. Capel asked which were the best plates for a hand-camera? The chairman said that with very rapid plates density was not very easily obtainable. He liked Lumière's and Paget's, but in the former case it was necessary to use hydroquinone or eikonogen, as pyro ammonia did not seem to work well with

them. Mr. Beckett thought more sulphite would make them workable. Mr. McEntee then demonstrated the working of the air-brush. The great ease with which it is used and the results obtained ought to be seen by all photographers. Retouching provide enlargements, worked up, putting in clouds in pictures and on negatives are a few of its achievements. Mr. Herbert Smith then gave a very interesting paper on "Photography and Cycling." He made his paper practical by riding to the meeting place on his machine with a full photographic outfit. The machine he preferred and used was with the pneumatic tyre, a preventive of vibration. He carried his camera and sundries in a suspended arrangement in front of the steering bar. The only disadvantage he suffered from was dust. Mr. Hubert thought glycerine would overcome the difficulty. The chairman observed that there would be a danger of dampness. The excursion last Saturday to Box Hill was well attended, Mr. Hensler acting as leader.

**Harlesden and Willesden.**—The annual meeting of this society was held at the Court House on the 9th inst., the President in the chair. The following were re-elected officers for the coming year:—President, J. Naylor; Treasurer, L. R. Price; Secretary, Isaac Cohen; Council, Messrs. Seed, Clapton, Pay; new members of Council, Messrs. Hocking and Winterton. The Secretary read his annual report, which was of a satisfactory nature. Mr. Naylor read a paper, and practically illustrated it, upon "Exposure and Development," which showed great care in its preparation, and in which Mr. Naylor showed a simplified table of exposures he had made up for the benefit of members, and also gave the members the benefit of his experience about the formulae to use in development, and went thoroughly over the vast ground of his subject.

**Holborn Camera Club.**—A special general meeting of the members of the Club was held on Friday last, Mr. D. R. Lowe (Vice-President) in the chair, to elect a Secretary in the place of Mr. J. E. Smith, who had resigned membership of the club. Mr. Frederick J. Cobb, of 25, Lambeth Road, S.W., was elected to fill the post, and Mr. A. Plumbridge was elected a member of the Committee in the place of Mr. Cobb. The prize given by Mr. T. O. Dear, for the best picture taken at the picnic outing, last month, was awarded to Mr. A. J. Golding, who sent in a very pretty picture of an old cottage. Mr. A. Bell announced that he would give a prize for the best picture taken at the Purfleet outing, and the Chairman said he would also give one for the best picture taken at the London Colney outing on the 28th inst. Twenty-one members, including five ladies, journeyed down to Purfleet on Saturday last, and spent a very enjoyable day there. The members divided the plates in their slides between the annual fair, "botany," and the river (taking shots at some of the vessels outward bound).

**Ipswich.**—This Society, including a contingent of lady members, had a very enjoyable excursion to Coddanham on Saturday, the 13th inst. Plates were exposed on many of the picturesque nooks of this quaint village. The church, with the "Hall" family pew (an enclosed apartment containing a fire-place, etc.), was also visited. A move was afterwards made to Shrubland Park (kindly thrown open by Lord Saumarez), and on returning to Coddanham after tea, a few more negatives were secured, including the inevitable "group."

**Liverpool Camera Club.**—The monthly meeting was held on the 10th inst., the President, C. F. Webb, L.D.S., in the chair, who announced his intention to give two prizes for the best sets of six pictures taken during the monthly outings. Mr. G. Allday was elected a member of the Council, and Messrs. Glassey, E. Hawkins, Allday, W. A. Brown, and J. Hawkins each developed a plate with their own chemicals. Nineteen members were present out of a membership of over thirty. The excursion Committee's arrangements for June include a special outing for members with hand-cameras, besides the usual two outings for the month. A paper on "Photographic Chemistry," by Mr. Joseph Davies, is promised for the meeting on July 8th.

**Lowestoft.**—At the photographic meeting on the 14th inst., Mr. W. Stringfield presiding, on completion of the business, the Rev. A. Wells exhibited some very interesting slides illustrating his travels in Constantinople, Florence, and elsewhere. Mr. Estcourt gave a further instalment of his stereoscopic views of Burnham Beeches, the tone and quality of which were excellent. Mr. A. M. Smith also produced some half-dozen slides, evincing careful work with due appreciation of the artistic.

**Spenn Valley.**—The June meeting of this society was held at the Coffee Tavern on the 9th inst. Dr. Farrow (President) occupied the chair, and there was a fair attendance of members. Mr. J. H. Jackson, photographer, gave an interesting paper on "Cloud Negatives, how to Make and Use them," and at the close a number of Mr. Jackson's lantern slides were exhibited and much admired.

**Sydenham.**—The first excursion of this club was made on the 6th inst., when a good muster of the members met at London Bridge Station, whence they journeyed by train, picking up fresh contingents *en route*. Waddon was reached about three. Mr. George Austin,

taking the party under his guidance, conducted the members through some charming scenery, where many successful exposures were made. At 6.30 the party arrived at the Greyhound Hotel, Carshalton. While waiting for tea the few plates left to the party were exposed on the church, pond, and village street. The 8.15 train landed the members home in good time, well pleased with the afternoon's work. On the following Tuesday evening an ordinary meeting was held at the head-quarters of the club, the President in the chair. The discussion was upon the work done during Saturday's excursion. Some very good prints were shown by Mr. Zimmer; amongst them was a group of the whole party, which was much appreciated by the members. Mr. G. Austin's hand-camera subjects caused some amusement, he having caught several members unawares. Mr. P. Barlow showed some excellent work in Obernetter paper, upon which he was complimented. A large number of prints were passed round, and criticised by members and visitors.

**Stockport.**—The Secretary writes:—Last Wednesday (10th) was our annual meeting and election of officers. We have over 100 members, and start again with a good balance, and two good lanterns (lime and oil) purchased during winter. List of officers: President, Thomas Kay, Esq.; Vice-Presidents, Messrs. W. B. Leigh, W. Banks, G. Hilderley; Hon. Treasurer, F. G. Brookes; Hon. Secretary, Henry J. Robinson (Pittville House, Shaw Heath); Council, Messrs. A. M. Gourley, H. J. Heginbotham, G. H. Broome, Thos. Bedford, C. Dawson, Col. Turner, Oliver Coppock, H. D. F. Dobson, Samuel Kay, A. White, George Ball, junr., and J. Preston.

**Tunbridge Wells.**—The fifty-ninth ordinary meeting of the above association was held on the 11th inst., Mr. Pierson in the chair. Mr. Lewis Hepworth was elected a member. The prints of Scotney Castle, the result of the excursion there, were exhibited and were favourably commented on, after which members viewed the prints which had been sent in for competition to the AMATEUR PHOTOGRAPHER; "Enlargements" and "River Scenery" were the two sets. They proved most interesting and instructive, were well criticised, and lessons were gathered from them, especially by those who were fortunate enough to have received the *Photographic Reporter* before looking them over and seen the official criticisms. Mr. Lewis showed some old wet plates, also some developed with tannin and tannin and honey. Mr. Catchpole kindly lent for inspection some old prints which had been in his possession over thirty-eight years, and had belonged to Sir William Newton, who was portrait painter to Her Majesty at that time and had been manipulated by him. Some were very much faded, others in a good state of preservation. One was from a painting, and represented the christening of, most likely, the Prince of Wales; one was of the wedding of the Queen; and one with the Queen in her robes seated, the Duke of Sussex kneeling and holding her hand, the Duke of Cambridge standing at the back of him, surrounded by her court, including the Duke of Wellington with the Duchess of Sutherland and Lady C. Lennox standing behind the Queen's chair. The others were fine specimens of old trees. These were of more value, as coming after Mr. Prince's lecture of last month, when members were treated to a sight of some very old paper negatives. Mr. Cassingham showed a stereoscopic camera for twelve stereos or twelve quarter-plates or twenty-four lantern plates, which was considered to be the most compact little camera for the purpose yet seen. The pair of lenses fitted could, by a simple contrivance, be used for two pictures or one. It was proposed that some of the excursions should fall on a Wednesday, so that those unable to attend on the Saturday should have an opportunity of participating in the pleasures of the outing.

**Wakefield.**—A ramble was arranged for the 6th inst., to Heath Common and Kirkthorpe. The day being very windy, however, only three members turned up, which is to be regretted, as Kirkthorpe is prettily situated. The only plates exposed were on the interior of the church, good results being obtained by twenty minutes' exposure on Paget's fifty times plates, stop f/32. The following rambles and excursions have been arranged:—Saturday, June 27th, Walton, including Barnsley Canal; train leaves Kirkgate, 12.43 p.m. Saturday, July 18th, Brockdale (by special permission), wagonette 12 noon. Saturday, August 8th, Rostell village and Park, train from Westgate 12.45 p.m. Should the weather on above dates prove unfavourable, the excursion will be postponed until the Saturday following, and if then unfavourable will be abandoned.

**A New Level.**—Messrs. Taylor, Taylor, and Hobson have sent us their No. 5 level, of which they say:—"One of these levels used on the side of a camera swing-back will insure the avoidance of the vertical distortion or leaning, which is often so noticeable in photographs of buildings, etc. Another on the back will insure the true horizontal placing of it." Our opinion of the work turned out by this firm is well known, and the "level" is up to their usual high standard. The price is 1s. 6d.

## Quarterly Examinations in Photography.

**Question 29.**—What are the advantages and disadvantages of dry collodion plates as compared with gelatine dry plates? Give an outline of the dry collodion process.

**ANSWER.**—The advantages of collodion dry plates over gelatine are two—1. Finer division of the particles, and consequently greater delicacy. 2. Greater ease in intensifying if necessary. With gelatine this is uncertain and risky; with collodion certain and safe.

The disadvantages are—1. The bad keeping qualities of collodion plates; after a very few days they appear full of pinholes. 2. The slowness of collodion plates, which makes rapid work impossible.

There are three great branches of the dry collodion process, viz., the bath process, in which the coated plate is dipped in the silver nitrate sensitising solution; and the "washed" and "unwashed" emulsion processes, in both of which the plate is coated with an emulsion previously sensitised. It is, therefore, impossible to give details within the limits of all these processes, specially as in some the silver, and in some the bromide, is in excess. There are some points, however, common to all, and these I give:—

1. The plate must be cleaned with nitric acid or potash.
2. A substratum or edging must be put on of albumen gelatine or india-rubber.
3. The plate is coated and sensitised, or coated with sensitised collodion.
4. When the bath process is used, the free nitrate must be removed by washing.
5. The preservative, which acts as an absorbent of the halogen liberated, such as beer, is applied.
6. The plate is dried, possibly backed, being very translucent, exposed and developed. Details want of space prevents my giving.

R. C. M.

**Question 30.**—Give a brief resumé of the leading iron printing processes.

**ANSWER.**—All iron printing processes depend on one leading principle, viz., the action of light reduces ferric salts to the ferrous state.

1. Sir John Herschel's process: In this, ferrous sulphate is precipitated by ammonia, and the oxide washed by decantation. A saturated solution of citric acid is prepared, and to this is added the oxide. After neutralising with ammonia the solutions are mixed and diluted with an equal quantity of water, when paper is floated on it, which, when dry, is exposed and developed by potassium ferricyanide, being fixed with very dilute hydrochloric acid. This gives blue prints.

2. A modification of this, known as the "blue" printing process: In this the ferric salt, ammonio-citrate of iron, prepared as above, is mixed with potassium ferricyanide, and blue prints are obtained which require no development, but only require to be washed to dissolve out the soluble salts.

3. The platinotype process, which depends on the reduction of ferric oxalate to a ferrous state by light. This is the visible effect we see on exposing the paper to light. In the hot-bath process the ferrous oxalate, when placed in a hot solution of potassic oxalate, reduces the chlorides of platinum to a metallic state. In the cold bath and printing-cut processes the after-effects are different, but so far as these are iron processes the action is the same. R. C. M.

### QUESTIONS.

34. How would you recover platinum residua from papers, etc., as used in photographic processes?
35. How would you intensify a black and white line negative?
36. Are gelatine dry plates to be depended upon for accurate scientific measurements? Give reasons and authorities for your answers.

(Latest day for Answers, June 29th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.

2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.

3. A nom de plume may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

**NOTE.**—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT," AMATEUR PHOTOGRAPHER,  
1, CREED LANE, LONDON, E.C.

## Reviews.

*Handbuch der Photographie für Amateure und Touristen.* By Major G. Pizzighelli. Vol. i., *Die Photographischen Apparate.* 2nd edition. Published by Wilhelm Knapp, Halle a/S. Price 8s.

The author of this work is well known as an authority on photographic matters, and it was only to be expected that a second edition of his practical Handbook should be called for. The volume before us is a handsome and useful book of nearly 500 pages, with over 500 illustrations in the text. The treatment of the subjects is practical and fairly exhaustive, and the very latest information on the leading photographic apparatus is given. The book is divided into seven parts. The first treats of the pinhole camera, and the author gives us a useful table showing the distance of the screen from the aperture, with the correct diameter of the latter. The second part is devoted to the lens, and the leading optical principles involved in the construction and use of the same, and in this part the author gives a very useful summary of the ratio apertures of all the new types of foreign lenses made with the new Jena glass. Part three is devoted to the camera, and the newest types of camera construction are shown, with practical notes on the same. A fairly exhaustive account of the leading shutters and a very complete description, with illustrations, of the foreign hand-cameras, closes this part. In part four we have clear, practical hints on

the choice of camera and lens. Part five is devoted to stereoscopic photography, the principles of double vision, and preparation of stereoscopic images. Part six includes enlarging and reducing apparatus for day and artificial light. Part seven, apparatus for magnesium flash light. Taking the work as a whole, it is well written from the practical standpoint, and forms an excellent handbook to the choice and use of apparatus.

### Honours for Mrs. Grimwood: Enterprise in Journalism.—

Although the Government did not confer the order of the Crown of India upon Mrs. Grimwood, she has received two tributes to her heroism. One, the Royal Red Cross conferred by the Queen; and the other, the Gold Victoria Olive Wreath, which is awarded by the proprietors of the *Gentlewoman* to those who distinguish themselves by some act of womanly devotion. Mrs. Grimwood richly merits both these distinctions.

**Our Competition Photographs.**—The *Essex Herald* of the 16th inst. says: "The *Photographic Reporter*, a monthly illustrated magazine devoted to the advancement of photography, gives in its issue for June a capital colotype reproduction of Mr. Alfred J. Jeffreys' photograph 'A Country Road in Essex,' which secured the bronze medal in the AMATEUR PHOTOGRAPHER's recent 'Inland Scenery' competition. We have had occasion to refer to Mr. Jeffreys' successes in the photographic world before. His latest triumph represents a delightful scene on the road from Chelmsford to Galleywood. The picture is as perfect as it well can be; it is the work of a thorough artist."

## To Correspondents.

THE insertion of QUERIES and ANSWERS is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES

4775. **Cheap Reducer.**—Can anyone recommend a cheap reducer for negatives which have been over-developed?—GADLYS.

4776. **Varnish, how to Remove.**—How can I remove varnish from a negative so as to reduce it?—GADLYS.

4777. **Printing Processes.**—Will some reader tell me know the printing process of Celerotype, Kallitipe, and Pyroxyline papers; whether they are printed out like ordinary silver paper, or developed like bromide paper? Also say what paper is best for an amateur who has not much time on hands for toning, etc., etc.—S. ARMSTRONG.

4778. **Ferro-Prussiate.**—Will some reader say if ferro-prussiate paper can be toned black, like bromide paper? If so, kindly give formulae.—S. ARMSTRONG.

4779. **Angle of Focus.**—Could any advanced amateur photographer inform me the correct angle of focus of a Wray's rapid rectilinear lens (half-plate)? I have tried to find it out myself, and have made it 45 degs.; is this correct? I think it is a thing every amateur photographer ought to know, but I don't.—W. H. ELLIS.

4780. **Broken Negative.**—I shall be much obliged to any reader of the AMATEUR PHOTOGRAPHER who can inform me the best way to print (if possible) from a half-plate negative which is broken into three pieces. If it is not possible to do so, what solution can I make that will take the film off of the broken pieces of

glass, so as to put it on a clean piece of glass.—W. H. ELLIS.

4781. **Varnish, how to Make.**—Could any reader of the AMATEUR PHOTOGRAPHER give me a formula for a good varnish for negatives, also the way to set to work and the price of the formula complete?—W. H. ELLIS.

4782. **Bottles, Cleaning.**—I should be glad of a solution or chemical which will clean bottles which are stained with the following chemicals, viz., hydroquinone, gold toning solution, ammonia '880 degs., and alum.—W. H. ELLIS.

4783. **Quarter Plate Hand-Camera.**—What is the best quarter-plate hand-camera fulfilling the following conditions? (1) size not over 9 by 5 by 5; (2) light weight; (3) holding twelve plates; (4) simple, safe changing system; (5) time or instantaneous exposures; (6) good shutters, varying speed, no vibration; (7) double exposure on plate impossible; (8) first-class rectilinear lens, rotating diaphragms, focusing arrangement, and finders. State maker and price.—W. M.

4784. **Focussing.**—How is it possible, when taking a photograph, to get the background correctly focussed?—J. J.

4785. **Dark Room, Highgate.**—Could anyone, amateur or professional, tell me where I could develop plates, etc., near the Chetwynd Road, Highgate?—G. BARKER.

4786. **Reducing.**—Would any brother amateur kindly tell me of a safe way to "reduce" water in a landscape negative, which prints "chalky"? Have tried spirit without success.—COLONIST.

4787. **Developer for Ilford Plates.**—Would some fellow reader tell me whether this is a good developer for Ilford plates, ordinary? The following is the quantity for developing a quarter-plate:—

Pyrogallie acid	...	...	2 grs.	Freshly
Water	...	...	1 oz.	mixed.
Liquor ammonia	...	...	3 minims.	
Bromide of potassium	...	...	8	

If not, would someone tell me a good one? I want to know the amount to be used in developing a single half-plate.—BEGINNER.

4788. **Lowestoft.**—Am going to Lowestoft very shortly, and shall stay a day or two. I shall take my quarter and half-plate cameras. Will anyone tell me of a few places worth taking, both in town and neighbourhood? Where can Ilford plates be obtained, and which is a good hotel, moderate living? Which of the Ilford plates shall I take for instantaneous views of shipping, using Lancaster's Instantograph? Any hints will be very acceptable.—PERCY. [Note.—See AM: PHOT: (article) August 31st, 1888.—ED.]

4789. **Quarter-Plate.**—Will any of the readers of the AMATEUR PHOTOGRAPHER, who fully understand the subject, kindly inform me what make of quarter-plate camera is the best, and most perfect in all modern improvements and finish, and what lens and shutter are most fitted for all kinds of work? I want a first-rate instrument, and one to which I could have an Eastman's roller fitted; there are so many different makers I feel sorely puzzled from which to buy.—THOS. JAMESON.

## QUERIES UNANSWERED.

May 29.—Nos. 4711, 4728.

June 6.—Nos. 4727, 4729, 4732, 4738, 4740, 4746, 4749, 4750.

„ 13.—Nos. 4767, 4769.

## ANSWERS.

4736. **Exposures.**—1-25th sec. and 1-60th. For taking yourself in a group or in a picture where other figures cannot be got, use the Self-Portrait shutter sold by W. Tylar, Birmingham; price for 2 in. lenses, 5s.; 3 in., 7s. 6d.; or Underwood, also at Birmingham, price 3s. 6d.—PHENIX.

4737. **Quick Printing.**—"X." has been misinformed. He can get his paper at Adams and Co.'s, 81, Aldersgate Street, E.C., either in sheets at 1s. or in packets. Fifty quarter-plate, 1s.; fifty half-plate, 1s. 9d.; also see p. vi. of advertisements in AMATEUR PHOTOGRAPHER for June 12th. The question is answered there.—PHENIX.

4751. **Half-Plate Camera.**—Thornton-Pickard Ruby camera is a good one. Price with three dark slides, £5 17s.; tripod, £1; 7 by 5 Optimus Euryscope, £4 14s.; Thornton-Pickard shutter, time and instantaneous, £1 0s. 6d.; total, £12 11s. 6d. If you get an Optimus R.R. lens it would make about 34s. less, or you might have a 7 by 5 landscape lens, which would make the bill still less.—PHENIX.

4752. **North Wales Tour.**—I am sorry I can give you no information regarding hotels, etc., but I give a list of a few places here. I see you do not include Conway in your list, but I should advise you by all means to visit it; it would be worth going to Wales for this place alone. The chief objects of interest here are the town wall, the castle, a splendid ruin, and from whose walls some capital views may be obtained of the town, bridges, river, etc.; Plas Mawr, an old mansion, with the customary bed upon which Queen Elizabeth slept; the suspension and tubular bridge, and the harbours. At Penmaenmawr you could get some pictures of the quarries, cable railways, etc.; and at Aber, near Llanfairfechan, there is a waterfall. Four miles up the Conway is Tal-y-Cofn, with a charming ferry, and, at low tide, rapids, an otter weir, and other traps may be seen. Four miles further is Trefriw, and up on the left some pine-clad mountains, with a sulphur mine, a hydropathic establishment, and, close by, the famous Llanwrst Bridge. Bettws-y-Coed is about five miles beyond Trefriw. Altogether, it would well repay your trouble to walk from Conway to Bettws. The scenery all up the Conway is beautiful. Up to the right, near Trefriw, is a large wooded mountain, with a large lake on the top, and the scenery is altogether very wild. I should advise you to go to Beaumaris also.—PONTY. [Note.—See AM: PHOT: articles in August 26th, 1887, and June 14th, 1889.—ED.]

4752. **North Wales Tour.**—You will find all round Bettws-y-Coed one of the most delightful places for photographing in, and it may well be called the cream of the Welsh scenery. The Royal Oak Hotel is a favourite one, and David Cox's picture may still be seen there. There is the Waterloo and Gwydr Hotels, but I think you would like the Royal Oak. Not far from the Waterloo Hotel you will come to the bridge, which was built in the time of the battle. Pont-y-Pair, in Bettws, is very beautiful, and you would find at least half a dozen pretty pictures round here. Do not miss either the Conway Falls or the Fairy Glen, both extremely beautiful. The Lledr Valley and Pandy Mill are very interesting, especially up the Lledr Valley, where you will come to Pont-y-Pant, and find a picturesque old bridge across the waterfall. The Miners' Bridge and Swallow Waterfalls are both within easy walking distance from any of the hotels. Aberglaslyn is very grand, and you will find endless beau-

4774. **Exposure.**—I used to go by the table on tiful bits for photographing, the Bridge at Pont Aber-glaslyn, and round it. The Goat Hotel at Bedd Gelert is a very comfortable one, and not far from it you may come across an old lady in Welsh costume, knitting. She was there last August and would make an interesting picture. The sight at Llangollen of water is one never to be forgotten, with the lovely stone bridge across, which comes upon you so suddenly. I was not able to take a photograph of it, as the train only stopped about two minutes there, but if you go that way I should advise you to rig up your camera in the train and take a snap-shot. The "Gossiping Guide to Wales," price 1s., will give you information on almost every part of North Wales.—A LOVER OF WALES.

4753. **Green Colour on Negatives.**—Insufficient fixing, or you expose to light before thoroughly fixed.—PONT0.

4758. **Green Colour on Negatives.**—I think "H. M. D." must have forgotten to put the negative in water after developing.—W. H. ELLIS.

4753. **Green Colour on Negatives.**—Probably green fog, caused by ammonia developer. Try using soda or potash as the alkali, or ferrous oxalate developer as a preventive. For a remedy, use the following:

Ferric chloride . . . . . 50 gr.  
Potassium bromide . . . . . 80 "  
Distilled water . . . . . 4 oz.

Soak negative in this for a minute or two, when fog will disappear and density be reduced; rinse well, and apply a ferrous oxalate developer till required density is attained. Refix and wash.—PEN.

4754. **Spots and Faded Prints.**—Methylated spirit will do no harm, but I should fight shy of carbolic acid.—PONT0.

4754. **Spots and Faded Prints.**—Carbolic acid and methylated spirit are so much used in mountants that I expect they do not spot and fade prints.—PHENIX.

4754. **Spots and Faded Prints.**—Methylated spirit will do no harm whatever in mountant, but you must only use a drop or two of carbolic acid.—PEN.

4754. **Spots and Faded Prints.**—Methylated spirit will do no harm, nor will a little carbolic acid, and a very minute quantity will be sufficient.—R. A. R. BENNETT.

4755. **Early Morning Photography.**—I suppose Lancaster's Instantograph lens would behave the same between 6 a.m. and 7 a.m., as any other lens at the same aperture. As to the exposure, it is impossible to say, unless you give the nature of the subject. Make a few experiments, and get an exposure table. If you use Thomas's plates, there is a table on the box.—PONT0.

4755. **Early Morning Photography.**—I think "W. F." will find that Lancaster's Instantograph camera will answer his purpose for early morning photography; exposure and stop is a question of light and object he is taking. If he is taking a landscape with the sun shining, stop f/22 and about 2 seconds exposure would do; if taking a building in a dull light, stop f/11 and 10 seconds exposure; if the sun is shining or a very bright light, stop f/22 and 2 seconds exposure. Why not buy "The Photographer's Systematic Exposure Note-book," price 1s., to be obtained at any photographic material dealer's?—W. H. ELLIS.

4756. **Bettws-y-Coed.**—You will find Bettws-y-Coed a most delightful place for photography, and you will do well to take plenty of plates. Mr. Parry, chemist, has a dark-room and sells photographic materials, I think. The Conway Falls are very grand and about three miles from Bettws, also the Fairy Glen and Pandly Mill, all well worth photographing. The Miner's Bridge and Swallow Waterfalls are a very short distance from any of the hotels. Up the Lledr Valley to Pont-y-pant it is extremely beautiful; indeed, you will find it difficult to come across anything that is not lovely there. Pont-y-pair Bridge and all round it is very interesting. Buy the "Gossiping Guide to Wales," 1s. You will find endless information in it, besides several sketches of the different places.—A LOVER OF WALES.

4757. **Developer.**—As a rule you cannot do better than stick to the formulae sent out with plates. You can easily get your chemist to make up any formula for you. But why be afraid of a little trouble?—PHENIX.

4757. **Developer.**—Ilford plates have many admirers and some detractors. Why change if you are doing well? I prefer Paget xxx. I was never pleased with ready-made developer since I began to mix my own. The developer recommended by the maker of the plate is generally the best for that brand.—PHOS.

4757. **Developer.**—If "D. G. H." has not tried Lockyer's hydroquinone developer I should advise him to do so, as I have found it suits most other makes of plates of each rapidity, and it brings out the details always if exposure, etc., be correct. It costs 1s. 8d. per half pint and 2s. per pint, and can only be obtained at the manufacturer's, Lockyer, 83, Evelyn Street, Deptford, S.E., and of two special agents, viz., W. Edwards and Son, 157, Queen Victoria Street, E.C., and J. Fallowfield, Lower Marsh, Lambeth, S.E.—W. H. ELLIS.

4758. **Printing.**—On page viii. of AMATEUR PHOTOGRAPHER, June 12, you will find three printers advertised. One of these will surely suit you. You should keep your eyes open.—PHENIX.

4759. **Half-Plate Camera.**—As you evidently require a first-class outfit, I would strongly advise you to get a list from J. Billcliffe and Sons, Richmond Street, Chorlton-on-Medlock, Manchester, who makes one of the very best finished cameras in the market, having all the latest movements, swing-back, rising front and turntable head. They can supply you with a first-class tripod, four-fold, and a case (waterproof) to hold camera, three double backs, stops, lens, focussing cloth, and tripod. The whole outfit will not cost more than the sum you are prepared to give, and a better made set you cannot find.—ONE WHO USES THE MAKE NAMED.

4760. **Distilled Water.**—Filtered rain water will do just as well, without boiling. If you boil ordinary tap water for half an hour and allow to cool, it will also answer.—PEN.

4760. **Distilled Water.**—In answer to "Country Cousin's" query, I should think he could not do better than get the Champion still, which costs complete only 8s. 3d., and is always useful for distilling water. It can be obtained at most photographic dealers.—W. H. ELLIS.

4760. **Distilled Water.**—Concentrated solution ought, if possible, to be made with distilled water. Rain, collected at the end of a heavy shower, comes next in the order of purity. Melted snow (when that can be had), is said to be extremely pure. If hard water be used, it should be boiled several times, in different vessels, and filtered through white blotting paper. Straining through muslin is not very effective; cotton wool is better.—PHOS.

4761. **Hintokinone.**—The best way to use the above developer is to have two trays, one containing 1 part developer to 9 parts water, and the other 1 part to 18 parts water; put into the weaker solution first, and if it shows signs of over-exposure, finish it in that; if not, finish in the stronger solution. I prefer a two-fluid developer myself.—PONT0.

4762. **Alum, Before or After Fixing.**—Not before fixing with quinol, as the alum sometimes leaves unpleasant dark patches on the plate.—PHENIX.

4763. **Masks and Discs.**—A vignette glass is usually used. Cost about 1s. 6d.—PONT0.

4764. **Toning.**—In reply to John Boughey's query, I think the toning bath which I described in my answer to Query No. 4722 will suit most double albumenised sensitised papers that are made. The best way to make sure of this fact is to write to the manufacturer of the paper or to the dealer of whom you purchased it. I have never used any other toning bath but that I have stated, and I know I have used several kinds of paper (albumenised).—W. H. ELLIS.

4765. **Rochester and Chatham.**—Rochester Castle, Chatham Harbour, etc., and perhaps you could get admission to the Naval Dockyard. See AMATEUR PHOTOGRAPHER, answer 3957, July 11th, 1890.—PONT0.

4766. **Blackening Slides.**—I should advise "A. D. F." to try Bate's blacking for metal dark slides.—W. H. ELLIS.

4768. **Eikonogen Formula.**—  
Eikonogen . . . . . 4 gr.  
Sodium sulphite . . . . . 32 "  
Lithium carbonate . . . . . 2 "  
Water . . . . . 1 oz.

Perhaps this may want further diluting.—PHENIX.

4768. **Eikonogen Formula.**—Try this:  
Sodium sulphite . . . . . 5 parts.  
Carbonate of potassium . . . . . 2 "  
Eikonogen . . . . . 1 "  
Boiling distilled water . . . . . 3j

Soak the paper after exposure in 4 parts of water, and when limp add 1 part of the above; if the image hangs fire, add more solution. Do not use bromide. After developing, wash well and place in an alum bath for several minutes, then again wash and fix.—PEN.

4770. **Enlarging.**—Easily done, but takes too much space to explain here. Get Wall's "Dictionary of Photography," where all your queries are answered.—PEN.

4771. **Lantern Plates.**—See answer to Query No. 4753 this week.—PEN.

4772. **Blisters.**—Try a saturated solution of common salt after fixing; or a bath of methylated spirit. If these fail, change your brand of paper.—PEN.

4772. **Blisters.**—In answer to "Scribo," it is rather difficult to say the best way to prevent prints from blistering. He must have had the various baths warm and then put the prints into cold water, which caused the prints to blister. Read the first part of my answer to Query 4722 in the AMATEUR PHOTOGRAPHER of June 5th, 1891, or put the prints into a weak solution of Epsom salts before developing.—W. H. ELLIS.

4773. **Instantaneous Work.**—I should advise "Scribo" to use the Barnet plates, rapid, for instantaneous work.—W. H. ELLIS.

4773. **Instantaneous Work.**—I should recommend Mawson plates or Paget's xxxxxx. You will want a good strong light if you use the Instantograph single lens.—PAN.

4773. **Instantaneous Work.**—Try Thomas's extra-rapid, Paget's, or Monckhoven's, which are sold by Negretti and Zambra, and are as good as any I have ever used.—PONT0.

4773. **Instantaneous Work.**—A matter of choice entirely. I should use either Thomas's extra-rapid, Marion's Britannia Special Rapid, Paget Prize, or Barnet. If you like Ilford, and get good results with them, why not stick to their Extra-Rapid brand?—R. A. R. BENNETT.

Thomas's plate boxes. Get an empty box. For the view you mention I should give about 4 secs.—PONT0.

4774. **Exposure.**—My advice is, get Wormald's tables (from A. R. Wormald and Co., 82, Bishopsgate Within, E.C.), which are as good as any, and stick to them.—R. A. R. BENNETT.

4774. **Exposure.**—As far as I know about exposure, I should think Burton is the most correct of the three. If you have not got the "Photographer's Systematic Exposure Note-book," which costs 1s., and can be had at any photographic dealer's, I think you could not do better than get one. I have found that when I go by this book the exposure generally turns out correct.—W. H. ELLIS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us before TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

E. H. K.—Flood the plate with the solution o quinol to which you have added half a grain of bromide of potassium for every ounce of solution, then add one-fourth of the usual quantity of accelerator and allow to act for one minute; if nothing, or only the high lights appear, add another quantum of alkali and allow development to proceed as far as it will, adding still more alkali if required.

G.—(1) The A lens is as good a lens as one can wish to use. (2) We consider A quite equal to B. (3) None better than A. (4) We should prefer the 10 in., or if your doublet is 8 in., try a 11 or 12 in. lens. (5) The exposure for a Swiss landscape depends to a great extent upon the foreground; if you have a mass of dark pines or a dark rock in the foreground, you must expose for the dark foreground, and totally disregard the bright snowy distance. In developing, commence development with about 1-10th of a grain of pyro to the ounce, three minims of ammonia, three grains of bromide; allow this to act on the plate till the detail shows, then add another 1-10th grain of pyro, and continue development till nothing more can be coaxed out; then pour away your developer and apply fresh solution strong in pyro and bromide to gain density. It is necessary for good results to use a thickly coated rich-in-silver plate and perfectly orthochromatic.

H. I. C.—We have stripped the gelatine from your film, and find that the celluloid can be made perfectly clean, most of the peculiar markings being in the gelatine, and they are doubtless caused by insufficient washing between the alum and hypo bath, and consequent decomposition of the latter; or to precipitation of hydrate of aluminium in the alum bath by the alkali of the developer. Wash the films well before putting into alum, and then thoroughly before putting into the hypo.

R. DUDLEY TUCKER—Letter by post.  
H. H.—Send us a print with stamped envelope, and we will reply by post.

KID.—We have seen the slides and have found them to be well made and perfectly light tight.

LEO.—If you want a cheap half-plate portrait lens you cannot do better than buy one of Hookin, Wilson, and Co.'s "Desideratum" lenses. See advertisement AM: PHOT: June 12.

JOE CHAMBERLAIN.—Shall be pleased to see you and the prints.

MCGINTY.—If they have not taken prizes, and conform to the conditions of our "Photography at Home" Competition, they will be eligible.

E. P.—Will probably write you.

R. GORDON.—We are writing to you.

J. C. M.—Why not send an advertisement, as other firms who print from amateurs' negatives?

SERGEANT BEAL.—Your negatives were smashed when received by us.

A. J. LEESON.—Will look up MS. and send you.

CHARLES STEWART.—Call on Messrs. McGhie and Co., 75, St. Vincent Street, or Messrs. Geo. Mason and Co., 180, Sauchiehall Street, Glasgow; we are sure they will help you.

W. H. ELLIS.—Many thanks for correction.

JOHN J. HENSMAN.—Photograph duly received, for which many thanks.

BACCARAT.—No complaints have reached us, there should be no reason for the emulsion washing off. "Celerotype" is made white as well as tinted.

R. C. H.—Two books will help you: "Dictionary of Photography," by E. J. Wall (2s. 6d.), and "Amateur Photographer's Annual" (1s., cloth, 1s. 6d.).

C. E. F.—Use Celluloid. You can get it from Fitch, or Brixton, or Fry and Co., Chandos Street, W.C.

D. CARTER.—We do not know anything about your camera being out of order; as far as we know, it was in good condition when it left us.

J. K. F.—(1) Too dense; have you not intensified this? As a picture it is excellent. (2) This gives us the impression of not being a photograph from nature, but a copy of a drawing, or something of that kind; it is about right in density. (3) Under-exposed and under-developed. (4) A little too thin. (5) Good, just right. (6) Good. Shall we return you the slides?

We should like to have a No. 1 slide, not quite so dense though. We shall be pleased to develop two negatives for you if you forward the same with full details as to lens, exposure, plate, and subject.

**TRITON.**—(1) The subject is well chosen and fairly well developed, but a little more contrast would be an improvement; the print is a little flat but well printed and toned. You should try matt-surface Celero-type or Obernetter paper, white, which would improve this, just giving you the requisite sparkle. (2) The negative is hard, due to improper development. You had black coats and white dresses, consequently you should have reduced the pyro and bromide so as to keep down the density of the whites. The print is covered with millions of cracks, due to allowing the albumen side to curl in when drying. (3) Good. (4) Good. (5) Very fair; your print shows dirty streaks in the sky, probably due to the mount, or have you been blocking out the sky? if so, and we think this is the case, you have not done it carefully enough. (6) Good. The array of soles and hobnails in the front is a little distracting; the feet of most of the little tots should have been tucked away. (7) Very good. (8) Good. (9) Flat; see note to 1. The bright water foreground wants breaking up. (10) The right-hand half of this print looks as though it had shifted in printing, otherwise good. (10) Poor. We think you ought to stand a chance in some of our competitions. You are making a mistake to change from lamplight to daylight. Write to Benham and Froud, Chandos Street, Charing Cross, and ask them to send you some of the orange glass they use in their Perfection candle lamp; two thicknesses of this is quite safe, and you would not want more than one pane glazed; the others should be temporarily blocked out with opaque material. Always pleased to help you.

**MOOREE.**—You are using the wrong plates for black and white work. See our leader next week. With regard to shutter work, it depends entirely upon speed of moving object; but about  $f/11$  and  $\frac{1}{2}$  of a second ought to be quick enough for most street work.

**DUTCHMAN.**—(1) Yes, we should certainly advise you to get a wide-angle. (2) You might obtain one of Hockins' Desideratum lenses, which are good lenses. See our advertisement pages. (3) The price of this lens is too low.

**GADLYS.**—You do not give us the focus of lens, nor distance of man; let us have these data, and we will write you privately, and send answer to your query and the formula you ask for.

**LEWON.**—We are sorry we misunderstood you. Can you tell us where the plates were obtained, or let us see a negative and the original box they were in, when we will try and help you further?

**ALLEGRO.**—We are always pleased to see work, both good and bad, and give you what you ask for now. (1) A little too panoramic. (2) Very fair. (3) Poor; the water in front should have been broken up by a boat. (4) Good. (5) The best; an exceedingly well chosen bit. These remarks apply to the artistic qualities of your prints, but, in consequence of your printing every one in the sun, you have so handicapped your work that we can say nothing as to the technical qualities. If you like to send us another batch, not printed in the sun, we shall be pleased to pick holes in your technical work. Possibly you might work well, but every print you have now sent is flat and poor, wanting in pluck and contrast, and only fit for the waste paper basket.

**F. J. W.**—Please let us know what brand of paper, and the exact method of your working.

**CAB. PHOTO.**—Pyro, 1 oz.; sodium sulphite, 4 oz.; liquid ammon. fort. .880, 2 oz.; pure carbonate of soda, 4 oz.; hyposulphite of soda,  $\frac{7}{8}$ ; alum, 4 oz.; citric, 1 oz.; chloride of gold, 15 grain tube; acetate of soda or borax, 1 oz. These are sufficient for ordinary amateur work for negatives and silver printing. If you want to do bromide, platinumotype, or lantern work, a few more would be needed, and we will give you list if you let us know. We are presuming you require the chemicals as an amateur only; if wrong, let us know.

**NOVICE (co. Tipperary).**—Letter by post.

**G. H. SUTCLIFFE.**—Your advertisement is repeated under "Sale and Exchange." It was inadvertently inserted in the "Wanted" column.

**F. READ.**—We have written to you.

**RACHOLA.**—Reply next week.

**FRED DAVIS.**—Too late for this week, will appear next. Many thanks.

**S. ARMSTRONG.**—The following calculations answer your questions: (1) Supposing the horse moves at the rate of 15 miles per hour, it will move 22 ft. per second, then—

$$240, \text{ distance in ins. } \div (8\frac{1}{2} \times 100) = 240 \div 850 = \frac{24}{85} = .282$$

$$264, \text{ speed per sec. } \div \frac{24}{85} = \frac{204 \times 85}{24} = 935.$$

$\therefore$  the shutter must work at  $\frac{1}{935}$  of a second to give a sharp image.

In the case of the train going at 80 miles an hour at the same distance the shutter must obviously work at  $\frac{1}{1168}$  of a second. You do not tell us what shutter you are using, but presuming that you know the fastest speed of your shutter, the following little rule will give you the distance to place your camera to obtain a sharp focus: Multiply 100 times the focus of the lens in inches by the space through which the object would pass during the exposure, and the result is the distance in inches between lens and camera. (2) The first two lenses you name are equal in merit, but the third lens is much inferior.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, 14, 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the sender to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, 14, 1, Creed Lane, Ludgate Hill, London, E.C. A nominal charge of 1s. is made whether a sale is effected or not.

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.

**Bicycles.**—Bicycle, Facile safety, good condition, lamp, bell, all accessories; £8.—Webb, 123, Rushmore Road, Clapton.

48 in. bicycle, in fair condition, brake to back wheel, would suit learner; will exchange for good half-plate R.R. lens; state maker. — James Randles, Bridge Street, New Mills.

**Cameras, etc.**—Sands and Hunter's 5 by 4 Exhibition camera, with three double backs, quarter-plate carriers, lock case, splendid condition; £3 10s.—Tyson, 12, Halcyon Road, Birkenhead.

Whole-plate camera, three slides, tripod stand (very strong), two fronts, in splendid order, almost new; £6 only; approval of Editor. — H. Holt, Conservative Club, Liverpool.

**Cameras, Lenses, etc.**—Cameras, 6½ by 4½, five double slides, removable partition for stereos, pair 5 by 4 R.R. lenses, £4; pair compound stereo lenses, working  $f/4$ , 25s.; Marion's Academy camera, for twelve 14 in. plates, cost 50s., sell 10s. — Collins, Chalfont, Slough, Bucks.

Whole-plate Exhibition camera, three double backs, Ross' rapid symmetrical lens, quite new; offers?—Camera, Heyside, Royton, Lancs.

Half-plate 1891 Lancaster's Instantograph camera, R.R. lens, stops, shutter, two double slides, tripod, leather case. — Harry Walker, Thomas Street, Heckmondwike.

Lancaster's Special 1891 brass-bound quarter-plate Instantograph, three double backs, best lens, iris diaphragm, new pattern, See-Saw shutter, complete in case with lock, tripod, etc., cost £4 1s. 6d., price £3, quite new; printing frames, dishes, lamp, plates, paper measures, chemicals, etc., all new, £1, the lot £3 10s. — Edwin A. G. Jewitt, Matlock, Derbyshire.

Quarter-plate camera, lens, double dark-slide, tripod; 12s.; a bargain. — J. Lister, 102, Western Road, Jarrow.

Quarter-plate Merveilleux camera, lens, two double slides and stand, and 150 numbers AMATEUR PHOTOGRAPHER; will exchange for half-plate 1891 Instantograph, with three double slides, no lens; will give a little cash. — Graham, New Lanark.

Bargain, Meagher's half-plate improved portable bellows camera, with three double backs, double swing-back, reversing back, etc., all brass-bound, and in solid leather case, with lock and keys, tripod stand in separate case, also Dallmeyer's 6 by 5 rapid rectilinear lens, with iris diaphragm, fitted to above; the lot £12 10s., all new. — C. Hornby Villa, Hoylake, Birkenhead.

Camera, whole-plate, square, leather bellows, folding tailboard, Grubb's lens, tripod; no rubbish; cash offers. — Sansome, 4, South Beach, Blackpool.

Lancaster's quarter-plate Instantograph, cost £2 2s. last December, complete with lens, shutter, double slide, tripod; price 30s., or nearest offer. — Gilkes, Albion Square, Cheltenham.

Tourists' 5 by 4 mahogany double extension camera, swing-back, rising front, three double solid slides, Lancaster's Iris lens and shutter, good as new; lowest

price 48s.; bargain. — L., 93, Florence Road, Finsbury Park, N.

Half-plate Instantograph, complete, £3. Wanted, good make 7 by 5 Euryscope or R.R. lens. — W. Brown, East View, Chorley, Lancashire.

Marion's 5 by 4 camera, two double slides, R.R. lens, and sliding tripod; 23s.; or sell separately. — Camera, 48, Guilford Street, Russell Square.

**Hand-Cameras, etc.**—No. 1 Kodak, with spool, 100 exposures, original, and only just removed, altogether equal to new, one costing five guineas; accept half price. — Delia, care of AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

## OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

Members of the Editing staff are "At Home" on Monday afternoons from Two till Five o'clock, and they will gladly give advice upon all photographic matters.

OUR VIEWS.—"Public Schools" Competition Awards—New Features in AMATEUR PHOTOGRAPHER—"Photographic Procedure," by E. J. Wall—A Weekly Illustration—Holiday Resorts and Photographic Haunts—The Society of Arts' Silver Medal awarded to Messrs. Green, Cross and Bevan—Quarterly Examinations—The wide-spread support of AMATEUR PHOTOGRAPHER Monthly Competitions—The "Hayfield" Competition—Vienna Exhibition—The Camera Club—Index to Standard Photographs—Bacteriology and Photography—The London Figaro states that the Grand Duke Michael intends to practise as a photographer—Some proposed Improvements in Cameras of the Tourist type—The Birmingham Daily Gazette upon photographic matters and the illustrations in the Photographic Reporter—The Scottish Postal Photographic Club.

LEADER.—Copying, Black and White.

LETTERS.—Is Photography a Fine Art? (Fred Davis)—Perspective Drawing and Vision (H. Maclean)—An Explanation (Sol)—Glasgow International Exhibition (Wm. Goodwin)—Exhibition at the Camera Club (G. Davison).

COMMUNICATED ARTICLES.—Composition, and Light and Shade (Robinson)—Chemistry for Photographers (Bothamley)—With a Camera in Austro-Hungary (Yankee Sunflower).

POEM.—Retouching.

THE PICTURE GALLERIES, ETC.—Two Brilliant Conversazioni.

NOTES.—From Edinburgh.

QUARTERLY EXAMINATIONS.

DARK-ROOMS.

SOCIETIES' MEETINGS.—Ashton-under-Lyne — Bedford — Dewsbury — Dorset — East London — Faversham — Glenalmond — Holborn — Jersey — Lewisham — Lowestoft and District — Newcastle-on-Tyne — North London — Photographic Society — Richmond — Southport Social.

It is with very great pleasure that we announce the awards in the AMATEUR PHOTOGRAPHER first "Public Schools Competition," which it will be remembered was open to boys under seventeen years of age. The number of boys entering the Competition was fifty-two, and as all the competitors had to be *at school* we are extremely well satisfied. The prizes, Silver and Bronze Medals and Certificate in each class, have been awarded as follows:—

### CLASS I.—LANDSCAPE.

*First Prize.*—C. A. Brightman (Bristol). A well chosen view, "A Spring Morning, Westbury-on-Trym."

*Second Prize.*—A. C. Newett (Rossall). A carefully selected view of "Colin Glen."

*Third Prize.*—A. C. Ellis (Haverstock Hill). A half-plate view of "The Viaduct, Hampstead Heath."

### CLASS II.—PORTRAITS, INCLUDING GROUPS.

*First Prize.*—Alfred Russell (Grays Thurrock). A well lighted and posed portrait of "Mr. Coates."

*Second Prize.*—Frank Gill (Keighley). An admirably grouped picture, "Repairing the Rent."

*Third Prize.*—A. F. Forrester (Polmont, N.B.). A fairly composed group, "A Gymnastic Class."

### CLASS III.—ANIMALS.

*First Prize.*—Herbert C. Holden (Giggleswick). A capital portrait of a boy and donkey, "A Morning Ride."

*Second Prize.*—A. C. Ellis (Highgate). A portrait of a horse with a dog on his back, "Punch and his Rider Jack."

*Third Prize.*—A. B. Knight (Haileybury). A pretty landscape, with cattle in the foreground, "Animals, Dorking."

### CLASS IV.—ARCHITECTURE.

*First Prize.*—T. S. Cooper (Rossall). A very well chosen view of "Conway Castle."

*Second Prize.*—C. A. Brightman (Bristol). An admirable photograph of "The Cloisters, Gloucester Cathedral."

*Third Prize.*—A. S. Cachemaille (Oldham). Photograph showing the "Interior of Oldham Church, looking West."

The photographs will be on exhibit at our offices from Monday the 29th inst., to Tuesday the 7th of July; after which date the whole of the prints will be loaned to schools, carriage to be paid one way, a packing fee of one shilling with each application. At least two optional dates must be given when applying for the loan of the photographs.

The next boys' competition will be open to *all comers under seventeen, whether at school or not*; the date for photographs to be received is fixed for the 8th of October.

We would thank masters of schools who have taken such an interest in this "Boys' Competition," and we only hope that in our next competition we may have even better work and more competitors. The "boys" will have something to do during the holidays. No doubt the day is not far distant when we may promote a competition for "our girls," who will run the boys hard, especially in the selection of subject.

Some of the photographs show carelessness in development of the negative and in the operations of printing and mounting, but all go to prove that boys under seventeen are fully alive to the beauties of Nature and the usefulness of photography.

NEXT week's issue will commence Vol. XIV. of the AMATEUR PHOTOGRAPHER. Two new features will be commenced, *i.e.*, an illustration will be given every week, and a series of useful articles entitled "Photographic Procedure for the Amateur Photographer," by E. J. Wall, the author

of the "Dictionary of Photography." These articles will form a complete vade-mecum for the photographer, and will be of great service to those just taking up photography, and most handy for reference by all practising the art. We have every confidence that they will be more popular than any "guide to photography" yet published.

It has been again suggested that we should publish "Holiday Resorts and Photographic Haunts" in book form. This has often been under consideration, but we have felt that at present the ground has not been sufficiently covered. More particularly is this the case with reference to "Rambles with the Camera" in the outskirts of London and many of the large provincial towns. We would ask our subscribers to look down the "Tourist Index" published in the AMATEUR PHOTOGRAPHER, and help us by sending in MSS. to make it more complete. We shall then be able to take seriously into consideration the question of publishing "Holiday Resorts and Photographic Haunts" in book form. Many members of our larger photographic societies have taken part in excursions, and could prepare short articles of from 500 to 1,000 words, which would help us very much, and they would in addition earn the gratitude of their fellow-workers.

We are pleased to note that the Council of the Society of Arts have awarded Messrs. A. G. Green, C. F. Cross, and E. J. Bevan the Society's silver medal for the paper contributed by them on "Photography in Aniline Dyes."

THE Quarterly Examinations will be discontinued until the 1st of October. We find that few of the students can give up time during the summer months for examination work. We shall hope to be able to publish a syllabus for the term, so that those entering may have more time to prepare their answers and to carry out the practical part of the examinations.

It is most gratifying to us to find photographs from Melbourne, King William's Town, Cape Colony, and Assam entered for the AMATEUR PHOTOGRAPHER Monthly Competition, July 1st, "Out-of-door Figure Subjects, Groups, etc." These entries prove how wide is the interest taken in our competitions, and we are sure that many appreciate very much the criticisms in the *Photographic Reporter*. The competitor from Melbourne writes:—"I have now been following up photography for three years, and take great interest in anything appertaining to the same."

We would remind our readers that one of the most successful monthly competitions we ever had was the "Hayfield." This year the competition is fixed for the 1st of August, and we hope many scores of our readers will send in photographs of scenes in the hayfield. In many parts hay is now being cut, so we throw out a hint not to forget the "Hayfield" competition.

VERY shortly we shall hope to publish a critique upon the photographs at the Vienna Exhibition. Our contemporaries have all been supplied, and have published an article upon the exhibition, sent them by the direction of the "Club der Amateur Photographen in Wien." This circular article was not sent to us, nor had we been favoured with a copy of the catalogue until this week, when a subscriber was good enough to forward one to us. From a rather close perusal of it we find "our familiar friends" figure well. Hardly any new work seems to have been sent from England, and we note that out of some 170 to 180

exhibitors the United Kingdom contribute 55, who sent 176 pictures. Mr. George Davison has the premier show with 18; Mr. H. P. Robinson, 14; Mr. F. M. Sutcliffe, 12; Mr. Harry Tolley, 11; Mr. Lyd. Sawyer, 8. It will be seen that these five exhibitors contribute more than one-third of the pictures sent from this country. We are, of course, anxious to know from independent sources how the English work compares with the Austrian, which, we understand, is not infrequently assisted by professional photographers.

We do hope that the time will come when the Camera Club may see their way to invite photographers to contribute to a photographic exhibition in which all the work shall be new, and which may be conducted upon the lines of, say, the Royal Academy or any other of the greater annual picture exhibitions, and where the rule of selection shall be strictly adhered to. It appears to us that at Vienna the rule of reputation has been chiefly acted upon; it would at least be interesting to know whose photographs were refused by the "jury of selection," and an exhibition of the rejected English photographs might teach us "terrible things."

THE "Index to Standard Photographs, etc.," ably edited by Mr. H. Snowden Ward, and issued by the *Review of Reviews*, has run well-nigh through the second edition. We understand that the *Review of Reviews* will, commencing July, devote a page monthly to an index of the artistic, scientific, and educational photographs published during the month.

THOUSANDS of our readers have had the opportunity of seeing the AMATEUR PHOTOGRAPHER 1890 Prize Slides. We shall be grateful to any who may be able to offer us suggestions as to the framing of conditions for the 1891 Competition. We particularly wish competitors to keep in view the public exhibition of the prize slides. The more interesting the different series are made, the more is photography benefited, and the more popular will it become. We shall have four classes, give four prizes in each class (gold, silver, and bronze medal, and certificate), each competitor will have to contribute ten slides, and will be at liberty to enter only *one class*. It is in fixing the subjects of the four classes that we want suggestions, and trust that many will have something to say on the matter.

In connection with the Seventh International Congress of Hygiene and Demography, to be held in August, Mr. Andrew Pringle calls our attention to Section II., Bacteriology. It is proposed to make a special feature of photography as applied to bacteriological research. The following exhibits are suggested:—

- "Photo-micrographs, preferably unframed.
- "Lantern slides or transparencies.
- "Photographs of patients or parts affected with diseases known or supposed to be due to micro-organisms.
- "Photo-micrographic apparatus complete; or parts of the same intended for illumination, as lamps, heliostats, condensers, liquid-cells; also objectives, etc., etc."

Lantern slides will be projected on the screen at intervals by means of the optical lantern.

Communications respecting the photographic department are to be made to Mr. Andrew Pringle, Cromwell House, Bexley Heath, Kent.

Intending exhibitors are requested to give notice to Mr. Pringle not later than July 15th. All exhibits will have to be delivered at the University of London, Burlington House, not later than August 1st.

Many of our readers are doubtless interested in bacteriology, and may be glad of the foregoing information.

The London *Figaro* is responsible for the following:—  
“The Grand Duke Michael, disdaining, it is said, to live upon his wife's relatives, has resolved to turn to the camera as a means of gaining his livelihood. Here is a chance then for rich snobs. To be photographed by a Royal Archduke will be well-nigh as pleasant an experience, and a much cheaper one, as being painted by an R.A.”

MR. NELSON K. CHERRILL, well known in photographic circles as an authority upon enamels, has written a long letter to a recent number of the *English Mechanic* on “Some Proposed Improvements in Cameras of the ‘Tourist’ Type,” in which he hits out rather strongly at the “average camera maker” and his camera, and proposes a substitute for the wood and brass arrangement, which is certainly novel. Mr. Cherrill says:

“It would be out of place to stop here to write a treatise on ‘What to photograph, and how to select it;’ but I think all the best masters of the art will bear me out in this, that the selection *must* be made quietly and deliberately on the lines of definite rules of art, and from Nature itself, and not from an inverted image seen with a blanket tied round one's head.”

The writer goes on to bring forward some arguments in favour of the abolition of the focussing screen, and says:

“The determination of the exact point at which a landscape should be in focus is not so difficult or delicate a matter as the like determination with a portrait, chiefly because of the vastly superior depth of focus of landscape lenses.”

The italics are ours, as we were under the impression that depth of focus was dependent on ratio aperture, and not the style of lens. However, Mr. Cherrill gives us his ideas of a camera in the following words:—

“Would not half a dozen or so of fine steel knitting needles, suitably fixed, form an ample support, and as rigid as need be to connect these two (the plate and lens) together?—and, I think, if you consider that the lens only weighs a few ounces, and that the breaking strain of the needles would be some tons, it can only be a question of a little comparatively simple engineering to secure a rigid support from such slight means.”

Mr. Cherrill gives working drawings of his proposed camera, and possibly such a camera might find favour in the eyes of some, but when we consider that the larger size lenses—for instance, a whole-plate or 10 by 8, will weigh from 20 to 30 ounces, one necessarily begins to question whether the knitting-needle camera will not bend and quiver very much with such a weight attached. Those of our readers, however, who are desirous of making a small light camera should refer to the original letter, which will be found on pp. 316-318 of the *English Mechanic* for June 5th.

A writer in the *Birmingham Daily Gazette* deals with the forthcoming Photographic Convention at Bath, which, by the bye, there is every reason to believe will be a great success; he is also kind enough to say:—“They have magazines of their own in which their excellent work is described or reproduced, and we observe in the current number of the *Photographic Reporter* that a local amateur, Mr. W. G. Perry, has achieved some distinction in obtaining a charming picture of the “River Ouvry, Shropshire.”

Then follow a few remarks upon the vexed question of amateur and professional which are sufficiently interesting to reproduce here:—

“The question arises—What will the professional photographer do as the amateur advances in his art? That question need not cause any great alarm. To begin with, the amateur who makes photography his amusement will never degrade himself by competing with the man who makes photography his trade. It seldom happens that the amateur's pictures are worth purchasing by the public, and even if they were that public would necessarily

be limited to his circle of friends. But there is really a very effectual safeguard against an incursion upon the professional's domains. Up to a certain point photography is simple and cheap. Beyond that point it becomes complicated and expensive. The professional, sure of his results and certain of compensation, can devote time and money to perfection. Only a comparatively small number of the immense tribe of amateurs will give themselves the extra trouble to master the business, and only a still smaller number will venture on the increased expense. Those who can afford the money to expend upon a pastime are not likely to compete with the professional for money; and the few who may do so, after all, will only form that addition to the professional ranks which must be expected. On the other hand, the efforts of the amateurs indubitably have the effect of stimulating the professionals to produce their best work. The latter cannot afford to be equalled, and they will labour to excel. Day by day better methods are contrived and superior results are attained, and we must regard the immense advance in higher-class photography as due in no small measure to the impetus which comes from those in the lower ranks.”

WE are told there is an opening for a limited number of members to start a new postal club titled the Scottish Postal Photographic Club. There are many similar clubs flourishing in England, doing useful work, but this is the first attempt across the border, and will be run on entirely new lines. In addition to the usual discussion, criticisms, etc., by the members, arrangements have been made with a professional of high standing to criticise the prints every month, and a selection of the most suitable prints will be mounted in albums and presented to the various hospitals in Scotland, as decided upon by the members. The Hon Secretary, Mr. John Milne, 4, Devanha Terrace, Aberdeen, will be glad to hear from intending members. Specimen prints must be sent.

#### COPYING—BLACK AND WHITE.

THE reproduction of black and white designs, diagrams, or chalk drawings is a work often required to be done by amateurs, and very frequently the results they obtain are far from satisfactory. In the following notes we do not intend to give precise definite instructions for exposure, because that is almost an impossibility, and one or two trials will immediately give more information than a page of our notes.

The subject to be copied should be pinned or otherwise fastened as flat as possible. If a diagram from a book is required, the leaf bearing the figure should be placed behind an old negative glass and clipped to it by two or more broad indiarubber bands so as to keep it as flat as possible. If a loose drawing or sheet, then it can easily be kept flat by being placed behind an old negative glass or sheet of plate in a printing frame. The diagram or sketch thus mounted should be hung squarely in front of a window, and the camera placed opposite to it. Side lighting should be avoided, or any grain in the paper may show; in fact, if full front lighting cannot be obtained, it is preferable to work by artificial light, using a lamp at equal distances on each side.

The distance from the subject to lens and from lens to focussing screen is determined by the amount of reduction, or, in other words, the size of the copy as compared to the original. The necessary distance can be found in most handbooks and annuals, in the table of enlargements and reductions, or they may be easily calculated from the following simple rules:—To find the distance from lens to focussing screen: Divide the number of times of reduction plus 1 by the number of times of reduction, and multiply by the focus of the lens. To find the distance from lens to subject: Add 1 to the number of times of reduction, and multiply by the focal length of lens. Examples: A subject 12 in. long is to be copied, the reproduction is to be 3 in. long, the lens we are using is of 8 in. equivalent focus;

then the amount of reduction is obviously from 12 to 3, or the subject is to be reduced four times,—

$$[4 + 1] \div 4 \times 8 = 5 \div 4 \times 8 = \frac{5}{4} \times 8 = 10,$$

and  $4 + 1 \times 8 = 40$ .

The distance from lens to subject is 40 in., and the distance from lens to screen 10 in.

Having sharply focussed, the next important point is what diaphragm to use. This can only be determined by examination of the focussing screen. And it is advisable to examine the marginal definition with a compound focuser, inserting smaller diaphragms if this is defective; but as large an aperture as possible should be used.

The next important question to decide is the dry plate to be used. That is a point on which a good deal depends; in fact, with anything but the right brand success is all but impossible. There are one or two plates in the market which have been introduced under the name of "photo-mechanical plates," specially for such work, but we have used with perfect results a plate which most amateurs have by them, or can, at least, obtain without any difficulty, and that is the ordinary bromide lantern plate. The chloride plate is useless for this work, and the chloro-bromide plate does not give such good results as the ordinary lantern plate.  $3\frac{1}{2} \times 3\frac{1}{2}$  is, for book work, a convenient size too, as the resulting negatives give a decent sized diagram. Where, of course, the reproduction is required larger than this, a larger plate can be easily obtained from the manufacturer or dealer.

We have already stated at the commencement of this article that it was not our intention to give definite instructions as to exposure, but, as a guide, we may state that, desiring to have a faithful copy of an intricate diagram, we have this week exposed a lantern plate on a black and white subject, reducing it to one-third the size with a 9 in. focus lens, and, working under the conditions above-named, with  $f/18$  aperture, we found 75 secs. ample exposure.

Development may be effected with pyro or hydroquinone. Ferrous oxalate is utterly useless, and so far we have been unable to obtain such fine results with eikonogen as with the two first-named agents. Before giving the formulæ for these developers, we must clearly define what we want. The main point is, absolute clear glass in the lines of the diagram, and if we can obtain it absolute, opacity in the ground, or in other words, the whites of the paper, must be represented by as dense a deposit as possible; still, the main point, and the one we must never lose sight of, is absolute clear glass in the lines representing the lines of the diagram.

The number of formulæ for the pyro developers for this work are, like that of all other formulæ, almost illimitable. We shall content ourselves with two only, that we can recommend from actual experience:—

#### MAWSON AND SWAN'S DEVELOPER.

(A)

Pyrogallol .. ..	60 grains.
Potash metabisulphite .. ..	60 "
Ammonium bromide .. ..	60 "
Distilled water .. ..	20 oz.

(B)

Liq. ammon. '880 .. ..	2½ drachms.
Distilled water .. ..	20 oz.

For use, mix in equal parts.

#### EDWARDS' REDEVELOPER.

(A)

Pyrogallol .. ..	64 grains.
Citrate of ammonia .. ..	20 "
Or Citric acid .. ..	15 "
Distilled water .. ..	4 oz.

(B)

Liq. ammon. '880 .. ..	2 drachms.
Ammonium bromide .. ..	180 grains.
Distilled water .. ..	4 oz.

For use, mix in equal parts.

It will be seen that the two formulæ differ widely in strength, yet both give fine results. Of the two, we have a leaning to the latter, though slightly more wasteful than the former.

For hydroquinone we also give two tried friends:—

#### ENGLAND'S DEVELOPER.

(A)

Hydroquinone .. ..	150 grains.
Sodium sulphite .. ..	480 "
Potassium bromide .. ..	20 "
Distilled water .. ..	to 20 oz.

(B)

Carbonate of soda .. ..	2 oz.
Carbonate of potash .. ..	2 "
Distilled water .. ..	to 20 "

For use, mix in equal parts.

#### WILKINSON'S FORMULA.

(A)

Hydroquinone .. ..	80 grains.
Meta-bisulphite of potash .. ..	120 "
Bromide of potash .. ..	5 "
Distilled water .. ..	20 oz.

(B)

Caustic potash .. ..	200 grains.
Distilled water .. ..	20 oz.

For use, mix in equal parts.

The latter of these two formulæ is the quicker in action.

The actual details of development are practically the same as usual. The plate should be dusted, placed in the dish, and flooded with the developer, the finger passed over it to remove air bells, and development allowed to proceed, bearing in mind that clear glass lines are required; if there is the slightest sign of any line clogging up or fogging, instantly wash off the developer and fix. When the plate is thoroughly fixed, and not before, take it out into daylight and examine. If the lines show perfectly clear, but density in the ground is wanting, intensification will soon set this right, but if the lines show any sign of deposit, we may either resort to reduction or expose a fresh plate.

After having well washed the negative, it should be cleared with the ordinary acid alum bath, or with Edwards' iron and alum clearing bath, and we can now decide to intensify or reduce as we think necessary. If the former is considered necessary, Monckhoven's silver cyanide intensifier will give good results, provided the negative is absolutely free from hypo, and to ensure this it is advisable to use a simple eliminator like hydrogen peroxide or a few drops of tincture of iodine, then after well washing the negative it may be bleached in the mercuric chloride solution, well washed for at least half an hour, and blackened in the cyanide solution, and again well washed. If any lines show a deposit, it is advisable to resort to the process of reduction, and Belitzki's reducer first applied and the negative well washed, and then intensification proceeded with.

A negative thus prepared should give prints on bromide paper quite equal in sharpness of drawing and whiteness of ground to the original, and such a negative may be used for photo-mechanical work, or for the reproduction of the diagram by any of the iron printing processes with excellent results. The question of stripping and reversing the film, we shall treat of in a future article, and we must also defer our notes on the iron or other printing processes used for reproducing plans, diagrams, etc.

## Letters to the Editor.

### IS PHOTOGRAPHY A FINE ART?

SIR,—Mr. Pennell's paper, recently read at the Conference, and the various observations since made upon it, draw attention to the most interesting characteristic of photography. There is no doubt that "light draughtsmen" do not pay sufficient attention to the artistic character of their works. When the art was in its infancy—when the scope and limitations of lenses, developers, and illuminating media were scarce understood—the operator who could turn out a series of clear negatives was looked upon as little less than a genius. But now, when all this is changed for the better, we begin to expect to find in our photographs some of the grace and charm which other artistic processes have accustomed us to. The fatal mistake of Mr. Pennell's contention is that neither he nor any one else can define with any exactness what is and what is not fine art, for the very simple reason that fine art depends entirely for its acceptance upon the sensorial capacity of its beholders, and whilst one person can differentiate two delicate tints of colour, another is colour-blind, thus proving that no two people see alike, and that what is beautiful to one is gross ugliness to another, a truth which everyone can see demonstrated in the so-called "types of English beauty" now exhibiting in the shop windows. Perhaps, as an approximation to an art definition, one might say that it is a *beautiful portrayal of a noble sentiment*. Photographers have advanced as far as the beautiful portrayal, and it now remains for them to pervade their works with idyllic grace, and instead of being content with clean and vigorous rescripts of natural scenery, so to compose its beautiful elements as to make them express the pathos of a tender sentiment. Unfortunately, the term composition suggests to the ordinary mind an elaborate piece of arrangement such as Wilkie's "Blind Fiddler" or Maclise's Play Scene from "Hamlet," but an ideal picture may be composed of much simpler elements than these. A little weeping child holding a dead pet bird, and entitled "Infant Sorrows," a poor ill-clad man, turning out his pockets, and entitled "No Effects"—both of them, with a suitable landscape background, give an idea of the sort of materials which form the staple of pictures exhibited at the Royal Academy and elsewhere. "Love at First Sight," by Marcus Stone, in this year's show, consists simply of a girl in a garden seated in the foreground, with two figures in the distance, one a young man looking back. "A Passing Cloud," the same two figures, the girl standing leaning upon a gate pier in the foreground whilst the young lover is seated moodily in the distance of the garden; or "An Enigma," two figures seated on a sofa in a drawing room, the young man looking sideways at the young lady, whose head is turned slightly away—what could be simpler? Materials such as these are to be found in every household. And yet with such simple examples before them photographers go on producing works which exhibit no sentiment nor the slightest amount of pathetic interest whatever. Can we wonder then at Mr. Pennell's saying "Photography is not fine art, nor ever can be"?—Yours, etc.,

FRED. DAVIS.

### PERSPECTIVE DRAWING AND VISION.

SIR,—Messrs. Emerson and Goodall, in drawing attention to and in emphasising certain hypothetical differences between the image transmitted by the crystalline lens of the eye, and that which is formed by a glass lens, have brought forward several points which no doubt seem to explain why some scenes which appeal to the eye are apt to develop deficiencies when turned into prints.

My object in writing is neither to combat nor corroborate the "propositions, proofs, or deductions" included in "Notes on Perspective Drawing and Vision," although as regards proposition A, at all events, my own personal observation makes me inclined to agree with the authors; but what I desire to do is to admonish the ordinary rank and file not to be discouraged by the prominence given to the more or less problematical defects which are moreover dwelt upon.

Let me remind all and sundry that the faults, such as they are, have existed from the beginning, and all that is now being done is to theorise upon their cause, which may eventuate in the removal of this microscopic mote from the eye of our camera. Not so long ago we heard a good deal about false tones in landscape studies, with the result that, so far from this being found

to be an inherent and incurable blemish, by the judicious employment of photographic chemistry and of optics, the fault was all but completely remedied. That prints are still seen with a grossly false relationship of tone is mainly due to ignorance and want of appreciation on the part of the worker, rather than to any great lack of perfection in the apparatus or processes. And so with this latest of incurable diseases which photography has from time to time been found to suffer from. Depend upon it that if there be any demand for the magnification of our distances, or for turning parallel sided towers into inverted truncated pyramids, means will be found for doing so. Perhaps the resulting views will look all wrong, but what of that if we know them to be all right?—Yours, etc.,

H. MACLEAN.

\*\*\*

### AN EXPLANATION.

SIR,—I note your observations anent my concluding article entitled "Photography as a Recreation for Ladies" in this journal, and in fairness to myself crave a little space for an explanation.

I was out of town when the article in question was set up, and, therefore, had no opportunities of revising the proof; hence the mistakes that you so generously point out.

The fixing bath should have read:—

Hyposulphite of soda	..	..	..	5 ozs.
Liq. am.	..	..	..	2 drms.
Water	..	..	..	30 oz.

Unfortunately, my wretched caligraphy led the ingenious compositor to transpose the cypher, with the result quoted. The other errors would not have crept in had I seen the proof. No one regrets the occurrence more than myself, but even you, Mr. Editor, cannot be entirely unacquainted with the eccentricities of printers and their subtle humour.—Yours truly,

SOL.

Lady Office, Bedford Street, W.C.

\*\*\*

### GLASGOW INTERNATIONAL EXHIBITION.

SIR,—I have pleasure in announcing that the following gentlemen have kindly consented to act as Judges at this Exhibition. There are three photographers and two painters, namely, Messrs. Valentine Blanchard, Adam Diston, Richard Keene, Francis Powell, Pres. R.S.W., and William Young, R.S.W.

I hope shortly to name two gentlemen with a special knowledge of photo-mechanical work, who will assist the others in that section.

There is a slight error in our prospectus which may lead to some misunderstanding. In the clauses at the head of the list of classes, "Class 24 (Scientific) may be, etc.," should read, "Class 25 (Scientific) may be, etc."

I beg to confirm the arrangement already announced by the Cardiff Executive, whereby pictures entered for both exhibitions can be sent on here, carriage paid.—I am, etc.,

WM. GOODWIN (Hon. Sec.)

\*\*\*

### EXHIBITION AT THE CAMERA CLUB.

SIR,—Will you kindly allow me to state that the Exhibition of photographs by the Marquis D. Vianna de Luna, and the Countess Loredana da Porto Bonin, which was announced to be opened at the Camera Club on Tuesday, June 25th, is unavoidably postponed.

The Exhibition will commence on Thursday, July 16th, after which date the pictures will be open to inspection by visitors under the usual conditions, namely, from 10 a.m. to 4 p.m. on production of tickets, which may be obtained from the Hon. Sec. and from members generally.—I am, etc.,

G. DAVISON (Hon. Sec.)

Camera Club, Charing Cross Road, W.C.,  
June 20, 1890.

**Pyrogallic Acid.**—The *Glasgow Evening News* says: "Seeing how fashionable photography still is, it may be well to publish the details of a sad accident which tends to show the danger that lurks in the developing cup. A well-known photographer of Baltimore has lately met his death by mistaking, in the dim light of his dark-room, a solution of pyrogallic acid for a glass of whisky and water. He knew too well the danger he was in, and he took a powerful emetic without delay, but the virulent poison had entered too far into his system, and in three days he was a corpse."

## Composition, and Light and Shade.

*Selected and arranged for the use of Photographers, from "Burnet's Essays," with Introduction and Notes.*

By H. P. ROBINSON.

### CHAPTER XII.

FIG. 27 is a sketch of Wilkie's admirable composition of the Blind Fiddler. I shall leave it to the student's own judgment to investigate the various forms on which this composition depends.

By making the principal heads depend upon one mode of arrangement, the general appearance of the group on a different mode, the background on a third, and so on with the minor points (provided they all tend to the assistance of

which to a cultivated mind increases (not diminishes) by the investigation of the cause which produces it. For example, a beautiful appearance in nature affects the savage and the philosopher from their sensations merely as men; but a painter, whose life is spent in a constant competition with nature in producing the same effects, receives a tenfold gratification in following her through those assemblages which to the world beside are, as it were, "a fountain sealed and a book shut up." Hence, in art, a beautiful arrangement must be a selection of those forms, lights, and colours that produce a similar result; and the taste of an artist is shown in heightening their effect by the absence of those circumstances which are found by experience to produce the contrary. Did an investigation of the means pursued by the great masters tend to abridge an artist's pleasurable sensations, instead of being the most favoured, he would be rendered

the most miserable of beings: but the opposite is the case, as by such means he is taught an alphabet that enables him to understand the language of nature. It may be supposed that, in my search after so desirable an object, I have perused all the works written to define Beauty and Taste, and which endeavour to circumscribe with a line that endless variety and omnipresence which make nature a source of gratification to all nations under every alteration of the mind; but as I wish to avoid all controversy on the subject, which we often find merely renders the most sublime truths more obscure, I shall only remark that, as far

FIG. 27.—WILKIE.

one another), his composition will not only have intricacy without confusion, but that variety which is so characteristic in nature. A beautiful combination in nature will often appear to evade every rule, by her being perfect in every mode of examination. All her varieties emanate from a straight line and a curve. A judicious arrangement of objects possessing these various forms gives the strongest natural appearance to a picture; nor ought the artist to leave out rashly what he may conceive to be void of beauty. In colouring, harsh tints are admitted to produce harmony in the other colours; and the most picturesque arrangements often depend on the presence of what might be otherwise considered ugly forms.

As I have made use of the terms "beautiful and agreeable arrangements," it is proper to give an explanation of the sense in which they are applied. By a beautiful arrangement, I mean a proper adaptation of those principles that arrest a common observer, and give a pleasurable sensation,

as painting is concerned, the authors of many of these works have done an irreparable injury. Artists generally prefer the opinions of untutored children to the remarks of the most learned philosophers, whose advancement in other sciences really seems to increase their ignorance of this. If I have explained my definition of the terms sufficiently for the artist's comprehension, I am satisfied. To explain them to others would be equally impossible as that those others should be able to define them to us. The mind must have received its education through the medium of the eye, not of the ear, to enjoy the faculty of conceiving such ideas, or the power of tracing them to their original source in nature, or in art, as a test of their truth.

Before I conclude, I have to apologise for the paucity and brevity of these observations, and beg the reader's constant reference to the plates, as the only method of making myself correctly understood. Painting is a practical branch of philosophy, and can only be rendered clear by

satisfying the observations of the eye, as well as the reflections of the mind; this, perhaps, is one reason why so much has been written on the subject without those truths being made sufficiently obvious which the writers wished to demonstrate.

I have also been anxious to avoid tautology, as it will be necessary to go over, in a great measure, the same ground, when I come to treat of light and shade; when many observations which appear to be omitted here will present themselves, from belonging more properly to that division of the work.

I must also caution the young artist against supposing that these modes of arrangement are given for his imitation; I merely wish him to be acquainted with the advantages any particular composition possesses, that in adopting any invention of his own, he may engraft upon it those or similar advantages. A design that has nothing but novelty to recommend it is a conceit, not a composition. The student in painting can hope to derive advantage from theory only, when rendered obvious by ocular demonstration. One great cause of the obscurity which envelops the art is the criticism of those whose ideas on the subject are obscure;—to free the world from their influence is perhaps impossible; but the artist must free himself.

## Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(Continued from page 372.)

BROMINE is obtained in the free state in the same way as chlorine, namely, by heating a bromide with manganese dioxide and sulphuric acid.

EXPERIMENT 142.—Grind together carefully 5 grammes of potassium bromide and 10 grammes of manganese dioxide; put the mixture in a small retort connected with a receiver, as in fig. 23; add 10 c.c. of sulphuric acid previously diluted with half its volume of water, and allowed to cool, and shake until the contents of the retort are thoroughly mixed. Now heat gently, keeping the receiver carefully cooled, and the bromine will distil over as a dark red oily liquid,  $2\text{KBr} + \text{MnO}_2 + 2\text{H}_2\text{SO}_4 = \text{Br}_2 + 2\text{H}_2\text{O} + \text{K}_2\text{SO}_4 + \text{MnSO}_4$ .

N.B. If you are not able to perform this experiment in a proper draught-chamber or out of doors, use a test tube and very small quantities of the substances. In this case you cannot condense the liquid in another vessel, but observe the colour of the vapour and the oily drops that form on the cold upper portion of the tube.

Bromine is a heavy dark red liquid, intensely corrosive and with great chemical activity. It is very volatile, giving off large quantities of vapour at the ordinary temperature, and it boils at  $63^\circ\text{C}$ . The vapour is most irritating, even when mixed with large quantities of air; it combines directly, like chlorine, with phosphorus, and with many metals. Bromine is somewhat soluble in water, and the solution, which is known as *bromine water*, has the colour, smell, and many of the properties of the liquid. When exposed to light, it alters much more slowly than chlorine water under the same conditions. Bromine is much more soluble in ether, carbon bisulphide, or a solution of potassium bromide than in pure water.

Hydrogen bromide is liberated by the action of strong sulphuric acid on bromides, but is always mixed with some free bromine.

EXPERIMENT 143.—Put a small quantity of solid ammonium or potassium bromide in a test tube, and add to it some strong sulphuric acid; dense white acid fumes of

hydrogen bromide are given, accompanied after a very short time by orange-red fumes of free bromine. The liberation of the hydrogen bromide takes place in the same way as the liberation of hydrogen chloride (Expt. 126),  $\text{KBr} + \text{H}_2\text{SO}_4 = \text{HBr} + \text{KHSO}_4$ , and the liberation of bromine is due to a secondary reaction between the hydrogen bromide and the excess of sulphuric acid, thus,  $2\text{HBr} + \text{H}_2\text{SO}_4 = \text{Br}_2 + 2\text{H}_2\text{O} + \text{SO}_2$ .

Pure hydrogen bromide is obtained by the action of bromine on phosphorus and water, thus  $\text{Br}_2 + \text{P} + 4\text{H}_2\text{O} = 5\text{HBr} + \text{H}_3\text{PO}_4$ . The gas is very similar to hydrogen chloride, but is more readily decomposed by heat and by the action of any substance that will combine with either the hydrogen or the bromine, because the attraction of the bromine and hydrogen for one another is weaker than the attraction between chlorine and hydrogen. The gas dissolves readily in water, forming hydrobromic acid, which is very similar to hydrochloric acid in all its properties. If a strong solution of the acid is exposed to light in presence of air, a small quantity of free bromine is liberated, and it acquires a slight orange colour. Hydrobromic acid attacks many metals, and with them, or with metallic oxides and hydroxides it yields the salts termed bromides, identical with those obtained by the direct combination of bromine with the metals.

The attraction of bromine for hydrogen makes it a useful oxidising agent. It will also bleach, but in both cases is less energetic than chlorine.

EXPERIMENT 144.—Repeat Expts. 138 and 139, using bromine water in place of chlorine; similar products will be obtained.

Iodine is obtained from iodides in the same way as chlorine or bromine from chlorides or bromides.

EXPERIMENT 145.—Grind 5 grammes of potassium iodide with 10 grammes of manganese dioxide, put the mixture in a porcelain dish, and add 10 c.c. of strong sulphuric acid. Cover the mixture with an inverted glass funnel, and heat with a small flame placed just under the middle of the dish, so that the funnel remains cool (fig. 27). Iodine is liberated, and forms a deep violet vapour which condenses on the sides of the funnel in dark grey metallic-looking hexagonal plates.  $2\text{KI} + \text{MnO}_2 + 2\text{H}_2\text{SO}_4 = \text{I}_2 + 2\text{H}_2\text{O} + \text{K}_2\text{SO}_4 + \text{MnSO}_4$ .

Iodine is only very slightly soluble in water, but it dissolves more readily in alcohol, ether, carbon bisulphide, or an aqueous solution of potassium iodide. Confirm these statements by shaking crystals of iodine in small test-tubes with small quantities of each of these liquids. Iodine melts at  $115^\circ\text{C}$ , and boils at above  $200^\circ$ , giving a deep violet vapour, which is 127 times heavier than an equal volume of hydrogen, and nearly 8.8 times heavier than air. The solid and its solutions stain the skin yellow, and also act rapidly on other forms of organic matter. Iodine combines directly with phosphorus and with a certain number of metals, but its chemical activity is considerably less than that of bromine. Its characteristic property is its power of forming with starch a compound which has a very intense blue colour.

EXPERIMENT 146.—To some fresh starch paste add a very small quantity of a solution of iodine in alcohol or in potassium iodide solution; a deep blue, almost black colouration will be produced. Heat the liquid nearly to boiling, and the colour disappears, but returns as the liquid cools.

This property belongs only to free iodine, and not to iodine in combination.

EXPERIMENT 147.—To some starch paste add some solution of potassium iodide; no colour appears, because the

FIG. 27.

iodine is combined with potassium. Now add a small quantity of chlorine water or bromine water, and the colour instantly appears, because the chlorine or bromine combines with the potassium and sets free the iodine, which at once combines with the starch.

Iodine, like fluorine, chlorine, and bromine, forms only one compound with hydrogen; the attraction between the two elements is feeble, and they will only combine directly under special conditions.

*Hydrogen Iodide*, HI, cannot be obtained by the action of sulphuric acid on iodides.

EXPERIMENT 148.—To a small quantity of solid potassium iodide in a test tube add some strong sulphuric acid; iodine will at once separate, an odour of sulphur dioxide or sulphuretted hydrogen will be perceived, and only a very small quantity of fumes of hydrogen iodide will be given off. The primary reaction, as with chlorides and bromides, is  $2KI + H_2SO_4 = 2HI + K_2SO_4$ , and the secondary reactions, which take place to a much greater extent than with bromides, are  $2HI + H_2SO_4 = 2H_2O + I_2 + SO_2$ , and  $3HI + H_2SO_4 = 4H_2O + 4I_2 + SH_2$ , according to the relative proportions of the reacting bodies.

Hydrogen iodide is obtained by heating together iodine, water, and red phosphorus:  $I_2 + P + 3H_2O = 5HI + H_3PO_4$ .

It is a heavy colourless acid gas, which fumes strongly in the air and dissolves very readily in water, forming *hydriodic acid*. Both in the gaseous state and in solution, it closely resembles hydrogen chloride and hydrogen bromide, but is much less stable, and when heated or exposed to light it splits up into hydrogen and iodine  $2HI = H_2 + I_2$ . This change takes place still more readily in presence of anything that can combine with hydrogen, and its great tendency to part with hydrogen makes hydrogen iodide (both gaseous and in solution) a very powerful reducing agent. Hydriodic acid attacks many metals, and dissolves carbonates and oxides, forming salts (iodides) that are identical with those obtained by the direct union of iodine with metals.

The chemical energy of the four elements fluorine (at. wt. = 19), chlorine (at. wt. = 35.5), bromine (at. wt. = 80), and iodine (at. wt. = 127), their tendency to combine with hydrogen and with metals, and the stability of the hydrogen iodides and other iodides, diminish as the atomic weight of the halogen increases. Fluorine is the most active, and, in fact, is the most energetic of all the elements; iodine is the least active of the four. Fluorine will displace chlorine, bromine, and iodine from their compounds; chlorine will displace bromine and iodine; bromine will displace iodine. This last sentence is true only when the displacing elements are in the free state; interaction between fluorides, chlorides, bromides, and iodides is governed partly by the nature of the metals with which the halogens are combined in the different cases.

EXPERIMENT 149.—To a solution of potassium or ammonium bromide add a small quantity of bromine water, then some carbon bisulphide, or ether, and shake; the chlorine expels the bromine, and the latter dissolves in the ether or carbon bisulphide, giving it an orange-red colour.  $KBr + Cl = KCl + Br$ .

EXPERIMENT 150.—Perform a similar experiment with potassium iodide solution, chlorine water, and carbon bisulphide; the chlorine displaces the iodine, and the latter dissolves in the carbon bisulphide, forming a violet solution:  $KI + Cl = KCl + I$ .

EXPERIMENT 151.—Perform a similar experiment with potassium iodide, bromine water and carbon bisulphide; the bromine displaces the iodine.  $KI + Br = KBr + I$ .

—◆◆◆◆◆—  
**Ourselves.**—An American lecturer writes: "The AMATEUR PHOTOGRAPHER always remains my most interesting reading."

## With a Camera in Austro-Hungary.

By THE YANKEE SUNFLOWER.

THE Editor of the AMATEUR PHOTOGRAPHER asks for notes on photographic tours. During the past twelve months my hand-camera has accompanied me among the fiords and glaciers of British Columbia—

By the tall minarets of pine,  
 And awful Shasta's icy shrine—

and all the way down the Pacific coast of Washington, Oregon, and California to the Mexican frontier, and then by the City of the Saints and the Garden of the Gods to Nova Scotia; and in this hemisphere as far east as the Carpathians and the Danube.

Which part shall I first describe? The American scenes are too far away for a summer holiday, and those of Western Europe are overdone, but within forty hours by rail from London are two cities on the Danube—Vienna and Budapesth—which, if my recent experience be any guide, offer to the amateur who has a fortnight to spare, more attractions than any other district that I have visited within an equally short distance from London.

For less than eight pounds a return second-class ticket may be purchased, giving the choice of several routes, each of which is so full of delightful scenery that I would advise the tourist so to arrange his journey that he sleeps in the hotels, and has the advantage of daylight for the whole journey. Having on previous visits to Europe tried every other route, I this time purchased a ticket *via* Harwich, Antwerp, Cologne, Frankfurt, Nuremberg, to Vienna, going by steamer down the Danube to Budapesth, thence northwards to Berlin and back *via* Rotterdam. Starting from Leeds, I found along the railway many tempting subjects for the hand-camera, especially about Ely. At Antwerp, where I found good entertainment and an English-speaking host in the Hotel d'Hollande, and every possible photographic facility in a neighbouring store, I had but little time to linger, while Mechlin and Brussels beckoned me onwards. From Cologne to Frankfurt the traveller has the choice of routes on either bank of the Rhine. In the early morning he will find the eastern bank, and from 11 a.m. till dusk the western bank most favourable for photographic shots, but if he is not in a hurry it is best to take the steamboat in preference to railroad all the way from Cologne to Mayence, and go thence per rail to Frankfurt on the Maine. Here the Electrical Exhibition was my chief inducement to linger. It was, however, but a beggarly array of empty boxes when I saw it, not half the exhibitors being ready. The captive balloon offered a splendid opportunity for bird's eye views. Thence by Offenbach, Hanau, Aschaffenburg to Nuremberg, till at Ratisbon we came within sight of the Danube, and at Passau we entered Austria. Here, as also on the Dutch and German frontiers, my stock of sensitive plates purchased in England was allowed to enter without question and without duty, and from this point to Vienna, all day long so many characteristic scenes offered themselves, that the great difficulty was to resist the temptation to expose too many plates. Of Vienna I had pleasant memories of bygone days, when in 1873 I spent five months at the international exhibition there, and though many a friendship then commenced had been interrupted by death, there were nevertheless enough old friends remaining to so monopolise my time that I had not a chance of *making* a single photograph, though I *took* several. While I could buy very few satisfactory views in the shops, I was fortunate enough to be able to exchange the lantern slides that I had made on

the Pacific Coast for admirable amateur work in the Alpine districts of Austria and Hungary.

Of course, I left my card with Mr. Srna (you pronounce the queerly-spelt name Sairnah), the Secretary of the very aristocratic Amateur Photographers' Club of Vienna, and within an hour my visit was returned by the President of this club, Mr. Ulrich himself, who not only conducted me through the interesting exhibit of artistic photographs, but also introduced me to several amateurs. I found the fact that I am a member of an American camera club a sufficient introduction everywhere, but nowhere did I meet with such extraordinary politeness and attention as in Vienna, both from the members of the photographic societies and from professors who use the camera principally as an aid to the study or the teaching of natural science.

The exhibition itself I have heard very sharply criticised, especially in Berlin; but having due regard to its object, I think it was very satisfactory. There was no question of processes or the use of the camera to correct the deficiencies of human vision. There was only one professional photographer on the jury; all his colleagues were artists, and the measure which they applied to their selection was that the photographer should represent nature (so far as the limitations of his instruments permit) just as the artist sees it. I am no artist, and therefore cannot presume to criticise their choice. Some of the very best productions of the recognised masters of landscape photography in England were there, but I cannot say that the Germans suffered by comparison with them. In one style, indeed (the genre pictures), the Vienna exhibits seemed decidedly superior to any that I have ever seen before, perhaps because they had such admirable models. The painters can in some measure correct the defects of his models. The photographer must take them with all faults, and I have hardly seen a single set picture in which the model, whether she be Mrs. James Brown Potter or the beefy females who are represented in a recent New York photographic annual—satisfied one's idea of artistic fitness. Here at least I found not a single instance of obtrusive bad taste. What I missed most of all was a description in the catalogue of the instruments and processes employed, which would have added much to the interest of the exhibition, and would have prevented some curious misunderstandings on the part of some professional photographers who judged the exhibits by the processes which they usually employ in the atelier. So, before two landscapes by Lyonel Clark, I heard a professional say that they were excessively retouched, yet the supposition that Mr. Clark had either put his lens out of the focus or used an uncorrected lens, or finally made the negatives without using a lens at all, seemed to be a sufficient reason for their appearance.

As on the Rhine, so on the Danube, I advise every photographer who has leisure, to use the steamboat in preference to the train. He will find on both rivers most beautiful views without the ugly foregrounds which are inseparable from the railroad. Pressure of business forced me on this occasion to use the night and the train. But while in Budapest, engaging one of those commissioners who are to be found at the corner of every street as guide and porter, I spent a few hours very profitably in photographing interesting street scenes in the sister cities of Pesth and Ofen. From Budapest to Berlin I had the choice of three routes, all very picturesque, and having in earlier days travelled by Prague and Dresden, and through the valley of the Waag, I took this time the less interesting route by Ruttek and Hatvan. In Berlin I was fortunate enough to meet both Dr. Vogel and Dr. Stolze. The latter, who is equally distinguished as photographer and

phonographer, induced me to stay a night longer than I had intended, to attend a meeting of the photographic society over which he presides, and here I heard a German variation of the arguments so often heard in England for photographic sharpness as against impressionist fuzziness, and met Dr. Bruno Meyer, the most successful maker of lantern slides in all Germany.

While travelling, I was induced, by the ingenuity of its construction and its extraordinarily low price, to purchase a stereoscopic hand-camera which could also be adapted to making lantern slides and to pictures 9 by 12 c.m. (say  $3\frac{1}{2}$  by 5 inches). I pulled it to pieces, and found that the two doublets were simply formed of two uncorrected or non-achromatic lenses, and there being no focusing glass the difference between the visual and optical focus of the lens is, of course, non-apparent to the purchaser. Nevertheless, the results which I obtained with this cheap little instrument, even when magnified by the Sciopicon, are quite equal to the best I have seen obtained by cameras costing three times the money.

On the whole, I had every reason to congratulate myself on having taken from England a stock of celluloid films, which, though more expensive than glass, were cheaper to me in actual use, because I could cut them with a knife to suit any size of dark slide, and I saved much in carriage and breakage, and could, whenever I chose, make a few test developments much more readily than with the continuous film used in the Kodak.

From Oderberg, *via* Berlin and Rotterdam, the journey is so uninteresting that it may well be made in the dark. For those who have plenty both of time and money the best route is *via* Antwerp and Luxembourg to Trèves, thence, by steamer, with an occasional tramp on foot, down the Moselle to Coblenz. Thence back to Bonn or Cologne and up the Rhine by steamer to Mayence, by rail, *via* Frankfurt and Nuremberg to Passau, then by steamer, in three days, to Budapest, halting at Linz and Vienna. From Budapest, a side trip to the Transylvanian Carpathians is well worth the trouble, and the return journey may be made either round by Fiume, Trieste, Innsbruck, and Munich, or through the valley of the Waag to Oderberg, and so on to Berlin. But this, to be properly enjoyed, would require several weeks, and for those whose time is limited, a return ticket to Vienna, costing less than eight pounds, and a steamboat run down the Danube to the capital of Hungary, will in themselves form a most enjoyable excursion.

## RETOUCHING.

*After Shakespeare (a long way).*

RETOUCH, or not retouch? that is the question,—  
Whether 'tis nearer to the truth to leave the  
Marks and wrinkles of approaching age,  
Or to take brush and pencil and retouch,  
And by disguising hide them? to spot, to shade,  
No more, and by some skill to say we end  
The heartaches and annoyances  
That sitters feel; 'tis a consummation  
Devoutly to be wished. To spot, to touch,  
Retouch, perchance to beautify—ay, there's the rub.  
For in retouching what youth restore,  
And shades and markings of old age destroy,  
Must give delight. There's the great skill  
That makes retouching so desirable;  
For who would bear the lines and freckles,  
Scars, pimples, and deep shadows,  
A twisted mouth, thick nose, and crooked eyes,  
With features all irregularly plain,  
When by the pencil's skilful power  
They might be beautiful for ever?

## The Picture Galleries.

### TWO BRILLIANT CONVERSAZIONI.

By "LOITERER."

BRAIN-LAND's inhabitants journeyed to the West last Wednesday evening. Before the carriages had rolled up to Buckingham Palace for the State concert there had been hundreds of arrivals at the South Kensington Museum, on the occasion of the *conversazione* given by the Council of the Society of Arts. Simultaneously, crowds of distinguished scientists, accompanied by intellectual ladies, were thronging Burlington House, where Sir William and Lady Thomson did the honours of the "Ladies' *Conversazione*" on behalf of the Royal Society.

Both functions were brilliant successes. Sir Richard Webster, Q.C., M.P., tried to forget that there was such a place as the House of Commons or such a legal conundrum as the Berkeley Peerage case. He received the guests of the Society of Arts with unfailing courtesy, and then put in an appearance at the State concert. Through the handsome halls of the South Kensington Museum the company passed to the North Court, where the band of the Grenadier Guards discoursed sweet music. Here we noticed Sir Philip Cunliffe Owen, Lord Bramwell—as great in science as in law, and happier in both than in the political arena—Sir Charles Lawson, Sir George Hayter Chubb, Sir Owen Tudor Burne, Sir Robert Rawlinson, Sir Henry Doulton, and many other distinguished gentlemen. Sir Henry Trueman Wood and Sir Frederick Abel, K.C.B.—the latter rejoicing in the latest addition of the Albert medal to his many honours—listened to the harmonies of the band, so ably conducted by Lieutenant Dan Godfrey. Sir Owen Roberts, Admiral Colomb, Mr. C. M. Kennedy, C.B., Mr. Charters White, Sir Rawson Rawson—these were among the brilliant throng. Ladies and gentlemen gazed at each other rather more than at the interesting contents of the cases in the Court, and then migrated to the lecture theatre, where samples of old English music were given, under the direction of Mr. Arnold Dolmetsch. When the strains of the lute and the harpsichord had ceased, the attractions of the Quadrangle led a multitude of hearers into the open air. Here the Scots Guards' band, under the baton of Mr. Edward Holland, rendered selections from the popular "Gondoliers" and various operas. The reflection of light from the surrounding Courts, the military costume of the band, the kaleidoscope of "fair women and brave men," added to the softened splendour of the summer evening, made the scene in the Quadrangle one of striking effect.

The company seemed to realise Guildenstern's idea of happiness in being happy, but not over happy. In the galleries, the Raphael cartoons were inspected with apparent pleasure, while the Sheepshanks collection and the Chantrey bequest each had admirers. Some striking costumes brightened the scene. Here a beautiful white dress trimmed with a chiffon of mauve attracted almost envious glances from the fair sex; there a charming harmony of dove-coloured silk with blue fichu; and everywhere bright faces showed the general delight.

At Burlington House there was the same fashionable crowd, but different exhibits. One saw Mrs. Henry Fawcett gazing at Prof. Silvanus Thompson's curious optical illusion. Parliament was represented by the Speaker of the House of Commons, Right Hon. Leonard Courtney, M.P., Sir Edward Clarke, Q.C., M.P., the Postmaster-General, and many others from St. Stephen's. Literature sent Mr. James Payn, Mr. Lewis Morris, Mrs. Oliphant, Mrs. Humphry Ward, and many other famous writers. Mr. H. M. Stanley was allowed a little more elbow room than last season; Sir Frederic Leighton, P.R.A., was quite at home in Burlington House. Judges in the persons of Sir Nathaniel Lindley, Mr. Justice Kay, Chief Justice Morris, and Baron Pollock, all seemed interested in the ingenious collection of curiosities. Mr. Edward Whymper sent some of the splendid engravings for his work "Travels among the Great Andes of the Equator." Meteorological photographs were lent by Mr. Arthur W. Clayden, and photographs of volcanic phenomena were exhibited by Dr. Tempest Anderson. A special feature was the connection by telephone with the Gaiety Theatre at Manchester.

The evening was well suited to its occupations, and thousands of persons returned to their homes more than satisfied with the entertainment provided by both the Royal Society and the Society of Arts.

## Notes from the Edinburgh Centre.

(From our own Correspondent.)

THAT hive of photographic activity, the Edinburgh University Photographic Society, met at No. 11, Chambers Street, Edinburgh, on the evening of Monday, 15th inst. Dr. Drinkwater, than whom a better President could not be found, occupied the chair, and, as became an energetic President, he showed the way by submitting for inspection a series of silver prints on which he had been experimenting. From an art point of view, he said the ordinary colour of silver photographs is objectionable, and he had endeavoured to produce a red tone, like the Bartolozzi. First he tried uranium, but it did not give the real Bartolozzi, and, besides, it was not permanent. He then tried a strong solution of common salt, and it produced, not the real Bartolozzi, but a tone as near it probably as silver was capable of giving. The way he worked it was this—the prints were turned over in the solution until they were thoroughly soaked, then they got one rinse in clear water and were at once put into a gold and borax solution. You would fancy they were hardly toning at all, while they were toning all the time. He used richly sensitised paper, and let them remain in the bath for about a quarter of an hour. The specimens shown by Dr. Drinkwater were a rich red tone, and certainly a great improvement upon any of the ordinary silver tones. He was highly complimented on the success of his experiment, particularly considering the simplicity of it.

### COLOUR-CORRECT PHOTOGRAPHY.

Dr. J. R. Paterson then made a communication on colour photography. They could, he said, produce a photograph in almost any single colour they pleased, but they were still striving to discover a process for the production of photographs in multi-colour. Dr. Paterson gave a narrative of the attempts to produce coloured photographs, and said it would be interesting to find out, from the records of the Patent Office, how many sanguine inventors had rashly rushed to expend their guineas in the full expectation that they had at last discovered colour photography. But in spite of all the progress that had then been made, a practical process of colour photography had still to be found. Two methods were usually employed, the one of which was chromo-photo-lithography, and the other worked by means of the lantern. Of chromo-photo-lithography, notwithstanding that a great deal had been written, little was known, some of the workers not having described their process. The principle of the process was the well-known one that sensitised gelatine, after exposure, took up a greasy ink, and several negatives were made of each picture, through tinted glasses which shut out certain of the colours, and from which the printing was done. Dr. Paterson showed, as produced by this process, the coloured picture which appeared in the *Photographic Quarterly* in the spring of last year. He described Albert and Vidal's process, and Obernetter's dusting-on process, and mentioned that of Hirsch, of Munich, by which similar results are obtained. Speaking of the lantern methods, he referred to the ingenious process of Ives, of Philadelphia, in which three differently tinted glasses are employed to produce different negatives, from which a positive is made. It was not a practicable process, the great difficulty being to get the colour balanced. Quite recently the Verak camera had been invented, which worked by means of four coloured glasses. A negative was made through each glass, and then, by different lenses, the four were focussed together on the screen. In the last place Dr. Paterson introduced M. Lippman's process, with which he had experimented. The process, he said, was based on principles that had long been known. There was no chance in the discovery of the process; it was all deduced logically from facts. The process was simple, but, unfortunately, it was only in an experimental stage, and was wholly unpractical outside the laboratory. Dr. Paterson explained how the plates are prepared, and he showed a plate which he had exposed under coloured glass. The result, he stated, of the exposure in Lippman's process was to produce a positive. The exposure required to be a very long one; M. Lippman said about an hour and a half on a very bright day. Dr. Paterson's specimen was looked upon with interest, and he was thanked for his communication.

**Dark-Room.**—Mr. John Piggott, who is nothing if not up to time, advises us that he has placed a "dark-room" at the disposal of amateur photographers at 117, Cheapside, E.C.

## Quarterly Examinations in Photography.

**Question 31.**—Write a brief note on the influence of development on gradation.

**ANSWER.**—This question is at the present moment the battlefield amongst those who are authorities in photographic matters.

Mr. Lyonel Clark first called attention to the amount of detail developable was always the same, the difference being in the time required by the different developers to produce it; but since then Messrs. Hurter and Driffield have published some of the results of a long series of experiments, showing that the amount of silver deposited is in ratio to exposure, no matter what developer is used, and hence they conclude the operator has no power to alter the gradation. This theory has started the battle, and seems to have been arrived at without due consideration, as it is in opposition to all previous experience, as the following experiment shows:—

A plate (the more rapid the better) is slightly over-exposed, cut into two, and developed, first half with pyro, 2 gr., bromide  $\frac{1}{2}$  gr., ammonia 3 minims, water 1 oz.; second half with pyro 2 grs., bromide  $\frac{1}{2}$  gr., ammonia  $\frac{1}{2}$  minim, water 1 oz.; both being developed until the same amount of detail in the shadows is visible (the second developer requiring a much longer time), and the prints resulting compared.

It will be found that the first print is flat, while the second is harsh with strong contrasts, the high lights being almost entirely blocked.

In a paper in the *Photographic Reporter* (I think for June) attention is called to the results found by M. Angerer, of Paris, as to the different densities given by different developers, while Professor Burton is responsible for the statement that pyro followed by eikonogen gives very different gradation to either of them alone, but that reversing the order has little or no effect.

S. N.

**Question 32.**—How would you restore a yellow albumen print?

**ANSWER.**—The first question is, in what stage is the print, and how has it become yellow?

(a) If yellow or discoloured from being kept too long before toning, they may be restored by being well washed in a bath of ammonia 2 per cent. and water, and the same amount of ammonia should be added to the fixing bath.

(b) If yellow from sulphur from an acid fixing bath, they are best destroyed, as the results are always unsatisfactory.

(c) If yellow from age, they may be bleached in a bath of—

Chloride of lime .....  $\frac{1}{4}$  lb.

Carbonate of soda .....  $\frac{1}{4}$  "

Water ..... 1 quart

until the print has regained its proper tint, when it required to be washed for some six hours in running water.

S. N.

**Question 33.**—Is there any difference in the resulting tint of a bromide print, when the paper is exposed at 2 ft. or 6 ft. from the source of light? How would you calculate the exposures required at the latter distance, that at the former being known?

**ANSWER.**—The answer to this question depends on two things: the light employed, and the negative. The slow action of light does give a very different tone to its rapid action, but when the lesser exposure is much prolonged, owing to the density of the negative or the dimness of the light, this difference is reduced to a minimum. Thus with a negative which requires at 2 ft. from a given light five seconds' exposure, a very different tone will be obtained by giving 45 secs. at 6 ft., or better still by giving 80 secs. at 8 ft.; but with a negative requiring 90 secs. at 2 ft., an exposure of 15 minutes at 6 ft. will make a trifling, though quite perceptible, difference. The result of my experiments is that bromide prints should receive at least two minutes' exposure if a good platinotype black tone is required, and so long as with a given negative and light, this or a longer exposure is right, the difference between an exposure at 2 ft. or 6 ft. will not be large. But when at 2 ft. the exposure is only a few seconds, then at 6 ft. the tint will be much better.

The exposure varies as the square of the distance. The square of 2 is 4, the square of 6 is 36. The exposure at 6 ft. will be nine times that at 2 ft.

R. C. M.

### QUESTIONS.

37. Give a process for obtaining a negative directly from a negative.  
38. What are the probable causes of blisters in prints? and state the remedies.

39. Describe the process of photography.

(Latest day for Answers, July 6th.)

### RULES.

1. Answers must be received on the morning of the Monday week following the publication of the question.
2. All answers must be preceded by the question, and should be written on one side of the paper only, and each answer must be on a separate sheet or sheets.
3. A *nom de plume* may be used, and must follow every answer, but in every case the full name and address must be written on the back.

4. Answers must not exceed 250 words, unless otherwise stated by the examiners, and the number of words in each answer must be written at the bottom of the same. Competitors disregarding this rule will not be awarded marks.

5. Those desirous of competing must apply to have their names entered, as these examinations are intended to encourage the study of the theory and practice of photography. Authorities upon photographic matters and contributors to the photographic journals will not be allowed to compete.

**NOTE.**—No information of any kind will be given to competitors upon the questions set, and nothing but the answers must be included for the examiners; all other communications must be addressed to the Editor.

Marks will be given for all answers, and when possible, the three best answers will be published. Three prizes will be awarded at the end of each quarter.

All communications to be addressed:—

"EXAMINATION DEPARTMENT," AMATEUR PHOTOGRAPHER,  
1, CREED LANE, LONDON, E.C.

## Reviews.

*Fallowfield's Photographic Annual* for 1891 has just come to hand. The first part consists of a profusely illustrated catalogue of the goods in which Mr. Fallowfield deals, cameras, lenses, plates, paper, mounts, etc. Next comes a list of the makers' formulæ for developing the various brands of dry plates; for intensification and reduction; and also for treating platino-type, bromide, and other similar papers. A table of tests for impurities in photographic chemicals will be found useful, as will also the conversion of French into English weights and measures. The last part of the book is devoted to 156 hints, gathered from many sources, and dealing with all branches of the art-science. The book is well got up and is of a convenient size.

**Christchurch, Hants.**—Many of our readers will be interested to know that Mr. Alfred Mallett, High Street, Christchurch, has fitted up a dark-room. Visitors to Bournemouth usually make a pilgrimage to Christchurch, and, if photographers, may be glad of the use of a dark-room.

**Mr. William Hume**, of Lothian Street, Edinburgh, has sent us a copy of his very excellently illustrated catalogue, containing some sixty-four pages of useful matter, descriptive of the goods sold by him. We commend to our readers the quotation, culled from Mr. Goschen's Budget speech of 1891, with which Mr. Hume prefaces his catalogue, "It is no longer better to buy in the cheapest market but in the best." In cameras we note the "Universal," fitted with turntable, rising front, vertical and horizontal swing-back. It will work with the shortest focus lenses, or may be racked out to carry long-focus lenses. The "Field" and "Tourist's" cameras are both useful types. Special apparatus for photo-micrography are worth attention. Perhaps the most successful of Mr. Hume's many inventions is his Cantilever enlarging apparatus, in which the light is equally distributed all over the picture, giving no shadows or flares. The mechanical parts are easily accessible, and we thoroughly endorse the words of the maker, that "the whole of the apparatus is compact, substantial, and well finished." Intending purchasers should see the "Cantilever." Mr. Hume has a special form, which he names the "Indian Pattern;" this is designed and constructed to withstand the attacks of insects and the moist heat of tropical climates. The amount of woodwork is reduced to the smallest proportion. The "Cantilever" when fitted with 4 in. condensers forms a most admirable and compact projection lantern and is particularly easy to manipulate. We note a useful "Developing Bench," which can be used either by professional or amateur. The bench is  $4\frac{1}{2}$  ft. long by  $2\frac{1}{2}$  ft. broad, and stands 3 ft. high, with lead-lined, shallow sink, 24 by 20, horizontal shelves below to hold large or small trays, and narrow shelves above for bottles, etc. This is sold at £3 10s., or fitted with water and gas fittings, £6 10s. We know from practical experience the comfort of these developing benches, and always strongly advise their use. All the best makes of lenses are stocked, view finders, focussing lenses, etc. Shutters of various makers are on sale, but when last at Edinburgh we were much pleased with "Hume's New Timing Shutter," which opens and closes at the centre, and gives prolonged exposures at the will of the operator, so long as the pneumatic ball is compressed. Dark-room accessories of almost every kind will be found upon Mr. Hume's extensive premises. Plates, mounts, chemicals, etc., of the best are stocked. To our subscribers north of the border, the name of Hume is too well known to need any word from us, but to those of our readers who are going north for their holidays, we would strongly advise them to pay Mr. Hume a visit. There will be no need for them to cumber themselves with photographic impedimenta. Mr. Hume can supply all their wants, and we can assure them that he will give a hearty welcome to any visitor from the south. His catalogue has the distinct advantage of containing what is wanted, and not an enormous mass of paper and print that is often only a hindrance when it was meant to be a help.

# "Amateur Photographer" Dark-Rooms, 1891.

THE "DARK-ROOMS" kindly placed at our service for the use of amateur photographers are classed as follows:—

- a* Amateur *d* Dealer or professional.  
*h* Hotel *s* Photographic society.

APPLICATIONS for letters of introduction must be accompanied by **three penny stamps**. Full particulars are given as to charges (if any); plates, chemicals, etc., kept in stock by dealers; terms for temporary membership of societies, etc., etc.

THE OWNER of Dark-Room will be advised by same post as the applicant. In order to prevent delay, all applications should be addressed to the Editor, AMATEUR PHOTOGRAPHER, 1, Creed Lane, London, E.C., and *plainly* endorsed "Dark-Rooms."

CONTINENTAL DARK-ROOMS.—Information can be supplied respecting many Dark-Rooms on the Continent, and addresses given of firms who stock photographic materials.

## Societies' Meetings.

**Ashton-under-Lyne.**—On the 13th inst. eighteen members of this society, under the leadership of Mr. J. W. Kenworthy, journeyed to Haddon Hall, taking conveyances from the station. The party were soon photographing the interior and exterior of this noble place. The time pressing, the company adjourned to one of the outer buildings of the hall to partake of refreshment, and afterwards the party walked along the river side to Rowsley, taking several views on the way. Arriving at the station about 7.30, a special train was fortunately stopped, the members getting home at 9.30, instead of 11.30 p.m. On Thursday last, at the club premises, Mr. W. Chadwick showed some good negatives of the Ilkley district, developed with pyro and soda; Mr. W. Mackley, negatives; Mr. C. Lord, stereo transparencies, and the Secretary, opalines. Messrs. Marion and Co. have presented the society with two specimen plates. Next out, June 27th, Gawsworth; leader, Mr. C. E. Redfern.

**Bedford.**—At the ordinary meeting on the 16th inst., the President in the chair, Mr. Perrott Smith read a paper on "Kallotype," giving a clear and concise description of the process, and demonstrating its various stages. The members present took much interest in the subject, and several questions were asked and answered. The rich sepia tones obtainable by the new process met with general approval. The great recommendation of the process appears to be its economy—the expense of working it being smaller than any other capable of giving equally good artistic results. But being, as the President remarked, a silver process, it must necessarily share the failing—want of permanence—from which platinotype is so pre-eminently free. A cordial vote of thanks to Mr. Perrott Smith for his excellent paper brought the meeting to a close.

**Dewsbury.**—An ordinary meeting was held on the 11th inst. Mr. C. Naylor (Vice-President) in the chair. No paper being down for this evening, a goodly number of members brought prints and transparencies for inspection. The Secretary showed a negative taken on one of Marion's sample Britannia plates, and developed with pyro, meta-bisulphite of soda, and common washing soda. The negative was much admired, being all that one could desire. The rest of the evening was spent in a social manner, various subjects coming in for a share of comment.

**Dorset.**—The third meeting of the season for field work was held at Shaftesbury on the 17th inst. Proceedings commenced with the exposure of plates in the town, the old church and the Abbey walls being paid due attention to. After lunch the Hon. Secretary (Rev. T. Perkins) read a paper on "Pinhole Photography," and showed several examples of pictures taken by himself without a lens. The party then drove through Semley and the Vale of Wardour, when many excellent subjects were found; to the ruins of Old Wardour Castle, where every remaining plate was exposed on views of the ruins and magnificent cedars, without exhausting the photographic possibilities of the place.

**East London.**—A general meeting was held on the 15th inst. at 333, Old Street, E.C., present head-quarters, when the retiring Secretary (Mr. H. G. Wallis) was elected one of the Vice-Presidents of the Society. Mr. M. A. Wilkinson was elected as Secretary.

**Faversham.**—The monthly meeting was held on the 16th inst.

eleven members being present, and Dr. Evers presiding. The subject for the evening was inspection and comparison of photographic apparatus, including cameras, lenses, instantaneous shutters, dark slides, focussing cloths, view finders, print and plate washers, and many other useful accessories too numerous to mention. It was resolved that the Society procure an album in which should be placed one photograph taken by each member attending the several excursions. Captain Hooper kindly offered to present the Society with another album for the purpose of receiving photographs of special interest or merit. A number of photographs taken at the late excursion were exhibited and criticised.

**Glenalmond.**—At the fortnightly meeting the President took the chair. It was decided that the photographs for the two competitions which the club have now on hand should be sent in by July 11th. Mr. Craig then reviewed the work of the club during the last year. A discussion took place as to whether the club had increased in energy or not. After several things had been pointed out by the President and other members, it was unanimously agreed that the energy had certainly increased. Mr. Johnstone then showed an Eclipse hand-camera, and the President a new travelling lamp. The meeting then inspected some photographs by the President and Mr. Johnstone.

**Holborn.**—The meeting on the 19th inst. proved an exceedingly instructive evening. Mr. E. H. Bayston took the chair. Mr. Frederick J. Cobb demonstrated first on silver printing. He gave a short history of the process, which he thought was the most popular among amateurs, although of late years the numerous processes which had been introduced had tended, to a certain extent, to decrease its popularity. He gave a few hints on keeping the paper, which, he said, would keep for a considerable time; even after printing, if the print was well washed, it would keep for an indefinite period. He always used the acetate toning bath, which was, in his opinion, the best that could be used. An old bath would work much better than a new one. He toned a few prints with the acetate bath, which worked exceedingly well. Mr. A. J. Golding then demonstrated on gelatino-chloride and silver emulsion paper. The extreme simplicity of the working of this paper recommended itself to all amateurs. He had never met with any great success in ordinary silver printing, but he had obtained, without any trouble, excellent results on this paper. The depth of printing depended, to a great extent, upon the method of finishing the print. If it was finished with a matt surface, it need not be printed so deep as if it was to be enamelled. After printing, the prints should be well washed and placed in a 10 per cent. solution of chrome alum, to harden the film. The time the print should be left in the bath depended upon the temperature; the warmer the air, the more time it should be left in the bath. He used the following toning bath:—Dissolve 2½ drachms of sulphocyanide of ammonium in 16 ozs. of water, and one day before it was intended to use the bath, add 3 drachms of a 15 drachm gold solution. He believed in quick toning, because they were dealing with a delicate surface which would not stand much handling. The richness of the tone depended upon the amount of sulphocyanide of ammonium in the bath. The fixing bath was 2 oz. of hypo to 20 oz. of water, leaving the prints in about ten minutes. He had not noticed any loss of tone while in the fixing bath. With regard to the final washing, he thought two hours would be sufficient. In his opinion the prints did not require so much washing as ordinary silver printing, because the hypo was on the surface and not soaked in the albumen. The print could be finished with a matt surface or enamel, by using plate-glass for the latter, or ground-glass for the former. The glass, after being thoroughly cleaned, was dusted with talc, and the print squeegeed down, and peeled off when dry. Starch was the best mountant. If the print was finished with an enamel surface, mounting was exceedingly difficult. The prints, after being squeegeed down, should be backed with the piece of waterproof paper which came off with the print, and prevented the moisture from the mountant going through the paper, and affecting the enamel surface of the paper. He then toned and fixed some prints on Obernetter and Liesegang's Aristotype, together with one which had been printed some twelve months ago on Fallowfield's paper, all turning out splendid. This he followed up by finishing off some prints with a matt surface. The Chairman said he had tried both processes. With regard to preserving silver paper, an old piece of sensitised paper placed with the other paper was an excellent preservative. When squeegeeing down an Aristotype print on to glass a great difficulty was to get rid of the air-bubbles. He had found that if a pool of water was left on the glass, and the print placed in the pool, no air bubbles would result. Mr. Herbert Thompson said he could quite concur in Mr. Golding's remarks on the simplicity of the working of the paper over ordinary silver paper. He did not recommend the use of chrome alum, but ordinary alum, as the former was liable to give a green colour to the whites. With regard to washing, he thought Aristotype prints would require more than ordinary silver prints, as hypo, in his opinion, seemed to cling most tenaciously to gelatine. Mr. G.

Luxton said the best way of thoroughly cleaning glass plates was to use the following: Photographic tripoli, methylated spirits, and water. The quantity of each could easily be ascertained. Mr. A. G. Golding said, with regard to air bubbles, if after the print had been peeled from the glass it was found that air bubbles had been present, the print could be washed in water, and squeegeed down on the glass again.

**Jersey.**—Taking advantage of the weather, which has been more seasonable than in England, this Society has commenced its excursions early, and have repeated them often, so that before long it will be necessary to emigrate for novelties. On May the 18th the rendezvous was "The Weighbridge" for St. Heliers Harbour and shipping bits. On June 5th a drive took place across the island, *via* Millbrook and the famous Vinchelez Lane, to the ruins of Grosnez and the caves of Plemont, whence all returned contented with every plate exposed. Lastly, as all the previous five excursions had been chiefly by the sea, on the 17th inst., an excursion was arranged to investigate the artistic capabilities of St. Lawrence Valley and its mills. In each of the competitions arising out of the excursions just mentioned, Colonel Jackson has secured the largest aggregate of votes, and also secured the club certificates for the best picture taken on the last two excursions. For the Harbour excursion, Mr. Hammond Spencer came first, and for the St. Lawrence Valley excursion Miss Le Cornu was a good second. It has been decided that the gold medal of the Society be given for the highest aggregate obtained at excursion competitions, but to equalise the chances of members unable to attend all excursions, one half the total number of excursions is to be the maximum number of scores to be sent in by each competitor. There has been only one paper read this month—thoroughly practical—by Colonel Jackson, on "Silver Printing and the Sensitising of Albumenised Papers." Three new members have been elected, Miss Croft, Miss Le Gallais, and Capt. Swan. The next excursion is to be to L'Etac on July 5th, at 3.

**Lewisham.**—On the 19th inst., Mr. Castle in the chair, the members who turned up to hear Mr. Child on "Chinese Artists" were amply rewarded, as the lecture proved very interesting. Mr. Child brought with him pictures, bronzes, china, and numerous other works of art, which he fully described. Among other things he drew attention to the fact that the Chinese always reversed the perspective in their drawings. Another curious thing about them was that they would not have their portraits taken during life, but when dead their relatives called in several artists who have to draw from memory, the one who most correctly delineated their attire being finally chosen. The face was quite left out of the consideration. Next meeting, July 3rd, "Exposure," Mr. E. Eastwood.

**Lowestoft and District.**—A meeting was held on the 19th inst., Mr. W. Stringfield, in the absence of Mr. F. Mayhew, presiding. After the election of members, several topics arose for discussion, amongst them, that of development, and it seemed to be the general opinion that pyro and ammonia afforded the best results. Some few supported hydroquinone, but admitted that negatives produced thereby did not print so satisfactorily. Several prints and negatives were passed round for inspection by Messrs. F. W. Emuse, J. Rose, and A. M. Smith. Mr. Stringfield showed a few good lantern slides, principally interiors.

**Newcastle-on-Tyne.**—The second outdoor meeting was held on the 18th inst., the venue being Ripon and Studley Park. With the exception of the wind being rather troublesome at times, the day was a perfect one. After breakfast at Ripon, the party, numbering twenty-three, under the leadership of Mr. M. Auty, of Tynemouth, took breaks to Studley Park, where a most enjoyable time was spent, and over two hundred plates exposed, mostly upon the old ruins at Fountains Abbey. Dinner at the "Black Bull" Hotel, Ripon, concluded a very pleasant day's outing.

**North London.**—At the meeting on the 16th inst., Mr. A. Mackie in the chair, Mr. Hudson demonstrated with his new patent continuous flash lamp "The Kolm." After all the arrangements were complete, and Mr. Hudson had explained the whole to the members, he took two very successful negatives of the Chairman and one of the members, and, further to test the capabilities of the lamp, at the request of some of the members he took an excellent negative of a group of all the members present. The negatives were developed by the Chairman, and turned out to be equal to anything taken by daylight, the exposure, quality, and lighting being all that could be desired. The negatives are to be printed from by Mr. Oakley, and shown to the members at their next meeting. A member exhibited a number of negatives, his first attempt at hand-camera work, which he had failed to develop properly with the hydroquinone developer, and asked the reason of his failure. The Chairman replied that it was always a good plan so to make up the developer that one was able to say at once what were the relative proportions of the various constituents, instead of simply saying, these were developed with hydroquinone, or those with pyro and ammonia, etc.; and in order to make it clear what was meant by 10 per cent. solutions, he wrote the following formula on the black-board:—

#### 10 per Cent. Pyro.

Pyro .....	1 oz. bottle.
Citric acid .....	60 grs.
Sulphite of soda .....	3 oz.
Water, to make .....	9½ oz.

Dissolve the sulphite in some water, add the citric, then pour it into the pyro, and when the latter is dissolved pour the whole into a measure and fill up to 9½ ozs. exactly.

#### 10 per Cent. Bromide.

Bromide of potassium .....	1 oz.
Water, to make .....	9½ oz.

#### 10 per Cent. Ammonia.

Ammonia .....	1 oz.
Water, to make .....	10 oz.

#### 10 per Cent. Soda.

Anhydrous carbonate of soda .....	1 oz.
Water, to make .....	10 oz.

For pyro ammonia developer, take 20 minims pyro, 10 minims bromide, 20 minims ammonia, water 1 oz. For pyro and soda developer, take 20 minims pyro, 120 minims soda, water to make 1 oz. The next meeting will be on Tuesday, July 7th, when, as Mr. Dando cannot give his promised demonstration on "The Collodio-Bromide Process," the Hon. Secretary will read a paper on "Leaves from my Note-Book, and How I Use them."

**Photographic Society.**—At the meeting on the 9th inst., Mr. J. Glaisher, F.R.S., President, in the chair, Messrs. F. W. Harrold, J. Howson, and T. R. Shervinton were elected members of the Society. Six new candidates were proposed. It was announced that twenty-eight books had been presented to the Society's library by Messrs. W. Vanner, G. H. Shepherd, L. Warnerke, and F. D. Cembrano, junr. Captain W. de W. Abney, F.R.S., read a paper on "An Undiscussed Point, the Illumination of the Dark Room." In this paper the author showed that the law of inverse squares did not hold good when lights equal to the one-millionth of a candle are used. He said the reason why the dark corners of a room lighted by canary medium were better illuminated than when the illuminator was that of ruby glass was that the former had five times greater penetrating power than the latter. Mr. J. Spiller enquired whether it would not be better to use green as the danger signal on our railway lines. Captain Abney said these experiments did not apply to signal lights; and in foggy weather green light appeared white to the eye owing to the blue rays being cut off. The Secretary drew attention to the Holiday Candle Lamp kindly presented to the Society by Messrs. Benham and Froud.

**Richmond.**—An excursion to Shepperton was arranged for the 13th inst. Only three members turned up, who found some excellent subjects in the neighbourhood. The ordinary meeting was held on the 19th inst., Mr. Davis in the chair, when the subject for discussion was "Tourist Kits."

**Southport Social.**—On the 17th inst. Mr. Cross commenced a series of demonstrations on "Printing." The various printing processes are intended to be gone through fully, and ought to prove valuable to the members. The first was "silver" printing, and a vote of thanks was passed to Mr. Cross for the very able manner in which he explained numerous "dodges," etc., which were well illustrated by prints taken for the purpose from faulty negatives. The society still continues to increase, therefore a good exhibition is expected in October.

**"Answers" and Photography.**—Amateur photographers often favour me with specimens of their work, and this week I have to thank "Amateur Photographer," who sends me from Parkfield Vicarage, Middleton, Manchester, a charming copy of our coloured plate; and also a gentleman at Teignmouth, who has photographed his pretty little baby daughter looking at one of our papers through a huge pair of spectacles.

**Burnet's Essays.**—A correspondent writes: "A few weeks ago I took up a number of the AMATEUR PHOTOGRAPHER at a dealer's shop, while waiting to be served, and was much struck with an excellent republication of Burnet's Essays on Art, ably edited by Mr. H. P. Robinson. I at once ordered all the back numbers for the year, and entered my name as a regular subscriber, and I must thank you for the great pleasure and benefit which I have derived from a perusal of your journal, and particularly the articles referred to."

**Flashlight.**—Herr Putz informs the Vienna Photographic Society that he uses aluminium as a substitute for magnesium to produce an intense actinic light such as photographers require. He first tried mixing the aluminium in powder with chlorate of potash and sulphide of antimony; but as that produced an objectionable smoke, the antimony was dispensed with, and a good result was obtained. He also tried thin leaves of aluminium between sheets of collodion cotton impregnated with chlorate of potash, which gives a brilliant light without any smoke at all.

## To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for these columns are to be addressed to **The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.**

### RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or Answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S** Post.
5. The Editor does not undertake to answer questions by post.
6. In answering Queries, correspondents are requested to mention, in every instance, the number and full title of the query referred to.

## QUERIES.

4793. **Developing.**—I am told to develop with Beach's developer until the negative becomes dark. Am I to continue to develop, say a figure with black coat, until the white appearance of the coat disappears and it becomes nearly same as collar, fine and other parts which will eventually be white, but which on negative are black?—J. T. H.

4791. **Pinholes on Negatives.**—How can I avoid these? I brush plate before developing, and use filtered water with bath; but wash with tap water. I use Ilford plates.—J. T. H.

4792. **Hastings.**—I should be glad of a few hints about views to be taken in and around Hastings, also the best time and positions to take them in July. Any information would be very acceptable, more especially from amateurs who are residents.—F. W. REYNOLDS, Aberdeen House, Camberwell Station Road, S.E. [Note: See article in AMATEUR PHOTOGRAPHER, June 8th, 1888.—ED.]

4793. **Taupenat.**—Will some reader please state the formula for Taupenat's collodio-albumen process? also Mr. Ackland's modification?—ANON.

4794. **Snap-Shot Developer.**—In making up the snap-shot developer mentioned on page 337, I had not seen the correction which was made in a later issue, that the citric acid was 15 grains and not grammes as was printed, and, therefore, I put in 15 grammes, with the result, of course, that it would not work at all, and also, there were evolved fumes somewhat similar in smell to strong acetic acid and which produced violent coughing. What would this be from, and what gas is it? If any reader can throw further light on it, I shall be obliged.—JOHN R. WILLIAMSON.

4795. **One-Solution Intensifier.**—Wanted, a formula for the above, one that will keep and will reduce the negative to a deep orange brown. There is such an one, but I cannot get hold of the formula.—J. H. J.

4796. **Colouring Transparencies.**—Would any reader kindly explain how to colour photographic transparencies for magic-lantern slides, indicating what colour is used and the medium, etc.?—OXY-HYDRO.

4797. **Drink Traffic.**—Could any reader supply copies of negatives or transparencies for magic-lantern slides, showing the ravages caused by the drink traffic, suitable for illustrating free lectures to young people?—PYRO.

4798. **Bromide Paper.**—I shall be glad to learn what success any of your readers have had with the Ilford hydroquinone formula (1 oz. No. 1, 1 oz. No. 2, and 1 oz. water) with this paper. Having failed with it, I should like to hear the experience of others before trying another formula.—MUWA.

4799. **Exposure Meter.**—Could any reader in the Edinburgh centre kindly tell me the name of the exposure meter mentioned by Mr. F. Dundas Todd at the closing meeting for the season of the Edinburgh Photographic Society on 3rd inst.? Also where to get it and its price, and its relative rapidity to ordinary Ilford plates.—INSTANTOGRAPH.

4800. **"Work," Last Vol. of.**—Will some reader kindly inform me in what numbers of the last volume of "Work" instructions were given for making a case for quarter-plate Instantograph so as to use it as a hand-camera?—INSTANTOGRAPH.

4801. **New Zealand, Camera for.**—I intend shortly to return to New Zealand, and want to take my camera (Underwood's Instanto) and slides. What is the best

way to take them through the tropics without danger from warping, etc.? Should I have them brass-bound, or is there some way of wrapping them in oiled paper and enclosing in a tin box?—KAIKOURA.

4802. **Shutter.**—Will any amateur kindly inform me if Tylar's Norden flap shutter is a reliable one, and whether it is free from vibration?—POOR OLD ALF.

4803. **Cromer.**—Would someone kindly give me an address of a farmhouse or cottage about two miles inland from Cromer, suitable for spending holiday with the camera, and oblige?—VICTOR.

4804. **Henley.**—Would some brother amateur be kind enough to allow me the use of his dark-room for the purpose of changing plates during Henley Regatta, as I have only one dark-slide, and wish to take several pictures?—F. W. ROWE.

4805. **Isle of Man.**—I am going, next week, to the island for a few weeks. Will anyone tell me where I shall find some pretty bits for the camera? I expect to be at Douglas, Ramsey, Port Erin, etc. Is there a dark-room for use of amateurs at any of these, and can Ilford plates be obtained? Any hints will be gratefully received.—X. [Note.—There are several dark-rooms at Douglas; see our list. For "pretty bits," see AMATEUR PHOTOGRAPHER of September 16th, 1887, and June 15th, 1888.—ED: AM: PAOT:J]

4806. **Warwickshire.**—I should be glad to know if permission to photograph is required for the following places, and if so, where it can be obtained: Warwick Castle, Kenilworth Castle, Guy's Cliff, Stratford-on-Avon Church (interior). I understand there are a number of picturesque moated houses in the county, and would be glad to know where to find any in the neighbourhood of Warwick or Kenilworth. Also any information as to picturesque or half-timbered cottages, farmhouses, or villages in same district.—J. G. PATTERSON.

4807. **Norway.**—I am thinking of spending my holidays in Norway. Will someone kindly say whether I shall find plates of ordinary rapidity or quick plates (instantaneous) most in requisition for general photography? Any hints most acceptable.—A. T. B.

4808. **Changing Bag.**—Will someone please tell me of a good whole-plate changing bag for changing dry plates, and where I can get same?—A. T. B.

4809. **Wheeler's Exposure Tables.**—I use Wheeler's exposure tables, and find them a fairly good guide, but I am puzzled how to ascertain the relative rapidity of different brands of plates. The tables are calculated, for "10 times" plates, up to "60 times," and Ilford ordinary are put at "30 times." Can any of your readers kindly say how many "times" (the expression seems to me a clumsy one) some of the leading brands should be estimated at? In particular, Ilford rapid and extra-rapid, Edwards' isochromatic, and Thomas's.—GRINGO.

4810. **Fogged Plate.**—When a plate is slightly fogged by exposure to light during fixing, how can the fog be got rid of?—GRINGO.

4811. **Alpenstock Stand.**—I shall feel obliged if someone who has had experience with this advise me as to the best alpenstock stand for a hand-camera (quarter-plate), one that combines good height, reasonable lightness, and perfect rigidity?—H. S.

4812. **Rotterdam and The Hague.**—I am thinking of going to Antwerp, The Hague, and Rotterdam shortly. Would any reader kindly advise me which would be best to take, the ordinary camera and tripod, or a quarter-plate hand-camera, as I have both; also where could Ilford plates be got, or should I have to take them? Also a hint as to the exposure; is it quicker than here? Would Ilford ordinary be quick enough?—IONA.

4813. **Norway or Scotland.**—Amateur, who contemplates making a tour in one of these countries (former preferred), of about 14 to 18 days' duration, starting about the middle or end of July, will be glad to meet with another amateur who would accompany him and share expenses, or would join a party. Can arrange for starting first week in August, if necessary.—TOURIST (address with Editor).

## QUERIES UNANSWERED.

May 29.—Nos. 4711, 4723.

June 5.—Nos. 4727, 4729, 4732, 4738, 4740, 4746, 4749, 4750.

" 12.—Nos. 4767, 4769.

" 19.—No. 4779.

## ANSWERS.

4772. **Blisters.**—Wash the prints as usual, and then dry between blotting paper under a moderate weight, and, on the prints drying, the blisters will all disappear. The day before I saw your query I had 12 half-plate prints covered with blisters, and they all disappeared on drying.—TASMA.

4775. **Cheap Reducer.**—Try the following:  
 Perchloride of iron .. .. 100 gr.  
 Bromide of potassium .. .. 60 "  
 Water .. .. 8 oz.

Place your negative in this for a few minutes, watching it carefully, wash and refix.—PONT0.

4776. **Varnish, how to Remove.**—Soak the negative in a dish of methylated spirit.—PAN.

4776. **Varnish, how to Remove.**—Soak the negative in methylated spirit, rub the varnish off when

quite soft with a pad of cotton, soak in fresh spirits, and dry.—PONT0.

4777. **Printing Processes.**—Celerotype paper is treated much like ordinary paper, while Kallitype is developed with nitrate of silver and citrate of soda. Pizzighelli platinum paper is the least trouble of any, with the exception of ferro-prussiate, but is nearly three times the cost of silver paper although the chemicals (common hydrochloric acid) cost next to nothing.—PONT0.

4777. **Printing Processes.**—S. Armstrong will find the Celerotype process very simple and no trouble. Printing is done the same way as ordinary silver printing; the paper is printed until the picture is deeper in tone than the finished picture. If S. Armstrong writes to the Blackfriars Photographic and Sensitising Company, 1, Surrey Row, Blackfriars, full particulars will be given. This paper is first-class where a burnisher is not required.—ALPERUM.

4778. **Ferro-Prussiate.**—The above paper cannot, to my knowledge, be turned black, but tones ranging from a copying-green to brown may be obtained by means of pyro and hypo in different quantities.—PONT0.

4780. **Broken Negative.**—If the glass is cracked without the film being torn, soak in weak hydrofluoric acid and water, and float on to a clean plate of glass. If the film is cracked, cement the pieces together on a plate of glass and keep it rotating whilst printing, and the crack will not show much.—PONT0.

4781. **Varnish, how to Make.**—Thin down white hard spirit varnish with twice its bulk of methylated spirit, or make the following:

Seed lac .. ..	120 grm.
Spirit .. ..	1 litre.

—PONT0.

4782. **Cleaning Bottles.**—Wash with hot hydrochloric acid (spirits of salts) and water, and then with hot water.—PONT0.

4782. **Cleaning Bottles.**—Purchase a Winchester quart of commercial sulphuric acid, price 1d. per pound. Put all your dirty bottles, glasses, and anything, in fact, that has no metal attachment on to the scullery sink, and fill them quite full of sulphuric acid. In half an hour turn the acid back, using a glass funnel, into the Winchester. Wash each well with cold water, and they will shine and sparkle like crystal. A Winchester quart will keep all the glass in the house perfectly clean for ten years. If you should slip any on to your clothes, have a small bottle of liquid ammonia at hand; but avoid splashing either into your eye, or your eye will smart.—T. H.

4783. **Quarter-Plate Hand-Camera.**—Yours is a rather formidable list of advantages, and I know of only one fulfilling them all, viz., the Talmer, which is advertised in these pages. There is also George Houghton and Son's Automatic camera, 9½ by 5½ by 4½, weighing 4½ lb., and costing £6 6s. with blind shutter and R.R. lens. The Kodak, quarter-plate size, is little over the dimensions given.—PONT0.

4783. **Quarter Plate Hand-Camera.**—The only hand-camera that will fulfill your somewhat exacting conditions is the new Talmer Euryscope automatic camera, which has the following special features:—(1) size, 9 by 5 by 5½; (2) weight without plates, 2 lbs.; (3) holds twelve quarter-plates; (4) simple and perfected changing of plates; (5) time or instantaneous exposures, effective self-setting adjustable speed shutter; (7) double exposure on one plate absolutely impossible (the changing of plate sets shutter for next); (8) high class rapid Euryscope rectilinear lens, Iris diaphragm adjusted from outside camera, focussing arrangement, and two finders. Makers.—Talbot and Eamer, Blackburn; price £5 5s.—L. BATEMAN.

4784. **Focussing.**—It is not possible, except by placing the background close to the subject or by using a small aperture.—PONT0.

4784. **Focussing.**—You should focus the principal object, or middle distance, as sharp as possible with the full aperture of your lens. Then stop down. If the background is not in focus with the smallest stop, your lens is not worth having. If you want the background in correct focus with full aperture, you must use the swing-back.—PEN.

4784. **Focussing.**—I think the best way to find out how to get both the object and background clear is by trying the various stops, remembering at the same time that the smaller stop you use the more exposure the plate will require. I think f/22 will be about the best stop.—W. H. ELLIS.

4785. **Dark Room, Highgate.**—In reply to G. Parker's query, I do not think there is any dark-room open to amateurs in or round about Highgate. The nearest photographic studio to Chetwynd Road, Highgate, is the Highgate Photographic Studio (J. Hounsell, proprietor), 7, Archway Road, Upper Holloway, N., where you might get permission to use a dark-room for a short time at a small charge.—W. H. ELLIS.

4786. **Reducing.**—See reply to 4775. Spirit cannot possibly have any effect on the density of the film.—PONT0.

4786. **Reducing.**—Make up a solution of hypo the ordinary strength for fixing negatives, also a weak solution of ferricyanide of potassium (say 5 per cent.). Take a camel's-hair brush, and well wet the part of the negative requiring reduction with the hypo solution; after several applications, brush on some of the ferricyanide, and you will observe rapid reduction. Brush on more hypo when sufficiently reduced, and then wash well.—PEN.

4787. **Developer for Ilford Plates.**—The formula described in "Beginner's" query is a fairly good developer, but requires more trouble, both in preparing and mixing for developing. Read my answer to Query No. 4757 in last week's AMATEUR PHOTOGRAPHER. To prepare the developer described is as follows: Take equal portions of each, water and the developer; for a half-plate it requires 2 oz. of developer and 2 oz. of water. This will develop four half-plates if developed one after the other, but if only one or two plates are required to be developed it may be put in a stoppered bottle, and will keep good for four days at the most.—W. H. ELLIS.

4787. **Developer for Ilford Plates.**—"Beginner" will do well to use the formula as follows:—

(1)	
Hydroquinone .. .. .	160 gr.
Bromide potassium .. .. .	30 "
Sulphite soda .. .. .	2 oz. av.
Water .. .. .	to 20 "
(2)	
Soda hydrate .. .. .	100 gr.
Water .. .. .	20 oz.

Have used this, and find it most suitable for a beginner. Get a photographic chemist to make it up for you. If you write me, through Editor, I will send you some for you to try ready mixed, or give you further particulars.—ALPERUM (address with Editor).

4787. **Developer for Ilford Plates.**—Fairly good, but I prefer the following, which is suitable for any make of plates:

10 per cent. Pyro Stock Solution A.	
Pyrogallol acid .. .. .	3 oz.
Sodium sulphite, pure .. .. .	2 "
Citric acid .. .. .	24 gr.
Water .. .. .	5 oz.

Dissolve the sulphite in the water, add the citric acid, and, lastly, the pyro.

Stock Solution B.	
Liquor ammonia, '880 .. .. .	1/2 oz.
Water, to make .. .. .	5 "

Stock Solution C.	
Bromide of potassium .. .. .	1/2 oz.
Water .. .. .	5 "

To develop a half-plate take solution A 1 dr., solution B 1/2 dr., solution C 1/2 dr.; water, to make 3 oz., and proceed as usual.—PEN.

4789. **Quarter-Plate.**—Watson's cameras are all splendidly made, as are Stanley's. The best universal shutter and lens are a really good R.R. and a Thornton-Pickard shutter.—PONTO.

4789. **Quarter-Plate.**—You could not do better than get one of Watson's Acme cameras, etc. This camera, with a good R.R. lens and a Thornton-Pickard shutter, is sure to please you. An Eastman roll-holder can be easily fitted. With such an outfit you can only produce a small picture. A half-plate would be much preferable.—PEN.

4789. **Quarter-Plate.**—I think Thomas Jameson has put too much in his query for a good answer, as it is quite as difficult for me to tell him the best camera, etc., to purchase as it is for him to choose. It is almost impossible to beat the Thornton-Pickard shutter for sharpness and neatness in make. As for the lens, Wray's lenses are as good as he could wish for. The camera is, without doubt, a difficult machine to choose, as all people do not like the same make and style of camera. Get a few illustrated catalogues from a few large firms.—W. H. ELLIS.

## EDITORIAL.

**SPECIAL NOTICE.**—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PHOT:

W. MAWDSLEY.—The makers supply a good plate, or try Mawson. /jll on a bright day.

HENRY SURREY.—Professor Burton's formula for a new emulsion printing paper was withheld. It is possible that it may be published in the next number of the Camera Club Journal.

NOX-ALL.—Probably Brixton Camera Club; Hon. Sec., F. W. Levett, 74, Geneva Road, Brixton, S.W.

JOHN MILNE.—We use your information in another column. Shall be glad of "Stirling" or any other "Holiday Resort" from your able pen.

JAMES A. BURTON.—Replied to by post.

MISS L. RIDLEY.—The choice of shutter depends to a great extent upon the speed desired. Dewey's Gem Pneumatic Drop is one of the simplest and cheapest. Underwood's Instantaneous is more expensive, but good. Loman's light economic is also a quick acting and very efficient shutter.

RACHDA.—The ratio values of your diaphragms are: f/14, f/26, and f/35. The U.S. numbers, 12/25, 42/25, and 76/56. The relative exposures, 1, 4, and 8.

PIMU.—1. The plate should have been backed, or the subject taken in diffused and not sunlight. The bright

sky has caused halation in the upper part. The picture is well chosen, but a little longer exposure to the print would have improved it. 2. Far superior to No. 1, though even this would have stood a little longer exposure, so as to soften down the white water; you might coat the back of the negative on the right with a little matt yellow varnish, so as to lighten slightly the heavy black shadow. 3. Good. To obtain a brown tone with development and KCl is by no means easy; we do not say impossible, but think so. We shall shortly have a leader on brown tones. Using the back combination of your symmetrical lens on so small a plate would not show curvilinear distortion; it probably exists, but would require mathematical measurements to show it; practically you are using merely the centre of the field of the lens, where distortion is least noticeable. 4. Very fine indeed; the only improvement we can suggest is a slightly reduced exposure for the print, or else the use of bromide; you have got a very fine result here. 5. Good. There is a slight want of pure black in the print, just to throw it up more. 6. Good. You know, of course, you can obtain matt-surface chloride paper, which obviates squeegeeing to ground-glass. With such work as you have sent us we shall hope to see you in some of our competitions, and, considering the time you have been at work, your results are excellent, being composed with artistic taste and backed up by technical skill. A. These plates are well spoken of, and give good results. B. Slow plates are to be preferred for general work, because there is more latitude in exposure and development. On the other hand, for dimly lit scenes, or such with very heavy shadows, the rapid are to be preferred. C. We prefer these plates, probably because we have used more than the others. D. You cannot go far wrong in choosing one of those you name. We should advise you to make comparative trials, exposing a plate of each brand on the same subject with same exposure. We are always pleased to help you.

H. LUNG.—You will find a detailed account of gelatino-chloride paper, its manufacture and toning, in the second edition of "Wall's Dictionary of Photography," pp. 101-110.

W. A. RAMSAY.—The queries are inserted. Many thanks for your good opinion.

A. H. FARMER (Melbourne).—Your photograph is to hand, and we have much pleasure in entering the same in the next monthly competition.

A. J. FULLER (Cape Colony).—The two photographs shall be duly entered for the monthly competition.

ALPERUM.—We have written to the secretary, and will advise you the result.

J. H. CLAYTON.—Certainly, by all means.

F. G. SMART.—Yours received in due course; the other is so small a matter that it was not worth mentioning.

H. HOLT.—Your work shows signs of improvement, and, in point of selection, is far away the best of yours we have seen. We must forbear saying more, as you propose to enter them for competition; none of the pictures are eligible for the "Photography at Home Competition."

H. FOV.—13. The lighting on this is far too strong from the top, and in consequence of the use of too much pyro and bromide in the developer, the high lights, particularly the cap, are too white. Your subject is looking down instead of at the flower she is supposed to be picking, and the duplication of flower forms in the dress is very painful. 14. This would have been improved by stopping down a little more; there is a little too much diffusion of focus. 15. This is better, but even here there is too much top light.

J. M.—You might try circular zinc disks inserted in the lens tube. You give us no data as to focus, so you must calculate out the necessary diameter of aperture; frequently these lenses are not strictly achromatic. Have the glasses been misplaced in any way?

J. SANDON.—If it is a white cloth you might try a very weak solution of chloride of lime, or a mixture of oxalic and sulphuric acids, 1/2 oz. of each to half a pint of water, washing well afterwards.

C. P. S.—1. The green colour is difficult to obtain, and when so obtained is not permanent; we must confess to never having tried it for a long time, and if you like to send us up half a dozen blue prints we will set to work on them. 2. In the first place your raw paper is not suitable; you want a tough, stout paper, well sized. It is advisable to use distilled water for making the solutions, which should be filtered prior to mixing. The ferricyanide crystals should be placed in a cup covered with water and stirred up once and the water thrown away; then the crystals should be dissolved. The solutions should be kept in the dark. Pour a pool of the solution on to the paper and distribute across the paper with a pad, pour on more solution and work at right angles to the lines of first movement, finally work in circles to even out all lines. 3. What you want is encaustic paste.

White wax .. .. .	500 gr.
Gum elemi .. .. .	10 "
Benzole .. .. .	4 dr.
Oil of spike lavender .. .. .	1 "
Essence of lavender .. .. .	6 "

or

White wax .. .. .	250 gr.
Benzole .. .. .	4 dr.

Melt the wax and stir in the benzole, away from fire. Let us hear from you again if you cannot get on.

W. W. H.—We had lost your address, but forward negatives and prints. Rub the negatives all over with vaseline, allow to stand in a warm place for a few hours, then place between stout blotting boards, and iron with a moderately warm iron.

AUBURN.—We do not see what advantages are to be gained by the use of celluloid, notwithstanding all that has been said in its favour. We still stick to ground-glass, and, if necessary, oil it, and use a compound focuser. As long as the celluloid will keep absolutely plane, it will be alright, but if it should buckle you can imagine what would be the result. Before advising you as to the greenhouse, we would like to have a sketch of it and ground plan, with dimensions, approximate, of glass surface, and whether you intend to devote it entirely to portraiture; if you will let us know this, we will write you by post.

A. S. R.—We have had so many baths recommended that unless you send us the exact formula, and we should also prefer a print as well, we cannot answer your question.

SYDNEY.—We do not think you are disqualified from calling yourself an amateur. Always number prints for criticism. 1. Slightly longer exposure would have improved this; a pretty bit entirely spoiled by the hideous tree across the middle. 2. Good; even this would have been improved by a little more detail in the shadows. 3. Good; a little under-exposed in the shadows. 4. See note to No. 1. You ought to get some good results from these negatives on rapid bromide paper. We have not yet tried the paper you name, though we intend doing so.

T. DONALDSON.—(1) Pull your blinds up as much as possible; if the windows are not clean, lower the top sash completely. (2) Certainly, a dish used for toning must be used for that and that only.

J. TALBOT.—(1) We cannot recommend the bath you mention; it is stated to give good tones, but they are not permanent; it is used instead of gold for toning, and requires no after fixing. (2) We place in the following order—3, 2, 5, 4, 1.

GADLYS.—Letter by post.

TOOTLES.—We return your prints, which we have numbered. (1) Good: we should have preferred diffused and not sunlight for this. (2) Not quite such a good result as 1; due to the paper. (4) Very fine, almost faultless. (5) Good, could have been improved by a couple or a figure of an old countryman walking up. (6) Good, but obviously you were too far off. (7) You were a little too near; had you pitched farther off and put an urchin angling for minnows, you would have made a picture of this. The straight line of the bridge across the middle of the plate is distracting. There is confirmatory evidence of dirty fingers. (8) Good. (9) Very good, but spoilt by your spots, etc. (10) Very fine, cut off half an inch of foreground. (11) Excellent, reduce the foreground and retouch your thumb mark. (12) Good; why did you not let children swing the gate open? (13) Good; if you would only abandon the abominable glaze and resort to matt-surface chloride paper we should prefer it. The sooner you enter for our competitions the better. You would stand a very good chance now, and, considering you are a first-year's man, your work is full of promise. Your technical skill is good.

STRONG BOW.—(1) A well-chosen bit, but utterly spoilt by the hideous colour. To see nature like this we want rose-coloured spectacles indeed. (2) Not good; you can get better results than this; see leader this week. (3) The right-hand corner of print wants breaking up; you could cut an inch off foreground with improvement. (4) Flat and poor. (5) Good. (6) Very good. (7) Good. (8) Good, but your gold bath was too strong. (9) The water wants a boat in it, and the negative would stand intensifying with mercury and sulphite. (10) Good, though over-exposed. You show considerable artistic taste and technical skill, but till you discard pink paper you handicap yourself very much. The prints are better than a great many we get in our competitions. Prints for competitions may be mounted just as you please. Always grateful for "hospital" prints unmounted.

PONTO.—Don't trifle with your lens. By altering the position of diaphragm you will increase the curvature of the field, and the results will be unsatisfactory definition at the margins. We prefer the name and address on back of "Answers to Queries," though not necessary for every one.

C. HALL.—We have a very high opinion of the camera you name, and are sure it will give you much satisfaction.

PROFESSOR.—H. and S. are not makers, and we know nothing of their lenses. The other lens you name will give you every satisfaction.

M. T. W.—The hand-camera you name is well worth the money, and we think you will be quite satisfied with the results you obtain. It is not our custom to answer by post.

T. WATSON.—Certainly send slides to us and we will criticise. Hope you will enter for the 1891 Lantern Slide Competition.

F. J. W.—Your method of washing is one certainly inclined to be the most favourable for blisters. All

solutions and washing waters should be the same temperature, about 75 to 80 deg. F. Use plenty of salt after toning, keep the prints face downwards, don't use pink paper. Try the above suggestions, and let us hear from you again.

**MANFIELD.**—Impurity of some kind in the water is the sole cause of your trouble. Try adding salt to the water; if this is no use, send us up a little water which shows the brown.

**ALPERUM.**—We have returned you a negative, which is well exposed, and which we have developed. Keep your toning bath in the dark, add fresh gold twelve hours before using, and filter just before use.

**CESTRIA.**—Your negative is under-exposed and fogged in developing, but the corner fog looks as though light had gained access to the camera somehow. Carefully examine it, and let us hear from you again.

**LOST.**—Both your negatives were simply smashed into innumerable pieces from improper packing; we are unable therefore to give you any help.

**ESQUIRE.**—We have not your name and address. (1) The choice of shutter depends upon price and speed you want. Underwood or Thornton-Pickard, or Lancaster's Chronolux all are good ones. (2) "Pictorial Effect in Photography," by H. P. Robinson; price, 2s. 6d. (3) Although the dealer you name is not an advertiser, we believe him to be relied upon. (4) Gotz, 19, Buckingham Street, Strand, London, W.C., or B. J. Edwards and Co., The Grove, Hackney, London, E., both sell orthochromatic plates. (5) Mr. Platt, Birkbeck Road, Ridley Road, Dalston, London, N., will do all you want. (1) Under-exposed and badly developed. (2) Poor. (3) Very poor. (4) Poor. (5) Camera was not level and very poor results. (6) Under-developed, flat and poor; it might have been made a picture.

**REV. CHAS. GAPE.**—(1 and 2) Insufficiently developed or else printed in the sun. The prints are flat and wanting in contrast. (3) Good as a tree study, but nothing else. (4) Good. (5) Camera not straight; more sun printing. (6) More sun-printing; the developer did not cover plate evenly. No. 4 is the only one up to standard. You handicap yourself by sun printing.

**H. H.**—One of your negatives was smashed when received. The fault you complain of is due to having some part of your subject very near and the other part distant; to obtain the near object and distance in the same sharpness of definition you must either stop down your lens or else use the side swing or swing-back of your camera.

**A. W. COOK.**—The exposure for up-river work varies of course with the light and the distance of the nearest heavy shadow from the lens, but provided there is no near shadow, and the sunlight, about one-fifth of a second would do; if with a heavy shadow, then half second. No. 1 negative is very much under-developed, and No. 2 is not quite so bad. Both negatives would be improved by intensification. The print is alright, and a gelatino-chloride paper would be an improvement for No. 2, because it increases contrast. The See-Saw shutter gives about one thirtieth of a second at the quickest, we believe, and time.

## Sale and Exchange.

**RULES.**—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

**REPORTING UPON APPARATUS.**—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SENDER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent., the minimum fee being 2s. 6d., upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible, the Editor will undertake to send a report within TWO DAYS of receipt of goods.

### DEPOSITS.

**Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.**

**N.B.**—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

**Advertisements can be inserted under a number, the name and address being registered, and letters forwarded for a fee of 3d. to cover postage.**

**Backgrounds.**—Two backgrounds, in flatted oils, 8 ft. by 7 ft., new, interior and exterior, 12s. 6d. each, bargains; cabinet photographs, two stamps; good tone violin, with accessories, cash £3, or exchange for 10 by 8 rapid rectilinear.—Hare, Photographer, Sutton, Surrey.

**Backgrounds, canvas, three interior and exterior; sell cheap.**—J. M., 203, Camberwell New Road, London.

**Biocycle.**—Great bargain. Splendid genuine Ormonde Safety, best cushion tyres, balls all over, also pedals, good as new, and warranted faultless; only £8; cannot fail to please; approval.—Safety, 18, St. Helens, Ipswich.

**Cameras, etc.**—7½ by 5 parallel bellows long-extension camera, with six double dark-slides, drop shutter, and sky shade, in splendid condition; price £9.—No. 174, AMATEUR PHOTOGRAPHER office, 1, Creed Lane, London, E.C.

Underwood's 1891 Instanto half camera, three slides, never used, perfect; 70s.—86, Albert Road, Croydon.

Whole-plate camera, square bellows, long focus, three double backs; £4 10s.—A. Taylor, Infirmary, Peterboro'.

Lancaster's half-plate 1886 Special brass-bound camera, two double dark-slides, brass-bound, in perfect order, with case; cost £5 10s.; will sell for 50s.; approval; deposit.—Geo. Elly, The Stores, Uttuxeter. Genuine brass-bound half-plate camera, swing-back, reversing frame, double extension, Russian leather bellows, moveable partition for stereoscopic work, three double slides with carriers, perfect condition, equal to new, in solid leather case; £5 5s.—Ferguson, Seaford House, Kilmarnock.

**Cameras, Lenses, etc.**—Half-plate camera, with all motions, stand (turntable), lens, three double backs (book pattern), Thornton-Pickard shutter, travelling case, to contain all, almost new, in perfect working order, also Lancaster's half-plate wide-angle lens; cost price of all, 13 guineas; exchange for 7 by 5 Kodak, or cash.—G. F. Mort, Aldenham School, Elstree, Herts.
